And nothing at all unexpected or new.

And then, there before us the bright flag is spread,
There's a roar from the grand stand and Tenny's ahead;
At the sound of the voices that shouted "a go!"
He sprang like an arrow shot straight from the bow.
I tighten the reins on Prince Charlie's great son,
He is off like a rocket, the race is begun.
Half way down the furlong their heads are together,
Scarce room 'twixt their noses to wedge in a feather;
Past grand stand and judges, in neck-to-neck strife,
Ah, Salvator, boy! 'tis the race of your life.

I press my knees closer, I coax him, I urge—
I feel him go out with a leap and a surge;
I see him creep on, inch by inch, stride by stride,
While backward, still backward, falls Tenny beside.
We are nearing the turn, the first quarter is passed,
'Twixt leader and chaser the daylight is cast;
The distance elongates, still Tenny sweeps on,
As graceful and free-limbed and swift as a fawn.
His awkwardness vanished, his muscles all strained,
A noble opponent, well born and well trained.
I glanced o'er my shoulder, Ha! Tenny, the cost
Of that one second's flagging will be—the race lost.
One second's weak yielding of courage and strength
And the daylight between us has doubled its length.
The first mile is covered, the race is mine—no!
For the blue blood of Tenny responds to a blow.
He shoots through the air like a ball from a gun,
And the two lengths between us are shortened to one.

My heart is contracted, my throat feels a lump,
For Tenny's long neck is at Salvator's rump.
And now, with new courage, grown bolder and bolder,
I see him once more running shoulder to shoulder;
With knees, hands and body I press my grand steed;
I urge him, I coax him, I pray him to heed!
O Salvator! Salvator! list to my calls,
For the blow of my whip will hurt both if it falls.
There's a roar from the crowd like the ocean in storm,
As close to my saddle leaps Tenny's great form;
One more mighty plunge, and with knee, limb and hand
I lift my horse first by a nose past the stand.
We are under the string now—the great race is done—
And Salvator, Salvator, Salvator won!

Cheer, hoar-headed patriarchs; cheer loud, I say;
'Tis the race of a century witnessed to-day!
Though ye live twice the space that's allotted to men,
Ye never will see such a grand race again.
Let the shouts of the populace roar like the surf
For Salvator, Salvator, king of the turf!
He has rivaled the record of thirteen long years;
He has won the first place in the vast line of peers;
'Twas a neck to neck contest, a grand, honest race,
And even his enemies grant him his place.
Down into the dust let old records be hurled,
And hang out 2:05 in the gaze of the world.

—E. W. Wilcox in Spirit of the Times.

Another California Horse Ahead.

MONMOUTH PARK, August 7.—And again a California horse gets there! It happens every day now, so the New Yorker gets used to it, but still he doesn't like it. No, not a little bit. This time New York's pride, Tenny, beaten twice by Salvator, ran against Firenzi, from Salvator's own stable, but as usual, he was just a little in the rear at the close.

Isaac Murphy rode Firenzi and made no waiting race. He forced the pace the moment the flag fell, and a rattling pace it was, too. Like the sulky, surly brute he is, Tenny lagged in the rear and refused to extend himself. A length and a half behind Firenzi he ran for a mile and a furlong, in spite of Garrison's efforts to send him up with his antagonist. It was a breathless, expectant crowd that watched and waited for him to make his move, and that tremendous spurt at the finish that has made Tenny famous above all other racers. It came, but as usual, a little too late. The "Snapper" got at him with whip and spur as they neared the last furlong pole, and under this by no means gentle persuasion Tenny closed upon the mare.

Inch by inch Tenny's nose moved up to Firenzi's flank, and Murphy drew his whip. He had to use it, too, for Tenny was dangerously close now, and gaining still. Fifty yards from the judge's stand Tenny's hooded head was at Firenzi's saddle girths. He fought a good fight clear to the finish and gained an inch at every jump; but the end was too near at hand, and when they dashed past the winning-post, Firenzi was a neck in front. That it was a killing time the pace shows, the mile and a half being run in 2:33¼, within a quarter of a second of the best record for the distance.

Salvator's Final Triumph.

MONMOUTH PARK, Aug. 12.—California owns the greatest race horse of this country, if not of the world, and New York at last acknowledges it. The final contest between Salvator and Tenny has ended, and Salvator to-day proved beyond all question his superiority. Not less than 25,000 people gathered at Monmouth Park to see what was conceded to be the race which should determine who is king of the turf. Twice Salvator has defeated Tenny, but winning each time by a head, and leaving a doubt in the New Yorkers' minds, naturally biased against the outsider, as to the real merits of the winner. When the second race occurred, thousands stood on the seats and hissed out their angry feeling against Salvator and cheered Tenny.

There was no such scene on the third trial to-day. The crowd's sympathy was with the home horse, but it treated the stranger fairly, receiving him with hearty cheers. Tenny, of course, was still the favorite with the grand stand, though experience had taught that grand stand favorites should not always be the favorites in the betting ring.

At last the horses were to start. Both seemed in prime condition, and Murphy and Garrison looked determined to ride for the honor of their masters and their own good names. They started with the first trial neck and neck. They rode over half a mile, neither having the advantage of the smallest nose. As they came opposite the grand stand on the opposite side of the circle they seemed to step in unison, and the great mob broke into a wild cheer.

At the three-quarter post it looked as though Tenny was a neck ahead, and when the mile was passed Tenny certainly was in the lead. The crowd was intensely excited. "Tenny will win!" "Wait for Tenny's homestretch spurt and Salvator will be lengths behind!" These and a thousand other cries came from the delighted Tennyites, while Salvator's friends looked doubtful. "There is still a half mile and Salvator may make a home spurt, too," was all that could be said.

They were within the last quarter when Salvator was seen to fairly jump out of his skin. It seemed as if with one bound he had gained a neck and thrown Tenny to the rear. From that time on the game was his. Tenny neither sulked nor lagged. Every muscle was in full play and at the highest tension, but away Salvator flew, and brave little Tenny doing his best could not keep near him. They passed the judge's eye with Tenny two full lengths behind. This time there was no mistake which horse had done his best. Salvator was the king.

The time of the race was as follows: Quarter, 0:26¼; half, 0:50¼; three-quarters, 1:17; mile, 1:43; mile and a quarter, 2:09; mile and a half, 2:35½. This settles decisively the question of the relative merits of Salvator and Tenny, and while the latter is a great horse, he will have to occupy a secondary position whenever Salvator is mentioned.

Sunol Beats a Record at Buffalo.

On August 8th at Buffalo 15,000 people went out to the driving park, attracted by the announcement that Sunol and Belle Hamlin would attempt to lower the records of 2:10½ and 2:12¼ made by them respectively. After some preliminary warming up the judges announced that the horses would be sent to beat 2:15. This was for the purpose of giving Sunol a record as a four-year-old, the best record up to date being 2:16. Belle Hamlin was sent first, her time being 2:14¼.

The California wonder, Sunol, was then called up. She passed the quarter in 0:33¾, the half in 1:05½, the three-quarters in 1:38½, and the mile in 2:11¼, just three quarters of a second slower than her California record. Considering the track, which was seemingly in good condition, and the fact that the wind on the stretch made a difference of a full second, Sunol's performance more than equals that which ranked her next to the queen of trotters, Maud S.

ELECTRICITY.—The San Jose *Times* says: The stallion Electricity is considered one of the best horses on the Palo Alto farm. It was Marvin's intention to take him on the circuit this season and give him a record, but as Electioneer is sick and his recovery doubtful, it was deemed best to take no chances in having him go wrong, as he will take the place of Electioneer. While he has no record, he has been known to step a mile faster than the average. Mr. Stanford has refused $80,000 for him.

A JACKASS CENSUS.—Jacks and jennets, or what is more commonly called "jack stock," have been taken separately from horses and mules, and for the first time, in the new census. Kentucky and Tennessee are the centers where this kind of live-stock is a specialty, large farms and millions of dollars being devoted to this interest.

THE people of Ventura have voted unanimously in favor of issuing bonds for building a new high school.

August.

Now Nature sits with folded hands,
As resting from the busy year,
While o'er the wide and teeming lands
She contemplates the goodly cheer
She gives; all energizing powers
Lie mute and still, and drowsy hours
Move noiselessly, their jocund moods
And songs foregoing; in deep woods
And fields a slumb'rous silence broods
Unbroken, save by beetle's drone
And o'erfed bees' dull monotone.
Or leaves' low rustle as they make
A pathway for the gliding snake.
The patient cows seek shadows cool,
That stretch themselves like giants prone
Along the edges of the pool—
And midst the waters stand knee-deep,
In dreamy, semi-conscious sleep.
Birds sing no more, but on the hill
The tender plaint of whip-poor-will,
Who, telling oft her woful tale,
Lingers full late after her time,
While at slow intervals the chime
Of sheep bells in the distant vale
Falls on the ear like tuneful rhyme,
Lulling the senses, till in idle dreams,
We half forget the real in the thought of that which seems. —*American Magazine.*

To the Spelling Class.

Stand up, ye spellers, now, and spell;
Spell phenakistoscope and knell;
Or take some simple word, as chilly,
Or gauger, or the garden lily.
To spell such words as syllogism,
And lachrymose and synchronism,
And pentateuch and saccharine,
Apocrypha and celadine,
Lactiferous and cactify,
Jejune and homeopathy,
Paralysis and chloroform,
Rhinoceros and pachyderm,
Metempsychosis, gherkins, basque,
Is certainly no easy task.
Kaleidoscope and Tennessee,
Kamschatka and dispensary,
Diphthong and erysipelas,
And etiquette and sassafras,
Infallible and ptyalism,
Allopathy and rheumatism,
And cataclysm and beleaguer,
Twelfth, eighteenth, rendezvous, intriguer,
And hosts of other words are found,
On English and on classic ground.
Thus Behring straits and Michaelmas,
Thermopylæ, Cordilleras,
Suite, hemorrhage, Jalap and Havana,
Cinquefoil and ipecacuanha,
And Rappahannock, Shenandoah,
And Schuylkill, and a thousand more,
Are words some prime good spellers miss
In dictionary land like this.
Nor need one think himself a scroyle
If some of these his efforts foil,
Nor deem himself undone forever
To miss the name of either river,
The Dnieper, Seine or Guadalquiver.
—*Hartford Post.*

Hugging Chains.

Written for the RURAL PRESS by MARGARET B. HARVEY.]

Some years ago I wrote an article the gist of which was this: Any woman can improve her mind if she really wishes. No matter what her circumstances, she can find a way, provided she is in earnest.

As the article was intended for a journal which circulated extensively in rural communities, I spoke particularly of the long-suffering farmer's wife. I said that farmer's wives could study languages, no matter how many children or hired men they had to look after.

Never shall I forget the storm which I brought down upon my poor devoted head. I heard from at least a dozen farmers' wives, who declared that they had quite enough to do already without bothering with languages, and that I was cruel to expect any more of them "than looking after children and hired-men." Not one of those who answered me in print had sense or imagination sufficient to perceive that I was trying to encourage them to live a little above the "trivial round, the common task." They were cruel to themselves—they were literally "hugging their chains."

I could not help being reminded of the story told by Madame Jane Dieulafoy during her explorations in Persia. She undertook to photograph a group of Oriental ladies in their harem. While Madame Dieulafoy's head was behind the camera, her models imagined that she could not hear, and indulged in a series of remarks calculated to surprise a Western mind. Among these were the following: This woman had a bad husband; he compelled her to work. What would any woman want to take pictures for if some man didn't make her do it? European men were very cruel to their wives, anyhow; some women in Europe were even compelled to be writers and scholars. There was one woman in England who was obliged to be queen!

Now, American women have long been in the habit of commiserating the degradation of their Asiatic sisters. But, according to Madame Dieulafoy, American women only waste their pity—Asiatic women would probably pity *them*, provided Asiatic women were sufficiently enlightened to know where America was.

Far be it from me to insinuate that there is any real comparison between American women and Asiatic; but knowing, as I have been forced to know, that some American women actually glory in their humiliation and resent any idea of its removal, I cannot help asking, How much better are many Western women than the majority of Eastern? It is just as easy to hug chains of gold as chains of iron.

Yes, and a chain binds us all the more effectively when we do not know that there is a chain about us; a degradation is all the more complete when we do not know that it *is* a degradation. It is when our fingers are so benumbed that they cannot feel that we are likely to have them burned off or cut off altogether.

I do not suppose that the women from whom I heard on the subject of "Languages *vs.* Hired Men," etc., were the only ones who thought me cruel when I tried to point out the way to a higher plane of existence. I have no doubt that I might find a dozen just like them in every community. But just because such women exist, exists also the need for more such articles. Plenty are written every day, but their work is not yet done.

It is only fair to add, however, that women themselves are not always to blame, even if they passively accept degradation. Perhaps, in certain senses, European (or American) men *are* cruel—the Oriental women were not far wrong in thinking that Occidental men "compelled women to work." Oh, yes! we all know that "American husbands are the best in the world," etc.; yet take a case in point.

A gentleman of means married the leading soprano in a church choir. Such a voice as hers 'twere a sin to hide—it would be nothing more nor less than burying the one talent. But this gentleman insists that his wife shall never sing in public. Why? "Because," he says, I did not marry her to keep *me!*" He thinks he is acting a generous, chivalrous part—but is he? He is depriving the world of one of its sweetest solaces and dragging his wife down to the ordinary level. This is more of an injury to her than if she actually did "keep him." But this is not all—she is "keeping him" far more by performing the duties of a housekeeper without wages than if she "let her light shine." And this brings us to still another consideration: Why does a man so often think that he "keeps" his wife, no matter what difficult, distasteful or unpaid service she may render him? Does he consider her labor of no account, or at least of no money value? Yet, strange to say, he never thinks he is keeping his seamstress or his chambermaid, even though neither of these, to use a common expression, is "worth her keep."

Would *you*, sir, consider it very generous in your wife if, because she loved you and wanted to show her pride in you, she insisted on your giving up your chosen art or profession and coming down to the level of a bound boy who worked for his "victuals and clothes"? I tell you some men's pride is a queer article. Do you know how it works? It works so that no woman, except a very rich one, can marry, even with the best and purest motives, without giving rise to the suspicion that she is marrying to "get kept."

Marrying to be kept may do for the lazy, the incapable or the unprincipled. But the idea hurts the conscientious, the gifted and the energetic. And if only rich women can marry without risking their dignity, what about the men concerned? They must either be rich themselves or else also be accused of wanting to be "kept."

This brings us around a circle. A man doesn't want his wife to sing for fear somebody will think she keeps him. But would he hesitate to marry a woman whose wealth was material, instead of artistic or intellectual, for the same reason? Scarcely. What, then, has become of masculine pride? It seems that it cannot always be counted upon as an invariable factor.

I think we are drawing near a solution of the problem. The world still worships the golden calf. If women would have their best gifts appreciated, they must set up these gifts in opposition to the golden calf. The Muses must battle with Mammon—there is no other way. That means education and culture; that means throwing off mental and moral chains.

Do I see any real signs of progress? Decidly. Only a short while ago I heard from that same article again, which revived the whole matter. A lady told me that she had found a five-year-old number of a certain journal, which contained some of the most encouraging words that she had ever read, etc. If they were encouraging to any one when they first appeared, no one thought it worth while to tell me so. I am scarce afraid to add, however, that some of the original readers and critics would understand better now.

For the last few years we have been reading (and writing) articles telling how to manage housework, etc., so as to have time for intellectual development. But now the question is going up all over the land: "Why waste so much time and strength over housework, etc., when intellectual development is the real business of life?" We have been unraveling the skein by the wrong end.

Intellectual development is the real business of life—of every woman, married or single, as well as of every man. Housework and every other kind of work are but means to this end—if you choose to take a homely figure, they are but the axle-grease to keep the wheel in motion. Of course the wheel can't go without the grease—but the wheel, after all, is many times bigger than the axle. But we have been purblind as to the revolutions of the wheel, and have occupied ourselves mostly in smearing our fingers with grease.

It is safe to say that we are nearing a period when the world at large will recognize the great truth imperfectly embodied above. New conditions or improved machinery will relieve mankind and womankind of the wearing grind of labor, converting what is left thereof into an art or a pleasure. Studying languages then will be a recreation and a duty, not a mere accomplishment or task—and so with similar pursuits. The next generation will wonder, pityingly, why the women of this era washed and cooked, just as we wonder why our grandmothers spun and wove. Why, this is all in the line of regular progress. The carpenters and blacksmiths of to-day have outgrown the tools of twenty-five or fifty years ago. If men don't continue to hug their old chains, why should women? Why, indeed?

Edenic Living.

EDITORS PRESS:—A little treatise entitled "The Edenic Diet" has fallen into my hands. The book bears the date of 1889. The doctrine in this particular shape may be much older. It is new to me, probably owing to my not being fairly astride the Pegasus of the world's progress.

I have long been acquainted with the doctrine of the plain Vegetarians, but the "Edenic Diet" goes farther. His idea is to eat only uncooked grains and fruits. The first advantages that he claims for this diet are: That you will have no doctor's bills, no cooks nor cooking utensils, and will lose no time in looking after the cook.

Now I would be glad to enjoy all these advantages, except, perhaps, the last. I never regret the time lost in looking after the cook. Indeed some of the pleasantest memories of my life are connected with the time that I have lost in looking after the cook.

The author says that a woman friend prayed for a pair of shoes, and the answer came: "Live on Edenic food." She did so, and in a week had saved enough to buy a pair. I endeavored to impress the value of this suggestion on the cook. She acknowledged its wisdom but seemed inclined to doubt its practicability. I advised her to come to it gradually; to eat cooked oatmeal, rice, etc., and by degrees taper up to whole grains of wheat, and finally to white-oak acorns, as the latter abound hereabout and would be very cheap. She might thus be able to get a pair of cheap stockings, too. The plan—like all the great schemes for sudden riches which I have from time to time evolved—ended in failure. The cook started in at breakfast the next morning on oatmeal and milk, but after the next course, consisting of buttered toast and sweet pickles, even while the chilblains on her toes were impelling her on to the higher life, the lashes of her eyelids drooped and she expressed her sentiments by saying: "My dear, please pass the sausage."

The author also says that many persons have yet to learn that the hunger which they feel is not always their own, but that it is communicated to them from other persons near by or at a distance, especially when the latter, while hungry, are thinking of them. He says, also, that invisible beings can and do communicate the sensation of hunger. This, I presume, is also an argument in favor of the Edenic diet; for a person living on that sort of food would not probably be bothered to any great extent by his hungry friends, which would also be a saving. But on the other hand, if any of my friends at a distance should be thinking of me, I should feel very bad to refuse to eat a good dinner if it would be of any benefit to them.

I do not know, however, if it is exactly the polite thing to be making sport of what a man has written in all earnestness. He says many things which are full of truth; but it seems to me that he is visionary, and to a man full of beef and warm coffee he looks like a crank. He mixes up astrology with his raw grains and chestnuts, and expects you to swallow that, too. He talks about publishing some charts by which he proposes to show how those who follow his teachings can get to heaven—or, in the author's own words, "to oneness with the Divine itself."

It is evident to all inquiring minds that we are approaching a great social revolution. When Mr. Edward Bellamy's scheme of governmental control of all departments of industry is realized, and all the people have learned to live the Edenic Life, surely the millennium will have come! ANTONY RILEY.

UNANSWERABLE.—Anxious sister (to brother just returned from a sparring lesson): Oh, Jack, don't learn to fight in that brutal way. If you want to perfect yourself, take lessons in fencing. Jack: Yes, but if I was attacked I probably wouldn't have a foil with me. She (triumphantly): But you might not have your boxing gloves, either!—*Jester.*

CENSUS ENUMERATOR—Is your husband an American by birth? Mrs. Roney: Yis, sorr, he is that same. He has a berth in the police department.—*Munsey's Weekly.*

"In a Minute."

[Written for the RURAL PRESS by S. P. SNOW.]

A minute is but a short space of time, and yet often much is accomplished therein—much of happiness, much of misery. It is often the turning-point of life. The results of all future time, nay eternity itself, are sometimes determined by the cast of a single minute. Principalities are founded, kingdoms established, empires crumbled to dust; but all this is foreign to my story.

She was a winsome child as one would see in a long June morning ramble. She was loved by all. No one saw her but to admire and praise. She was eminently beautiful. None could help loving her. Her bright, sunny, golden hair glinted like the sun's rays through the maples in the autumn breeze, and it curled in her neck and about her ears like the split stalks of the dandelion. Her plump lips were as the cherries, red. Her cheeks displayed the faint tinge of the early morning, Aurora, for which she was named. Her forehead—no alabaster could be whiter or fairer. Her bright, sparkling, azure eyes were ever laughing, ever merry and gay. But the beauties of person were utterly eclipsed by the transcendent charms of her mind and temper. She was all patience, all submission, all sweetness and love. She was not strong or robust; on the contrary, she was weakly, nervous, often ill and suffering severe pain. But all this she bore with so gentle resignation and quiet fortitude as to draw praise from all who witnessed her distress. It touched the hearts of the most stoic and indifferent and made all most anxious to relieve her misery, if it were possible. As time rolled round it finally became evident that she must be deprived of her mother's milk; it did not agree with her; it added to her nervousness and weakness. But this was a serious consideration. It was her chief, her almost only solace. She had never even gone to sleep but upon her mother's breast, and to deprive her of all this seemed to the fond mother like depriving her of all joy and comfort, and it was long and with many anxious communings with her own heart before she could make up her mind to attempt the unwelcome task; but it must be done; the baby's, as well as her own welfare, demanded it.

The first twenty-four hours, baby bore it like a martyr. She moaned a little, but evidently thought that time would soon bring her the so anxiously coveted food. But she was still doomed to disappointment. "In a minute, in a minute." The mother had often made use of this expression in answer to baby's wants. This would always be answered with charming resignation, and baby would wait, although the minute would sometimes, in the various routine of household duties, be protracted to a most unconscionable length. "In a minute, in a minute." Thus would baby say, and show every sign of intense hunger. "In a minute, in a minute," wailed baby, and exhibited utter loathing for every other kind of food but its mother's milk.

Talk of the evanescent character of the sufferings of childhood. Grown people can suffer the extent of human agony, and do it with fortitude. They can lose fortune, friends, reputation, and do it with equanimity, for they have resources of mind and heart unknown to the child. They know that a fortune can be regained, new friends made, even a lost reputation patched up if the character is still intact; but a child has none of these resources. Its sorrows are keen and unassuagable, its misery and distress incapable of relief. "In a minute, in a minute," and the tears fairly rained down the pale cheeks of the mother, for she knew it was never more, never more. "In a minute, in a minute," and the tone was now one of utter despair. Even hope had perished. It seemed as if the child would wail itself to death, that the extent of human agony was reached, and that death must surely intervene unless the mother would sacrifice, temporarily, right and duty; and even then, the final catastrophe would but be postponed, not averted. But the faithful mother held firmly to her integrity, and beheld, with silent agony, the despairing struggles of her infant. Had the child displayed perverseness of temper, instead of such angelic sweetness and resignation, it would have been easier borne, but it was all unmitigated suffering. "In a minute, in a minute." It seemed impossible for the child to sleep. When almost completely tired out, she would fall into a half-doze, lisping inarticulately, "In a minute," to start up again, with every sense keenly on the alert, to repeat again and again, "In a minute, in a minute."

And thus it was for an entire week, "In a minute, in a minute." But time, the great healer of all human ills, eventually brought relief; misery was assuaged, grief covered up, and happiness returned. Baby is now a bright, strong, healthy child, but we will never, never forget, so long as the breath of life remains, the concentrated agony of the look, the wail "In a minute, in a minute." And the "minute" to that child was an eternity.

Santa Barbara.

CONVERSING UPON THE SUPERNATURAL.—Dumley (impressively): 'Pon my word, d'ye know if I—aw—should see a ghost I believe I should become a—aw—chattering idiot. Miss Quicker (softly): Do tell us about the ghost you did see, Mr. Dumley.

Young Folks' Column.

Henrietta's Tramps.

[Written for the Rural Press by Katherina Bryant Nolan.]

Leigh Chalmers came out of the back door of the family residence and walked down the veranda steps with firm strides and a dogged, sullen look on his little square face. His brown eyes that always looked so clear with a certain pride and strength portrayed in their depths, were hidden by two deeply fringed lids.

Leigh never sat still when things were not going as they should go to please a boy. He went off and planned up something entertaining.

His mother was away, and he had only been allowed to have two doughnuts and he felt the need of three. No wonder he was cross; it was most certainly a trial, and, moreover, it was cold comfort to be reminded of the sufferers in the great siege of Paris and the deprivations they endured. Leigh liked history very well indeed, but he liked doughnuts better.

However, there was no help for it, so he wended his way calmly and philosophically across the street and went up the driveway, between the lawn decked with bright and nodding blossoms, and the garden, where samples of vegetables of every kind grew and flourished. Variety rather than quantity was the object of the owner of that vegetable garden, and certainly he produced some prodigious examples of what could be done in the gardening line, even in Massachusetts. Leigh lived almost under the shadow of the State-house, for you could see its gilded dome plainly from the roof of the Chalmers homestead, and Boston was really only just across the Charles river.

"Come in, Art," Leigh called out, as he neared the barn back of the house and caught sight of his friend and companion; "let's go over to Hogs-back." Art laughed as he looked at Leigh's stern face, but he joined him and they went through a side gate into Capt. Slocum's beautiful grounds. They raced along down the driveway, until they reached a back gate which let them out into a swamp, where tangled blackberry bushes, minus the blackberries, and various brilliant tantalizing flowers grew just out of reach. Leigh waded in after some of them one day, but a pair of black, scratched, poisoned legs had rewarded the effort, so he very readily agreed to keep out of that swamp for all future time.

If there was one thing above another that made up for Leigh Chalmers' deficiencies of manner, it was this fact: he could be depended on to keep his word, so "his word was as good as his bond."

The day before this eventful one they had stood on the edge of the swamp and dexterously shied stones in among the Captain's choice hens and pullets. The yard was small, the cackling was great and the feathers flew wildly. It was cruel sport, as the poor things were helpless, so they hurried through the yard, as they did not wish to meet the Captain, and ran along the path that skirted the swamp and up on the steep, long hill called Hogs-back because it resembled nothing so much as the sides of a fat hog, especially when one raced along the broad, flat back and looked down on either hand. All of a sudden their footsteps made a hollow sound.

"Leigh, hear that," said Art, stopping to stamp his heel.

"Yes, I hear. There is a hollow place underneath, I suppose. Henrietta says the Indians built this. It is a mound," Leigh answered.

Henrietta was a walking encyclopedia, and so Leigh was an authority upon all subjects. Anything that a boy wanted to investigate received attention from Henrietta, whether it concerned relics of Indians or birds and gaudy butterflies of the living, moving present hour. Many a boy envied Leigh on account of that wise sister of his.

They had now reached the end, which shelved down straight into a hollow that was sparsely filled with trees and rustling dry leaves and dry branches.

"Come on, Art, let's build a fire. I've some matches," said Leigh.

Both boys fell to gathering sticks and leaves until they had a goodly little pile, and then it was but the work of a moment to set it ablaze. They piled on the brush and scraped up the leaves, running hither and thither until it seemed as if there were half a dozen boys instead of two. That fire, how it crackled, how it roared!

All of a sudden it appeared to Leigh's excited fancy as if there was a regular Western cyclone blowing, and the grass began to catch fire, sending out little creeping tongues of flame in the direction of the Captain's picket fence and fine lawn.

He took off his jacket in a flash and fell to beating those mischievous, curling, dancing imps with an energy which swelled his little heart almost to bursting. The heat was nearly suffocating, the roar in his ears quite maddening, but he kept at it. Art seemed paralyzed for a few moments, but at length he fell to work with his cap and sticks and stones. It seemed an aimless effort to Leigh, but he had to work, he could not stop to talk.

The fire was making very good progress indeed, when two men ran up with shovels and beat it all out in much less time than it would take to tell it.

The boys' faces were black and streaked finely where the perspiration had streamed down and cleared their skin; their hands were blistered and a sight to look upon; Leigh's jacket was ruined, and Art's white flannel cap, a black, disreputable affair.

The men went off to their work in a neighboring market garden, chuckling over the punishment those youngsters were sure to receive when the tell-tale garments met the eyes of their natural guardians.

Art looked at Leigh, and Leigh looked at Art. It was plainly no case for delay, so Leigh started up Hogs-back hill and Art followed somewhat reluctantly.

"Merciful heavens! what have you two boys been doing?" asked Henrietta, when they opened the gate in the boundary fence between Captain Slocum's grounds and Art's home.

To say that the boys considered Henrietta a guardian angel stationed to lead them into a path of safety at a desperate crisis, is expressing their feelings mildly. She stood there with compassion upon her face and listened to their story just under a big maple close to the gate.

Leigh related their adventure with great vividness and neglected to mention the fact that he had started the fire himself. Art twirled his blackened cap on one of his fingers and looked sympathetic as he ventured a remark occasionally that tended to make the narrative strong. The narrow escape of two brave boys from a tragic death filled her mind and the trifling detail of the cause of the bonfire never entered her head.

The news spread, and relatives and neighbors filled up all needful gaps with their own versions of the harrowing tale. The boys were washed, their burns dressed, and strict commands were laid on them to keep out of that swamp, as there were tramps who not only set fires but killed boys or carried them off for a ransom.

Captain Slocum was moved to forgive them for stoning his hens, as he realized they had done him an inestimable service when he surveyed the blackened and smoking circle by the hill. He owned that he had kept "a fine rod in pickle for them," but declared he should not use it.

Art and Leigh never stoned his hens again, and were very, very careful where they built bonfires after that time, and were proud of Henrietta and lauded her more than ever, as her tramps saved them from two merited punishments they were thankful to have escaped.

Good Health

How to Drink Milk.

Don't swallow milk fast and in such big gulps. Sip it slowly. Take four minutes at least to finish that glassful, and don't take more than a good teaspoonful at one sip.

When milk goes into your stomach it is instantly curdled. If you drink a large quantity at once, it is curdled into one big mass, on the outside of which only the juices of the stomach can work. If you drink it in

Little Sips,

Each little sip is curdled up by itself, and the whole glassful finally finds itself in a loose lump made up of little lumps, through, around and among which the stomach's juices may percolate and dissolve the whole speedily and simultaneously.

Many people who like milk and know its value as a strength-giver think they cannot use it because it gives them indigestion. Most of them could use it freely if they would only drink it the way I have described, or if they would, better still,

Drink It Hot

Hot milk seems to lose a good deal of its density, you would almost think it had been watered; and it also seems to lose much of its sweetness, which is cloying to some appetites.

Milk vs Beer.

If the poor only knew and appreciated the value of milk taken in this way, I am sure there would not be so much beer-drinking among them. There are thousands of hard-working scrub-women, wash-women, factory girls and even shop girls, in this city, who drink beer with their meals because it gives a little stimulant to their tired bodies, and don't understand that it is only like applying a whip to a weary horse, instead of giving him oats. If they only knew, they would find in this simple draught as much strength as in a barrel of beer.—*New York Tribune.*

A Remedy for Burns.—"A celebrated German remedy for burns," according to the Detroit *Free Press*, "consists of 15 ounces of the best white glue broken into small pieces into two pints of water and allowed to become soft; then dissolve it by means of a water bath and add two ounces of glycerine and six drachms of carbolic acid; continue to heat until thoroughly dissolved. On cooling, this hardens to an elastic mass, covered with a shining, parchment-like skin, and may be kept for any length of time. When required for use, it is placed for a few minutes in a water bath until sufficiently liquid, and applied by means of a broad brush. It forms, it is said, in about two minutes a shining, smooth, flexible and nearly transparent skin."

Influenza and Faith Cure.

The impression seems to be gaining ground that faith cure and mind cure and all the cognate cures are much more effective when there is nothing the matter with one than when the body is really ill or diseased. An illustration of this recently occurred in Jersey City, where a well-known citizen had been an ardent believer in and advocate of the faith cure. He had gone so far as to build a chapel and dedicate it to the cause, and had impressed the wonders of faith cure upon his family; but one day the influenza came along, and as it entered the door the faith cure flew out of the window. The "grippe" was too much for faith, and the doctors had to be summoned.

No one will attempt to deny the influence of the mind over the body in many cases, nor the reflex influence of faith or prayer or any other outward demonstration. There are certain maladies of the body which may be reached more readily and effectually through the mind than in any other way, but from this it does not follow that all diseases are curable in this way. The cardinal mistake of the Christian Scientists and of the believers in faith cure and mind cure is in denying the existence of things which are palpable to the senses; of confounding the phenomena of consciousness with those of volition, and of insisting that all afflictions of every kind are subject to the control of the mind or will.

Modern science is sufficiently eclectic to recognize the great value of mind cure or faith cure in its proper sphere, but the pseudo-science which asserts the power of performing miracles is so narrow and bigoted as to deny the therapeutic qualities of any and every kind of medicine, though demonstrated by years and even centuries of experience. When the time comes for the crucial test, however, those who are not fanatic on the subject will yield their opinion to the skill of others, and if they do not they show themselves devoid of reason and common sense.—*Ex.*

The Gila Monster.

One of these dangerous, lizard-like reptiles was exhibited alive at a meeting of the Academy of Sciences a few weeks since and attracted considerable attention. This reptile is no doubt of a very dangerous character, especially when angered. An Arizona ranchman, by the name of Vail, was recently riding in the neighborhood of his home, when he espied one of these reptiles in the road, and alighting from his horse, killed it as he supposed. He tied the carcass to the back of his saddle and resumed his journey, but soon had occasion to place his hand in the vicinity of the animal, which instantly seized one of his fingers with such a vise-like grip that it could only be removed by having its head literally cut to pieces, which was done by an Indian who accompanied him. The gentleman himself immediately cut the flesh of the finger to the bone, just above the wound, and tied a string tightly around above the cut. He then rode for life to the nearest railroad station, 25 miles distant, where he procured a locomotive and rode 40 miles farther before he was able to secure medical aid. By that time nearly the whole of his body had turned black, and the physician gave him no hope of being able to restore him, although he did congratulate him upon his good sense in refusing to drink whisky at the start as the Indian advised him to do—for that, he said, would have ended his life very speedily. Hard work and the application of the best remedies, at last brought the patient around, however, and he is probably the only man living who is able to relate his own experiences in being saved from the usually fatal bite of a Gila monster.

Their Weakness.—The superstition about woman's relative weakness begins to show itself in the training of children. Girls are ludicrously guarded against exercise that they need as greatly as boys, and at every critical period of their life thereafter they pay in suffering for the misguided consideration of those who had their training in hand. The so-called "lady-like" demeanor of girls is a thing to excite impatience. Girls brought up in strait jackets of physical propriety—physical freedom will hurt nobody's "manners"—can never have the grace of deportment, the variety of poise, the readiness in emergency that will belong to girls of liberal physical training.—*Checkley's Method of Physical Training.*

The Electric Light as an Insecticide.—But few are aware of the enormous destruction of insects effected by the electric light. A German entomologist has been investigating and reports that he has found as many as 33,000 are destroyed in one night by a single globe light. Insects must be more plentiful in Germany than here to furnish such an item. But there is no question but that the electric light might be made of great use in destroying many noxious insects which infest our gardens and fields. Mosquitoes, however, and grapevine pests and the pestiferous potato-bug seem to be too wise to be thus ensnared. The chief species which succumb to the wiles of the electric light are gnats and midges.

Domestic Economy

Unexpected Company.

My husband had gone to town to be gone all day, the children were at school with their lunch-baskets, and I had decided to put in a good day sewing and take a lunch at noon myself. As I sat stitching away, with no thought of misfortune or calamity, the clock struck twelve and simultaneously I heard the "crunch" of carriage wheels on the gravel drive at the side door. I looked out the window and to my consternation saw five persons alighting at my door. They had driven twelve miles and must have some dinner.

I welcomed them, explained the situation, and after a brief chat excused myself to prepare a meal for them. In the pantry I took account of stock. There was one slice of cold bacon left from breakfast and the drumstick and wing of yesterday's chicken; there was also one cold boiled potato, a hard-boiled egg, two slices of bread in the bread jar and one cookie and half of another in the steamer. Fortified by these resources, I cheerfully built a fire, and in fifteen minutes I had made a lovely chicken pie, scalloped the potato, adding one cracker to make more of it, and had toasted the two slices of bread and cut them in strips so as to make them go round. I quartered the cookie and a half, and laid on each quarter a slice of the hard-boiled egg, making a novel and attractive relish. At the last moment I found a sauce-plate full of jam which had been set away from tea the night before; this I turned into my cut-glass preserve dish, feeling as if it were quite a treasure. Then, just fifteen minutes from the time I left the parlor, I summoned my guests to dinner, first running out into the garden for a cabbage plant and a few graceful onion tops for a bouquet, for our roses were all gone and the annuals were not yet in bloom. I was quite proud of my menu and the quickness with which I had prepared it, but though fifteen minutes seems a short time in which to build a fire and bake a chicken pie, yet when one plans her work carefully she can accomplish a good deal in a short time. My guests ate heartily, saying the long drive had given them great appetites, and congratulated me on my delightful dinner.

The above is all a lie, every word of it, but it is exactly as true as the nonsense of the same kind one reads in housekeeping treatises and domestic columns of some newspapers. It makes me downright mad to have such stuff written for practical housekeepers by women who I know never cooked a meal in their lives, and who aspire to teach those who have practiced all their lives how to live economically. You cannot make something out of nothing in the culinary line any more than you can in any other way; and the idea of getting up a meal for three or four out of scraps an able-bodied tramp could not fill up on makes me sick. If people must write fiction I wish they would choose something else than cooking—something they know a little about, something not quite so hopelessly prosy and commonplace—as a theme for their romance.

Nine-tenths of the stuff one sees in papers, household magazines, etc., professing to teach women how to keep house and dress well on nothing a year, how to furnish a room with blue denim carpet and cheese-cloth ceiling, how to make a chicken pie out of a slice of cold ham, is written by women who never put their fingers into dough, drove a tack or hung a picture in their lives. A canary bird with a good appetite could not live on the tin soups and dainty "croquettes" they seem to consider so "fillin'," and their economies make me think of the story of the man who was always nagging his wife because she could not cook as economically and at the same time as palatably as his neighbor's wife. "Why," said he, "we had boiled carrots with some sort of sauce the other day, and they were delicious. When have we had a carrot, I'd like to know! And so cheap! Mrs. ——— said enough for dinner only cost her two cents." Madam had boiled carrots at two cents for next day's dinner and her lord and master would not touch them. Why couldn't she have made a sauce for them like Mrs. ———? So next day she got the recipe for the sauce, and they had carrots again, this time meeting the full approval of the man of the house. Then she showed him the bill: Carrots, two cents; ingredients for sauce, including tarragon, curry, and half a bottle of French dressing, 78 cents. Then he shut up.—*Brunfille, in Michigan Farmer.*

Corn Pudding.—Cut from the cob three pints of tender young corn, add three fresh eggs, beaten very light, two heaping tablespoonfuls of butter, salt and pepper to taste, and one teacupful of sweet cream. Bake for one hour.

Custard Pie Without Milk.—Wet a heaping tablespoonful of cornstarch with cold water, add boiling water till it is as thick as thin cream, beat two eggs, add three tablespoonfuls of sugar, put in the cooked starch, beat well, flavor to taste, and bake as usual.

Deviled Chicken.—Cut the remains of cold cooked chicken into neat pieces, dust each piece lightly with cayenne and salt. Put a tablespoonful of butter in a chafing-dish, when hot add two tablespoonfuls of stock or milk, put in the pieces of chicken, and when thoroughly heated, serve.

The Week.

Admonitions of coming rains continue. The heavy downpour last week at San Bernardino is followed this week by light showers at several valley points and by thunder and hail-storms in the Sierra. There is therefore all the more reason to heed our previous advice and get everything to cover which can be hauled and to get covers to everything which must stay afield. Let the play this year be for safety as far as possible; dried fruit is too valuable to be spoiled.

The fairs progress, the San Jose display being on view as we write, and Napa and Red Bluff to come next week. Preparations for the State Fairs of California and Oregon continue, and interest increases as the chosen days of September draw nigh. The Mechanics' Fair, which comes late this year, promises to be unusually good, and will be aided in its work by the State Floral Society and the State Pigeon Society, each of which will occupy a week in displaying its cherished favorites of leaf and feather.

Political affairs are still warmer. As we go to press it is announced that Col. H. H. Markham has been chosen Republican candidate for Governor.

Choice Dates Coming.

We have frequently shown by word and engraving the successful fruiting of the date palm in several localities of California, and have urged that we should have in this State some of the improved varieties developed in the date countries around the Mediterranean, because all plants that have thus far fruited in California are seedlings of the dried date of commerce. The date has varieties of marked individual characteristics in size, form, quality and time of ripening just as other fruits have varieties, and to grow only seedlings is, of course, not a high state of horticultural practice. The difficulty in introducing these improved date varieties arises from the fact that choice kinds can only be multiplied by taking the offsets of the original trees, as the methods employed in multiplying exogenous trees do not apply to the palm. The securing then of rooted offsets and transporting them here in growing condition is rather more of an undertaking than an individual has cared to embark in. It is a proper field of effort for the Government, and we were pleased to announce recently that Secretary Rusk had approved the plans of Prof. Van Deman, the pomologist of his Department, to secure date plants of approved variety abroad. This undertaking has fortunately been successful, and the plants have arrived in this country, as the following extract from a letter from Prof. Van Deman, addressed to the University Agricultural Experiment Station, will show:

The first lot of dates was composed of nine trees (three trees of each kind) and came from Biskra, Algeria. They arrived at Philadelphia July 4th and in Washington July 9th. They are five or six years old and were taken from the ground where they were planted by the Arabs, the outer leaves having been cut off about three or four feet from the ground, and then planted in a box of earth. They are in excellent condition, but a new scale insect was found on them. We are keeping them here in order to destroy these insects by a treatment with kerosene emulsion.

The second lot arrived in Philadelphia a few days ago from Cairo, Egypt, and at Washington this morning (July 24th). There are 54 in this lot, all planted in tubs and in excellent condition. There are six trees of eight of the choicest varieties known in Egypt and six male trees. They have been gathered from different parts of the country, and were intended for the British colony of Mauritius, but that government decided not to take them and our Consul-General at Cairo bought them for the trifling sum of $200. These trees are infected with a scale insect and they will be kept here until the pests are killed. It will perhaps be early in September before we consider them safe to send West. There is in all about a carload and we will endeavor to have them watered en route so that they may reach their different destinations in as good condition as they are now. I think we can say that the choicest varieties of the date will be safely planted in the date-growing sections of this country this year.

I have also ordered plants from the region of the Euphrates and Tigris rivers through our Consul at Beyrout, and another collection of the choicest varieties of Persia through our Minister at Teheran. These perhaps will perhaps be received within a year.

Prof. Van Deman is certainly entitled to the thanks of our horticulturists for his intelligent and energetic movements in this matter. We understand that the importation of date plants is to be divided between California, Arizona and New Mexico. Those for this State will be sent to the University Department of Agriculture, and will be planted at the outlying stations which afford conditions most promising for the date—chiefly, probably, at Tulare and at Pomona. Here they will be fruited and will serve as centers for propagation, whence the new plants will ere long be distributed to other favoring localities. The incoming of these dates will be one of the most interesting events in our horticultural history, and may be in the future considered of great significance. Perhaps now that the practicability of securing these choice varieties is demonstrated by the Government effort, there will be a disposition among private growers to secure importations. We trust it may so prove, for trials should be made at many places which cannot be reached by the present acquisition.

John Bidwell gave an order recently for 30 000 boxes to pack his raisin crop of 1890.

Selling Butter in San Francisco.

The Santa Maria dairymen, whose intention of organization to protect their interests was recently mentioned in the Rural, held their preliminary meeting on August 2d and arranged for a permanent organization to be perfected at future meetings. The *Graphic*, commenting on the meeting, remarks: "The dairymen appear to be thoroughly aroused on the subject, and at the next meeting it is expected that a plan whereby their interests will be subserved will be presented and adopted.' We shall await with interest an account of what such action shall be.

The dairymen have succeeded thus far at least in drawing out a statement from a leading commission firm of this city concerning their methods of doing business and the reason why some butter is returned to the producer at a less price than is actually secured from the purchaser. As this subject will interest all producers who sell in this market, we quote from the letter read at the Santa Maria meeting as follows:

We think it is right for any commission merchant to return the full market price for all and any goods that are consigned to him, and the market price is whatever price he can obtain for a round lot sold as it arrives to the close trade; just the same as the price of wheat or barley is what round lots sell for from the wharf as they are shipped in, and not the price that they are jobbed for in small lots from the store.

Five per cent for selling butter to the close trade, which requires very little expense to reach, is a good margin and will pay well; but no commission-house in San Francisco could ever keep their shippers if they were compelled to sell only in large lots and to the closest trade, who really represent the market. We send our travelers all over the country, and their selling costs us from 2½ to 5 per cent. Add to that the discounts that we allow for cash from the country, always one per cent, sometimes two, and you see that we must ask this country trade from one to two cents per pound more for butter than the close city trade, and from one to two cents more than the market price.

The fact of the matter is, that this extra jobbing price that we get is on account of the close competition between the various butter-houses here, divided with the dairymen, and in some cases entirely given to them.

This statement seems to indicate that the practice of some commission men at least is to return to the producer what they consider a "round lot" price for his butter without regard to what is actually obtained for it as it is sold by the box to the purchaser. If this is what is meant and what is defended in the above letter, it indicates that the commission merchant really speculates in the butter, returning to the producer what the merchant conceives to be a "round lot" price and pocketing the difference between this figure and what he actually obtains for the produce. The writer says that this margin is "divided with the dairymen and in some cases entirely given to them," but that does not matter particularly so long as the practice is defended that the merchant shall credit the producer at one figure and sell at another. The difficulty seems to be due in part at least to the fact that so many commission merchants are dealers on their own account as well and in such a case the temptation to take both profit and commission from a lot of produce is almost irresistible. This whole subject is of deep importance to producers and we are glad they are beginning to look into it.

A General Discussion on Fruit Drying.—A very timely subject will be up for discussion at the August meeting of the State Horticultural Society, which will be held at the State Board of Trade, 605 Market street, on Friday, August 29th, at 12:30 P. M. The subject will be "Fruit-Drying" in any or all of its branches, and it is hoped that all who can will attend, whether members of the society or not. It will also be in order to exhibit especially specimens of prunes fresh and dried, that a better knowledge can be had of the varieties now being grown under different names. There are several varieties now grown under the name "Robe de Sargent," and if they can all be seen together, it may be possible to make out their differences and resemblances. Leaf and young wood should be shown as well as fruit. Mr. J. L. Mosher of San Jose is expected to exhibit samples of the japanned wire trays which he is finding very satisfactory, and others are invited to exhibit fruit-drying appliances. The meeting should be a large one.

The World's Fair Site.

There is more trouble for the World's Fair Directors. After quieting the Illinois agriculturists, whose opposition to a dual site was described recently in the Rural, the Directors have received an opinion from their expert that the Jackson Park site is suitable only for a temporary display of giant squashes and other things which will not shake or wiggle in their places. The expert was the celebrated Frederick Law Olmstead, who is known to California for his work at Golden Gate Park, the University at Berkeley and the Stanford University sites. He was instructed to ascertain to a nicety what space is available for the exposition buildings at Jackson Park without interfering with the park purposes. He reported the ground examined by him would be available only for such buildings as could be removed after the exposition. Furthermore, the park he declares to be unsuitable for a live-stock exhibit or for showing agricultural implements in operation. He explains that the Jackson Park site is swampy and that to utilize more than 112 acres of floor space for even temporary buildings would seriously interfere with the plans of the Park Commissioners for the permanent levee and bayou system with which to resist the encroachments of Lake Michigan. The park never would give satisfactory sites for halls for machinery or for railroad, electric and mining exhibits, and for such objects as are included in what is generally called the main exhibition building. They would be suitable for an agricultural hall.

It looks as though this decision would give the directors considerable trouble, and may result in the re-choice of a site, in which case it may be possible to find ground which will be more pleasing to all interested than selections hitherto made. This will be, on the whole, a satisfactory solution of the matter.

The Beet-Sugar Industry.

The interest in beets for sugar is well maintained. It is reported that the crop at Watsonville is a good one, and the probable aggregate larger than last year, which will give the factory a longer run. Improvements at the factory have been advanced, and a well yielding an almost incalculable amount of water has been secured. Operations are expected to begin about September 1st.

Various points at the South are making preliminary records with sample beet-growing from seed furnished by Mr. Spreckels and Richard Gird of Pomona. Analyses of these beets show in some cases a gratifying sugar percentage and purity co-efficient and lead naturally to much talk about the establishment of sugaries. The venture which just at present seems nearest realization is at Santa Monica, of which the Los Angeles *Express* gives the following rumors:

It has been learned from a thoroughly reliable source that Senator John P. Jones has instructed the foreman of his Santa Monica estate not to plant it to grain this year. In his letter of instruction, Senator Jones informs his foreman that he has consulted with Claus Spreckels, and that the latter is highly delighted with the sugar-beet production of Santa Monica. Mr. Spreckels has agreed, so the letter states, to join Senator Jones in the erection of a sugar factory at Santa Monica.

Reportorial Wisdom.—One of the city dailies, in what purports to be a report of the last meeting of the Floral Society in this city, indulges in this outburst of wisdom: "General discussion ensued on the use of water in gardens. There was very little difference of opinion regarding the application of water to growing plants in the evening or early morning, although the exact amount of water to be used for different plants was different in the opinion of several of the delegates." The fact is that the subject, though down on the program, was not taken up for discussion at all. The reporter drew simply upon his notion of what "might have been," and such, according to the poet, are the saddest words of the pen. It is especially sad in this case that the reporter did not proceed to develop from his inner consciousness whether each plant should have a teacupful or a gallon, instead of leaving the reader in such a harassing state of doubt as to what his practice should be.

A Suit Against Nurserymen.—It is announced from Oakland that Maurice Kahn of Winters has sued a firm of nurserymen for $25 000 damages for selling him some fruit trees that were not of the variety that he ordered. He says that he ordered 1000 Royal apricot trees and 500 Lovell peaches, and that the fruit is now bearing, after three years, and finds that all of the trees, save 73 apricots, are of an inferior kind of fruit.

Florist and Gardener.

Vines for Home Adornment.

[An essay by Mrs. M. M. Childs of Santa Barbara, read at the August meeting of the State Floral Society.]

I take it for granted that every one wants the plant, be it shrub or vine, which will give the most satisfaction with the least care. In an experience of 12 years, during which time I have led a very busy life, I have sought to gather about my home a little of everything; finding that some things would not thrive even in a favorable climate, I have submitted to their loss. But among those which, although neglected, will thrive and beautify their surroundings, I find *Tecoma jasminoides* may always be depended upon, and I believe there is not a spot in California where it would not grow, except where the ground freezes. It is a vine admirable in all its points; slender stems, yet self-supporting; a rampant grower, yet of good shape; glossy, firm foliage, but not too dense; has large, pure-white flowers with deep rose-color in the tubes, each flower about one and one-half inches long and two inches across. From three to six open in a cluster at once; by the time they have fallen, as many more take their place, making the plant seem a mass of bloom. The flowering season continues about nine months of the year, perhaps more, while the lovely foliage is perennial. The flowers are admirable for loose bouquets in vases, being so arranged on the stems as to give them an airy effect.

The next among my favorites is *Mandevillia suaveolens*. It is not so suitable for arbors or large trellises as is the Tecoma, or climbing rose, as it only reaches a hight of some 10 or 12 feet. The foliage is pretty while it lasts, but the vine is denuded of leaves during the three winter months, when it rests. The large, pure white, fragrant blossoms, several in a cluster, with long stems, are particularly nice for vases. If the flowers are left on the vine, each one forms a pod about 10 inches long, looking like an attenuated bean pod, which when ripe is filled with a cream-colored silky substance, in which are imbedded the numerous brown seeds. The self-sown seeds make strong plants the first year, bloom the second year and thereafter as long as the vine lives. Mine is now about 12 years old, but I do not know how much longer it may continue to thrive. It is a plant which is always admired and is willing to take care of itself.

Adlumia cirrhosa is a delicate vine from the wooded mountain copses of the Alleghany mountains. It is often called the "Alleghany vine;" it might more properly be called the lace or fringe vine. The rich, smooth, green, lively cut foliage resembles our *Cheilanthes Californica*, or Lace Fern. It rarely grows above six or eight feet, and flowers the second year from seed. Its delicate pink bells resemble in shape the Lily of the Valley, but are much smaller. My experience is that self-sown seeds make the best plants. It must be grown in a cool, shaded place; it seems most at home among ferns, and I should think the climate of San Francisco just suited for it, if protected from the heavy winds. It is to me an old friend, like Dielytras, Peonies, Lily of the Valley and Lilacs; these I must have about me, although they take a long time to adapt themselves to our soil and climate. I am obliged to keep Dielytra roots in boxes under the coolest shaded side of the fern-house (made of lath), because the slugs soon destroy them unless properly protected.

Ficus repens is a most friendly and useful vine for covering a high-division fence between city lots; it never looks untidy, never pleads for food nor pruning, clings to the wall without being fastened, and makes a solid mass of small green leaves tinted with bronze.

The Virginia creeper (*Ampelopsis quinquefolia*) ought not to be overlooked, its new growth is so pretty, the delicate tendrils dancing with every passing breeze, like a hummingbird on the wing. It is pretty in youth and charming in its old age, as its matured leaves turn to several shades of scarlet and wine-color on the approach of our rainy season (we in California can scarcely say "as winter comes on"). Edward Rowland Sill, in one of his beautiful descriptive poems, said of our winter-time: "Where hyacinth buds bloom white, for snow."

There are dozens more of beautiful vines for covering large spaces, among them the Passifloras (or passion vines) and the Tacsonias; they are very graceful and beautiful if used to cover a dead tree or an old building, and are largely used in the southern part of the State for division fences or a covering for such, and are easily pruned and kept within bounds.

Commercial Floriculture in California.

At the July meeting of the California State Floral Society, a committee was appointed to assist the National Census Bureau in securing an accurate report of the Ornamental Horticultural Industries of California. The following is the report as presented at the August meeting:

Your Committee on Census Report beg to submit the following estimates, as required by the Census Commissioners of the United States:

Acres devoted to floriculture in California	300
Square feet of glass	500,000
Value of implements	$15 000
Number of horses employed	100
Total value of establishment	$200,000
Number of men employed	1,000
Number of women employed	150
Average wages, men, per day	$1.50
Average wages, women, per day	$1.50
Annual cost of fuel	$2,000
Number hardy plants annually grown	3,000,000
Number other plants annually grown	1,000,000
Total amount plant sales in 1889	$1,500,000
Total amount cut-flower sales in 1889	$150,000
Per cent of stock sold at wholesale	50 per cent
Per cent of stock sold at retail	50 per cent
Wholesale catalogues annually issued	50
Retail catalogues annually issued	200
Average amount paid for postage	$500
Average annual amount of freight bills	$2,500
Average annual amount of express bills	$1,200
Freight and express bills on outgoing shipments	$1,000

Commercial manures are rarely used in California; a few florists use bonemeal to some advantage.

Plants most successfully cultivated are: Roses, carnations, geraniums, pelargoniums, chrysanthemums, violets, camellias, azaleas, fuchsias, begonias, tube roses, dahlias, amaryllis, jasmine, stephanotus, bulbs of all kinds, diosma, laurestinus, myrtle, pittosporums, magnolias, araucarias, eucalyptus, caprenus, lilacs, palms, snowballs, clematis, oranges, lemons, annuals, pansies, ferns, dracoenas, yuccas, heliotropes, tree peonies, etc.

Cut flowers most in demand and most profitable are: Roses, pinks, chrysanthemums, violets, sweet peas, orchids, camellias, azaleas, tube roses, lilacs, lilies, eucharis, hyacinths, asters, magnolias, to which should be added smilax, asparagus and maidenhair fern.

In regard to the question "if the business is on the increase or decrease" the committee is of the opinion that the business is increasing in volume, but decreasing in profits, which is due to the employment of cheap labor such as Chinese, Japanese, and Italians, by extensive growers.

Concerning diseases and insects most troublesome, we find mealy bug, red spider, scale, green fly and mildew the most disastrous; and the most approved remedies are sulphur, tobacco and whale-oil soap.

The above estimates and calculations cover the entire State.

F. A. Miller,
E. L. Reimer,
John Rock,
Committee.

ENTRANCE TO THE GARDEN OF THE GODS, COLORADO.

The Garden of the Gods.

The illustration on this page shows the entrance to the famous Garden of the Gods, located near Manitou Springs, Colorado. In the foreground, as shown in our view, are seen the massive walls of red sandstone rising on either side of the opening to the hight of 100 or 150 feet. The wall was originally continuous, but has been worn through by erosion. In the background, through the opening, may be seen the snow-capped summits of Pike's Peak, rising to a hight of 14,000 feet above the sea level. Of this locality, Prof Hayden writes as follows:

This interesting and peculiar place is a valley in the foothills of the range, and is inclosed by an almost vertical wall of massive sandstone of Cretaceous age. The rocks which we find inside have been subjected to an immense deal of erosion, and the many ridges and tower-like forms left standing throughout the garden are the remnants of the parallel strata which dip to the northeast at a very great angle. In some places they seem to dip a few degrees in the opposite direction. As we go toward the mountains, the dip decreases. These rocks are fine-grained sandstones of a deep brick-red color, with here and there layers and spots of a lighter red, and sometimes white. The ridges are exposed for some distance to the north, while to the south, after bending toward the East, they appear to be covered by the debris from the mountains. The entrance to the "garden" is through the "Beautiful Gate," an opening through one of the highest ridges of red sandstone.

Notes from the Fairs.

Ione—26th District.

A representative of the *Record-Union*, who went up on the 6th inst.—the second day of the 26th District Fair—on an excursion train from Sacramento, found the little town of Ione thronged with visitors.

At 11 o'clock there was a stock parade at the fair-grounds, a very creditable display of horses and cattle, showing that the people of Amador are taking a deep interest in the raising of fine stock.

The races in the afternoon embraced four running events, and visitors to the Park were treated to sport as fine as one could wish to see.

The track was in superb condition, owing largely to the energy and industry of Pres. U. S. Gregory and Sec'y Lagrave of the District Association, who were untiring in their efforts to make the fair a success.

The Exposition hall had been handsomely decorated by the ladies of Ione and was a marvel of neatness and attractiveness. It contained a splendid exhibit of the products of Amador miner, quarries, farms and orchards, and was embellished with the panoramic bird's-eye view of the county that graced its display at the State Fair.

San Jose—5th District.

The San Jose *Mercury* of Aug. 12th says:

The annual fair of the San Mateo and Santa Clara County District Agricultural Association, No. 5, opened yesterday morning. The association is assisted in the organization and management of the fair by the Santa Clara Valley Agricultural Society, under the presidency of Wm. Buckley, efficiently aided by Sec'y Geo. H. Bragg. All the noted stables have gathered their strings here, and the contests in the various events will be close and exciting. The program of races has been carefully arranged, so as to afford good sport and excellent opportunities for all classes of horses to show their mettle and speed.

A reporter of the *Herald* who visited the fair-grounds on the opening day noted two or three dozen coops of splendid fowls there; a herd of nine Jersey cattle belonging to John Connorr, on the Saratoga road; Col. Younger's celebrated herd of Shorthorns, 17 head, from little calves to a monstrous bull, all in the finest order.

The Cook stock farm at Danville, Contra Costa county, shows two fine stallions, for all purposes. Mr. Harris also exhibits two. David Abell of Austin, Nevada, shows two running horses.

C. B. Polhemus has a herd of nine demure-looking Jerseys.

Geo. B. Polhemus has a herd of 18 Holstein-Friesian cattle.

F. H. Burke of Menlo has a herd of 18 Holsteins, one Poland-Angus and one Hereford, three or four fine horses, and four pens of Berkshire hogs, one of which is a sow with pigs littered yesterday. They are very cute.

A few pens of sheep and hogs arrived about noon. The stock exhibit has hardly begun yet. The preparations are extensive enough to accommodate a very large display.

AGRICULTURAL NOTES.

CALIFORNIA.

Alameda.

GRAIN.—Haywards *Journal*, Aug. 9: The yield in this section is naturally light. The highest yield so far received is 24 sacks to the acre, but the average will be much below this. Still the quality of grain makes up for the light crops.

Butte.

BUNCH OF GRAPES.—Chico *Enterprise*, Aug. 7: We were shown at General Bidwell's office yesterday a bunch of grapes which measured 20 inches in length and 25 inches around the butt. We did not learn the weight of this bunch, but it is larger than the one shown last year, which weighed 14 pounds. Two years ago a bunch from the same vineyard weighed 18 pounds.

Contra Costa.

GRAIN CROP.—Martinez *Democrat*, Aug. 9: The grain crop in this county is turning out a great deal better than was expected, and our farmers are beginning to recover somewhat from their despondency. We are informed that the yield in the neighborhood of Brentwood and Byron will be larger and of better quality than ever before; also that the grain in Ygnacio, Pacheco and San Ramon valleys is of a better quality, and the yield far in excess of the most sanguine hopes.

LARGE CROPS.—Martinez *Gazette*, Aug. 9: The Marsh grant, we are told, will raise this season enough wheat to load three ships.

Fresno.

DRIED PEACHES.—Selma *Irrigator*, Aug. 9: Paris Allen brought in a four-horse load of dried peaches that netted 6720 pounds, for which Mr. Allen received a check for $1144. This includes about three-fifths of his present crop from nine acres of peach trees. This is more than $200 per acre, and allowing $50 per acre for all expenses, will leave a net profit of $150 per acre.

DRIED GRAPE PURCHASING. — *Republican*, Aug. 8: When M. F. Tarpey told a *Republican* reporter a few days ago that he would give 3½ cents a pound for all dried wine grapes in the county, he was laughed at by some of the bystanders. But Mr. Tarpey meant what he said and left a large margin of profit for himself when he offered 3½ cents a pound, for the packers at the same time were offering 3¾ cents a pound for dried wine grapes in the sweat-box delivered at the railroad depot in this city. This is equal to four cents a pound stemmed and in the sack. A prominent vineyardist was offered yesterday 3¾ cents a pound in the sweat-box for the entire product of 450 acres of wine grapes. This offer was made at different times by three different packers.

WHEAT.—Fresno *Republican*, Aug. 8: Good shipping wheat was quoted yesterday in this market at $1.15 a cental, and milling wheat at $1 20. It is estimated that the yield of this county will be between 210,000 and 220,000 tons, one-fifth more than that of last year.

HAY.—*Republican*, Aug. 8: J. V. Curd has shipped several carloads to Arizona from down the valley during the past ten days. The demand seems to equal the supply, and prices for grain and bald barley range from $9 to $10 per ton. Alfalfa (baled) is held at $8. He has no means of estimating the yield of the county, but does not think there will be any large amount for shipment.

Humboldt.

HAY AND GRAIN.—Eureka *Standard*, Aug. 7: Hay-making is in full blast, and as the brilliant orb of day steals its way o'er the eastern hilltops you can hear the click of the hay press which is busy under the management of Herrick, Haley & Co. These gentlemen are handling an immense crop of first-class hay. When this is baled their services will be required by other farmers who wish a good job done in short order....The grain crop promises a good yield, and in a few days the self-binding harvester will be brought into active use.

Kern.

LIVE-STOCK. — Bakersfield *Echo*, Aug. 7: More roads are crossing the Great West, and each new iron link brings us nearer to the Eastern markets, and it cannot be long before Arizona and New Mexico stock can be sent East as well as West. With the coast market left to California, Oregon and Nevada, and the demand greatly increased by the creation of foreign markets, prices must rule higher. It is evident, too, that the phenomenal growth in fruit culture must affect favorably the stock-growers in the hills and mountains. With more meat-consumers and fewer meat-producers in the valleys, the stock-raisers who continue in the business will find greater demands for their products.

Los Angeles.

GRAPES.—Pomona *Progress*, Aug. 7: We know of contracts that have been made here for the full crop of wine grapes on the vines at $13 and $14 a ton, and we know of some vineyardists who have contracted to sell their crops to the grape driers for $8 and $9 a ton on the vines.

DRIED FRUITS.—L. A. *Herald*, Aug. 9: In six weeks past a Monrovia firm has cut 500 tons of apricots and has shipped 16 carloads of the dried fruit. It has purchased already 850 tons of peaches, which are now being dried, the first carload of which will be sent East to-day. It has also purchased for the same purpose 600 tons of French prunes, and will dry about ten carloads of grapes. It employs 240 men and takes care of 40 tons of fruit each day.

BIG IRRIGATION PROJECT.—L. A. *Herald*, Aug. 9: Up in Antelope valley there are about 300,000 acres of land. Some of this is under cultivation, but a good portion extends into the Mojave desert and bears cacti and coyotes as its principal crops. Col. W. C. Alberger saw the valley and the contiguous so-called desert, and he hunted up a dam-site and now is hard at work with all the men he can get, excavating in the canyon of the Big Rock creek, or, as the more melodious Spanish name is, "El Rio de Llano." He found there a site which will require a dam 250 feet wide at the bottom, 600 feet at the top, and be 150 feet high, which will receive the water from a shed of 250 square miles. The site is only 15 miles from Alpine. The importance of this work is immense to Los Angeles county. The cost of the dam will be about a million dollars, besides that of the construction of a large system of canals and conduits.

BETTER SHIPPING FACILITIES.—L. A. *Express*, Aug. 9: The Santa Fe Co. has ordered a lot of refrigerating cars to be used the coming winter in shipping early fruit and vegetables to the East.

SUGAR.—L. A. *Express*, Aug. 9: A few days ago Senator Jones shipped from Santa Monica a carload of sugar beets to San Francisco, and upon analysis they were found to contain from 12 to 20 per cent saccharine matter. Sugar beet averages from 20 to 30 tons to the acre in production, and nets the producer about $7.50 to the ton. It only costs about $40 to plant some 30 acres, so the enormous profits can be readily computed. With this immense showing it is safe to reiterate that sugar-beet culture will soon have a productive hold on this county.

Mendocino.

HOPS.—Ukiah *Democrat*, Aug. 8: G. T. Rhodes of Ukiah valley will commence picking next week. Encouraging reports reach us from all the hop-growing sections of the county. The crop promises well.

Modoc.

VOLUNTEER WHEAT.—Alturas *Independent*, Aug. 7: John B. Linderman, a Surprise valley farmer, was in to see us last Monday morning, and told us of volunteer wheat that is growing on his ranch. Mr. Linderman is 6 feet 2 inches in hight, and says the wheat is as tall as he is. The other day he counted out of curiosity, and to his astonishment found that from a single grain of wheat there were 135 good plump heads, averaging six inches each in length.

Napa.

GRAPES.—St. Helena *Reflector*, Aug. 10: The dried grape market is stiff this week, large sales having been made at 3¾ cents per pound. A grape-grower of Fresno made a contract yesterday for 1400 tons at the above price, which will net more than $15 per ton. Over 100 tons of grapes were engaged in this vicinity last week at $12 per ton. Another party has also started in buying at $12. A Rutherford grape man, we understand, has refused $12 a ton for his grapes. In Yolo county $13 per ton are paid for Zinfandel grapes, which is $4 per ton higher than this time last year.

Nevada.

SEVENTEENTH DISTRICT FAIR — Grass Valley *Tidings*, Aug. 8: The Directors of the 17th Agricultural Fair Association have decided to postpone the date of opening the fair from the 19th inst. to Sept. 231. Fruit will be abundant along in the middle and latter part of September, and our growers will be enabled to make a large and interesting exhibit. Farmers, too, will be better prepared to meet the occasion and viniculturists will have no excuse for a poor display.

Orange.

WALNUT SALE.—Anaheim *Gazette*, Aug. 7: Mr. Gillman's walnut crop was sold yesterday. The crop is estimated at 40,000 pounds, and the price paid is said to be over nine cents a pound.

Sacramento.

HOW TO BUILD LEVEES.—Sacramento *Union*, Aug. 6: Engineers of much experience in revetment work say that the repair of the cave in the levee at the foot of W street should not be made with broken granite alone. That may slide down and out if the bottom is insecure; but if brush is mixed with the heavy material it will hasten the accumulation of deposits and thus tend to rapid rebuilding of the face of the levee from the foundation up to the surface.

San Benito.

HAY AND CATTLE.—Hollister *Advance*, Aug. 8: Splendid crops of hay are reported from the Gabilan. A. S. Perley has just finished hauling, and the report is that the average yield was three and a half tons to the acre. How is that for mountain land? Cattle are looking well and feed is still plentiful.

San Bernardino.

DRIED FRUIT SHIPMENTS, ETC.—Ontario *Record*, Aug. 6: The Ontario Fruit Company has shipped 87,500 pounds of dried apricots, about 44 tons, making four carloads. That means at least 260 tons of green fruit. We understand that E. G. Naramore of Cucamonga has sold his dried apricots for 15 cents per pound, and has been offered the same figure for dried unpeeled peaches.

San Diego.

FAIR, GRAPES AND IRRIGATION.—*San Diegan*, Aug. 5: The horticultural fair will be held at El Cajon Hights on the last Thursday and Friday of August. The prospects for a very large yield of grapes were never so flattering before, and as the acreage is three times as great as in former years, the crop of raisins will be at least that much larger than ever before. A great many raisin-growers are now using flume water to irrigate with, and they report the result as very encouraging. The vines are healthier and the grapes are larger and better in every way.

RAISINS.—Aug. 7: It is estimated that the raisin crop of this county this season will be 350,000 boxes, 200,000 of which will come from El Cajon. Chicago dealers have contracted for all the Cajon crop, paying 25 per cent over last year's prices.

STEALING BARLEY.—San Diego *Sun*, Aug. 9: Six men, who have been traveling about Perris for the past few days under the guise of showmen, were arrested yesterday, charged with stealing barley. Great quantities of grain are known to have been taken, and much excitement is said to prevail among the farming community there.

San Joaquin.

GRAIN-SELLING. — Merced *Argus*, Aug. 9: Owing to the good prices prevailing, the movement of the new grain to the bay is steady and increasing as the season advances. Farmers prefer to sell at fair figures rather than to hold for possibilities of futures and pay interest and charges.

Santa Barbara.

GRAIN CROP — FRUIT PLANTING. — Santa Maria, Aug. 9: There will be a fair average yield of grain in this section and the bean crop is looking well. Between 500 and 1000 acres of deciduous fruit trees will be in full bearing next season in addition to the existing orchards.

Santa Clara.

PRUNE AND DRIED GRAPES.—Mountain View *Register*, Aug. 9: Last week, John Snyder of Mountain View sold his prune crop, ungraded and on the trees, for nine cents a pound. Buyers are endeavoring to make contracts with the grape-growers in this section for dried grapes at 3½ cents a pound.

Santa Cruz.

BEET FACTORY AND WATER.—Watsonville *Pajaronian*, Aug. 7: Not much is heard now about poor-looking beet crops, but much is heard to the contrary. There are some fine beet crops in Pajaro valley this year, and several farmers expect to have crops that will surpass the previous record of tonnage per acre. It is expected that the beet factory will start up about September 5th, providing enough beets are on hand to insure a steady run. Beet hauling will commence about Sept. 1st. The big well at the beet factory is all finished and in shape for the season's work. At present 170 gallons of water per minute is flowing over the coping. When pumping begins this supply will increase to 700 gallons per minute, or 1,000,000 per day.

Solano.

HARVEST WORK.—Vacaville *Reporter*, Aug. 7: Farmers are not rushing now. Their grain is thrashed and in the warehouse. Their hay is in the barn, except a few stacks left in field for fall sale. Straw engages their attention now. They will take care of all they have this year and be short then. Straw is a good substitute for hay for stock in the winter. Those practical farmers who combine stock with farming find it pays to stack their straw under sheds. Some have straw all hauled in now.

Sonoma.

GRAPES.—Cloverdale *Reveille*, Aug. 9: Cook & Langley have contracted for over 800 tons of grapes at $8 per ton, paying $1 per ton in advance. Their plans are to dry the grapes for the raisin market. The making of raisins out of the wine grape is rather a venture, but there is a market for cheap raisins, and this opens up a new avenue by which to dispose of the overplus wine grapes.

FRUIT CROP.—Santa Rosa *Democrat*, Aug. 9: The fruit crop in Sonoma valley has been greatly influenced this season by the late warm weather and also by the excessive moisture of last winter. The peach crop, as a whole, is a failure, only a very small percentage of last year's shipment being sent to market this year. Probably 50 per cent of the young trees on bottom land were killed, as well as many on higher ground. The majority of the crop this season is small and wormy. Apple trees, although not killed like the peach trees, are affected. The yield is not up to the average either in quantity or quality. The fruit is acid, small, and like peaches, very wormy. Hardly any have been shipped yet on account of the lateness of the crop. The plum crop is varied. In the upper portion of the valley there appears to be a very good yield, although late, while in the lower portion there is scarcely any. On the "Eden Dale" farm, where last year large shipments of plums were made, this year hardly one is to be found. The fruit is of very good size and quality. Pears are very light, affected by worms slightly, but are of very good size and appear to be ahead of the rest of the fruit. Grapes are plentiful and promise a fine crop this fall, and will be cheap. The past few days of warm weather have hastened the ripening. The Tokay crop, however, has been slightly damaged, much being burned by the scorching heat. The vineyardists are holding the latter very high, refusing to accept $50 and $55 per ton in several instances for the entire vineyard.

Stanislaus.

IRRIGATION DITCH.—Oakdale *Leader*, Aug. 8: Work on the Oakdale irrigation ditch is rapidly nearing completion. Nearly 75 men are now employed on the force. At present teams are scarce, but if enough horses can be secured the scraper work will be completed by October 1st. The balance of the work will consist in building flumes and repairing the dam, which can be done in a short time.

Sutter.

HAY.—Y. C. *Farmer*, Aug. 8: The tule grass in the southern and western part of the county is reported to be excellent this year and will add considerable to the hay crop of the county.

Tulare.

WHEAT SHIPMENT.—Tulare *Register*, Aug. 8: There is at the present time an average of 150 carloads of wheat daily going into Lathrop from points along the division. This number of cars is all that is available, though three times as many could be brought into active use.

GOOD GRAPES.—Tulare *Register*, Aug. 8: P. D. Fowler came into this office this afternoon with a box of the finest grapes we have seen. There were three varieties, the Purple Damascus, Seedless Sultana and the Muscat. One of the bunches presented evidence of a queer freak of nature. It had ripened lying on the ground and when Mr. Fowler went to lift it he was surprised to find that it stuck there. Investigation showed that the stems of the bunch had sent forth roots several inches into the ground. The roots were still on the bunch when brought to this office.

BAD FEATURE.—Hanford *Sentinel*, Aug. 7: J. T. McJunkin informs us that a man near Traver, in the Alta irrigation district, was about to make a loan on his land from a city bank, but when the title was presented it showed the incumbrance of an irrigation-bond mortgage for 20 years, and the bank refused the loan, giving as a reason that it did not make loans on second mortgages. This is a new feature of the results of the Wright Irrigation law.

HARVEST AND WHEAT PRICES.—Traver *Advocate*, Aug. 7: Harvesting is pretty nearly over in the 76 country. Some of the farmers of large tracts will not be done for several weeks yet, and there are several small farmers waiting for the thrashers, but the bulk of the crop is harvested and the warehouses are having a lively time handling the grain, which crop has been very heavy even for this, one of the best wheat-growing sections of the State..... Wheat is quoted in the local market at $1.13@ $1.15 per cental. This is a good price, considering, and a great deal of grain is being sold. Although wheat is not ruling near so high as fruit, it seems that both wheat farmers and horticulturists are going to make something this year.

Yolo.

WHEAT.—Woodland *Mail*, Aug. 9: A. K. Robinson, a thrashing-machine man of many years' experience, and who has been thrashing for the past 30 days in this county, says that he had never thrashed wheat of so poor a quality as this year's yield. He says the wheat is shrunk, and in some instances much cheat is found.

Yuba.

FEATHER RIVER BREAKS.—Phil E. Drescher writes to the Marysville *Appeal* Aug. 7: The river now stands five feet —— inches. I made the examination and find that the Indian mound break is 150 feet wide. The water has cut a slough in the original bank ten feet deep, extending from the bank for 200 yards. The water stands now in it near the river-bank from three to ten feet deep, but is not running. This break is at a place where the course of the river forms a right angle, and below it the river is the narrowest between its mouth and the mouth of the Yuba. About one-half mile below the Indian mound break, at a point where the railroad embankment comes within 400 feet of the bank of the river, is another break 70 feet wide. The water has cut a slough 12 feet deep in the original bank. The water in it is on an average 7½ feet deep, and is still slowly running. Of the trestles of the railroad opposite this break, three piles have been washed out. It is painful to notice the destruction last winter's high waters have wrought to the old Nelson farm, the ground which has been torn up and the sand carried into the Sutter basin. I do believe that last winter's waters have carried more sand into the Sutter basins than all previous high waters from 1849 down.

NEVADA.

TWO CROPS.—*Lyon County Times*, Aug. 7: "Old Man" Barrett of Mason valley is doing something this year that has probably never been done in this State before. He has raised one fine crop of potatoes already this year, and is now planting a second crop, calculating that he will have plenty of time to harvest it. He is using for seed the potatoes that he has already raised this year, which are of the Early Puritan variety. If he makes a success of his venture, it will be quite an item for Nevada, and will show how wonderfully productive the soil of our State is.

ORCHARD PEST.—Reno *Gazette*, Aug. 7: Insect pests are playing havoc among the fruit orchards of Reno, and numbers of orchard owners are taking energetic steps to check the scourge. The fruit trees especially attacked seem to be of the apple, pear and cherry varieties. The leaves curl up over a great portion of the foliage, and upon examination are found to be swarming with tree lice. Many fine trees had already died before the extent of the evil became known.

[COMMUNICATED.]

AN OPEN LETTER.

STEAM PLOWING.

The Remington-Daniel Best Traction Engine.

To the Editor of the Farm Implement News:

Noticing your article "Steam Plowing," with a sub-head "Price's New Steam Locomotive" (the data for which you evidently had to rely upon Price), in your June number, allow me to say that the article in several of its parts, if not throughout, is misleading in the extreme. But the most prominent misleading feature of it is the attempt to make the public think that this Price machine is the great Pacific Coast machine, while the truth is, it is mine ("The D. L. Remington Machine"), with improvements made at the Daniel Best Agricultural Works at San Leandro, California.

By a cunning use of the word "type" in the article, the reader is left under the impression that everything that has been done by the "Remington" and "Improved Remington" had been done by the "Price Machine." A brief history of the "Remington," with improvements, and a statement of what it has done, will facilitate an understanding of the matter.

In 1885, I turned my attention to the construction of a traction engine, and with the crude appliances at hand in my "country shop," I in time turned out a small, roughly made engine, but one that worked beyond even my own sanguine expectations when put into the woods logging and into the field plowing and to general work. Subsequently, I made another and more complete one. This one, which I named "Rough and Ready," I took to California, arriving at San Leandro with it in March, 1888. Great crowds assembled almost every day for weeks to witness exhibitions of this machine, made in the neighborhood of Daniel Best's works. Its performances were truly astonishing and "Rough and Ready" was pronounced a grand success by all, and all included some of the most competent judges of such machines on the Coast. At this time I sold to Mr. Best the right to manufacture these engines on the Pacific Coast, and from that time forward he has been turning them out to the full capacity of his establishment and selling them as fast as they were finished.

The main feature of these machines, that is, the things that give them their great power and speed, remain the same as in the original machine and are my inventions. Mr. Best has made improvements, but these it is not necessary to mention in detail here, and he now offers to the public the handsome and powerful machine shown in the picture on this page and of which Crocker's Railroad Guide for 1890 says:

"For simplicity of construction it cannot be equaled. There is absolutely not a superfluous piece of iron or wood about it. It stands a trim, clean-limbed, *muscular*, steam-lunged, iron-ribbed giant, ready to tear up the earth with twelve 12 inch plows, running to the beam, at a tireless speed that would soon exhaust a hundred horses. And then in due season, with a 40-foot-cut Steam Harvester (if one so wide is required), to go into the field again and reap and thrash and clean and prepare for the market more than a hundred acres of grain in a single day. It is not a ponderous, unwieldy machine. It is just heavy enough to do the work required of such a machine, and its tractability is something wonderful. It will move in every direction, back and forth, in a circle, and in all imaginable curves, and turn a square corner with the same ease that a railroad locomotive can move back and forth on the rails, and it can climb as steep a hill as a team of horses can with a loaded wagon. It is truly the latest great improvement of the age." The performances of my engines well warrant the use of these strong words.

In your article it is said: "This question naturally arises in the minds of those who have given attention to steam plowing, 'Why does this type of engine show so much better results than any other?' for it is true that locomotive steam plowing has nowhere been a practical every-day business, except in California." To this, Mr. Price replies as follows: "Because in this machine are combined in a skillful manner certain features which have never been united in a field locomotive before."

Now the truth is that all the things done about which the wonder is expressed in the question, were done by the "Remington" engines. When the question was printed in your paper "this machine" of Price's was still in Racine and had not even started on its journey to California. And yet Price deliberately breaks the commandment and insults the intelligence of the people of the Pacific Coast, acquainted with the facts, by saying, by an artful twist of words, that all the great achievements of the traction engine in California are because "in this (his) machine are combined in a skillful manner certain features that have never been combined in a field locomotive before." What machine? let me ask. My query, "What machine?" lays bare in all its baldness the attempt on the part of Price to mislead. By "this machine," he must mean his. If he means mine, I take it all back. But the otherwise uninformed reader could come to no other conclusion from the reading of the paragraph than that he was to believe that his (Price's) machine and no other had "the combinations, etc.," that had worked the wonders spoken of.

Let us see. About a year before I took "Rough and Ready" down from Oregon, Price put up at the Daniel Best works a traction engine under a contract with the city of San Jose, California, to furnish an engine to crush bituminous rock on the streets of that city. No one will ever dispute Price's claim to this "type" of engine. I don't think anything like it was ever conceived by mortal man before or since. It was a travesty on all mechanical ideas and it was ridiculed by everybody that saw it. He took it to San Jose and struggled there with it three or four days to make it go, but failed. The thing was condemned by the authorities of San Jose and ridiculed and laughed out of the town by the papers and the people. The San Jose *Daily Mercury* of October 13th, 1887, contains a column editorial lampooning the abortion most unmercifully, and in one paragraph says: "It is a failure, was the verdict of every one that saw it, and the more the endeavors to make it go the stronger becomes this impression."

De LAFAYETTE REMINGTON, PROPRIETOR WOODBURN IRON WORKS, WOODBURN, OREGON.

In other parts of the *Mercury* article it is said:

The Price roller — price, $4000 — is still in town, although a rumor was current yesterday forenoon to the effect that it had been taken to the infirmary to mash potatoes for the invalid patients. As a matter of fact—and it is the purpose of this article to deal solely in facts—early yesterday morning the men from San Leandro adjusted the "tempered" springs, got up steam and coaxed the roller to slowly jerk its way along to San Pedro street. * * * *

Shortly after it started a gentleman whose name is suppressed out of consideration for a sick uncle who lives in the south of Ireland, placed a piece of brick in front of one of the big wheels. The engine puffed and snorted, and the unwieldy machine bucked and teetered and jerked and rasped and strained and worried. The brick was twisted and turned up. More steam was applied, the engine groaned piteously, the wheels slipped, the machine trembled and rattled, and, finally, by a great effort, the hardened clay was conquered and the roller jerked its weary way along. * * * *

"Do you expect to be able to start it up again in the morning?" inquired the reporter.

Mr. Price replied that he hoped to be able to get it started, but did not appear to be at all confident of success.

Provided the machine is repaired and it isn't shaken to pieces by its own motion, or mischievous boys don't throw pieces of brick and fruit in its way, it is possible that it may be induced to crawl as far as Santa Clara street before breaking down to-morrow.

Again, I quote from your article as follows: "Mr. Price enumerates many more points which, combined with the foregoing, go to show why his engine accomplishes more than others have done hitherto, but want of space prevents their insertion. He concludes his summary of them by saying that, applying the ordinary methods of computation, his machine shows 100-horse-power nominal."

Then, after going on in a long paragraph to claim great power for his machine, he says: "These machines in California work nearly the year round, first plowing the ground and sometimes (by means of seeders attached to the plows) sowing the grain; then, by the use of traveling threshers, harvesting and threshing it, and, finally, hauling it on wagons to the nearest railroad station. As they do this work for about one-fourth the cost of the use of horses, plowing the ground for 50 or 60 cents per acre, and harvesting and threshing the grain for even less, we look upon them as machines of great importance to certain sections of our country."

Again, I ask in the name of the spirit of fairness which should animate all men and pervade all business competition, What engine is "this engine?" and what machines are "these machines?" Surely not the machine that was standing in the shop at Racine when the article was written, and was and is the only one of "this type" manufactured by Price, a "type," by the way, of which he had not the most remote idea until he had seen "Rough and Ready" and grasped its parts and dimensions. Surely, it was not "this (his) machine" which never did a stroke of work in California. Why did not Price tell that the "Remington" engine had done these things and that he had tried to make one as near like it as he dared and hope to evade the law? But nowhere in the article is Mr. Best or myself mentioned or the engine manufactured by us, and all fair-minded people must regret the unfairness shown by this evidently *designed* suppression of such mention—this concealment.

My object in publishing this article is to give the craft and those outside interested in such machines the facts about my engine and "this (that) machine" of Price's. The achievements of my machine have indeed been wonderful, and so they have been pronounced by the most competent judges, and it stands to-day, I believe, with due deference to other older inventions, *par excellence* at the head of all traction engines in the world, and I wish to claim the honor due and to see that I get the profit as well. I don't intend, if I can help it, to let either be purloined from me. And I am glad that your article has given me the opportunity to let the country know in this way more fully that it is my traction engines, as manufactured by me and by Daniel Best, that have done the work in California that has made this method of cultivation an assured success, mechanically and financially.

I will be pleased to answer all inquiries asking for information in regard to my engine and for full information as to what these machines have done in California. I refer the reader to Daniel Best, San Leandro, California. D. L. REMINGTON.

Woodburn, Or., July 30, 1890.

THE REMINGTON TRACTION ENGINE WITH DANIEL BEST'S COMBINED HARVESTER.

De Lafayette Remington.

Mr. Remington is a scion of the Remington family so noted for its inventive genius, and he is closely connected with one of its prominent branches. He was born in Hancock county, Illinois, in 1847. In 1853, his father came to California with his family, settling in Placer county, where he and two of his sons died. In 1859, the remainder of the family emigrated to Oregon, where they still reside, at Woodburn. The subject of this sketch was brought up a farmer boy, but he early took to contriving and inventing, and "for over 20 years," to use his own expression, he has been "handling steam and steam machines." He has taken out a

number of patents, several of them pertaining to "reversing gear" and "automatic cut-offs." In 1888 he patented the excellent traction engine which bears his name as the patentee and which is the subject of the illustrated article presented on page 139, and which he claims is the first successful steam farm locomotive ever produced.

Mr. Remington is in the prime of life and is entirely devoted to the inventing and constructing of machinery, and with his mental endowments in these directions he may yet give us from his workshop up by the beautiful Willamette, the steam farm wagon, handy and economical for all purposes, that the world has been looking for these many years, and which, he feels sure, his "type" of engine, as now manufactured by himself at Woodburn and Daniel Best at San Leandro, California, approaches nearer than any other.

HORTICULTURE.

The Ultimate Orange.

In the *Florida Farmer* is a letter written by that veteran orange-grower, E. H. Hart, Federal Point, Florida, on the orange of the future:

It is perhaps to hybrids of the citrus family that we must look for the choicest oranges of the future. Every member has some superlative characteristic, and could all these be judiciously blended in one, the combination would form an ambrosial interminglingof flavors as yet "undreamed of in our philosophy." The pungent aroma of the lime, the exquisite fragrance of the lemon and bergamot, the cooling and refreshing juice of the mature grapefruit, the honeyed sweetness of the Sevilles, the sprightliness of the Malta strain, the satisfying richness of the Brazilian Navels, the spiciness of the Mandarin and the *je ne sais quoi* of the citron—would not the best traits of all united make a dish, like the four and twenty blackbirds, fit to set before a king?

This desirable consummation, at least in a progressive degree, will not require the labor of ages for its accomplishment. At Ocala, a stock-breeder looked over the broad expanse of glittering samples, and made the boast that he could breed up cattle much faster than we could evolve new oranges of startling merit. He did not consider that what he gained by slow gradations the more fortunate scientific fruit-grower sometimes achieves at a single bound—like a woman jumping at conclusions—and that happy accidents in the fruit line have a permanency unknown to flesh and blood.

Already the judicial board of the Florida Horticultural Society is beset by specimens of mixed races, of novel appearance, and of flavors that call for a second bite. The most sagacious of the conclave are often puzzled to determine the precise degree of admixture and decide which to class as mulattoes, quadroons or octoroons, when traces of widely opposite parentage are plainly apparent.

Dr. Bonavia, in his new work on Eastern oranges, thinks that the orange will not cross with the lemon. A Floridian who has never been in India may not venture to contradict him as regards the Orient, but like the French, we do things better here, and when a Floridian says oranges and lemons will not intermingle, we score him one for mendacity. Old growers have seen oranges, or what were oranges to all outward intent and purpose, growing on lemon trees and vice versa. Such varieties as Tardiff, Prata, White and Paper Rind St. Michael smack too strongly of the lemon to be, like Cæsar's wife, above suspicion; and the presence ofttimes, upon their outside, of lemon cells is plainly visible to the microscopist. The description and outline of a Navel lemon figured in the *Farmer and Fruit-Grower* of November 7th last is a tough morsel for unbelievers to swallow. There is an old saying that a molasses-barrel should be planted by every currant bush, and we know that many strawberries are sour enough to require a heavy draught upon the sugar-bowl before they "go right to the spot." Varieties containing a greater proportion of saccharine than usual are the most palatable, as the preferences of the birds demonstrate. If, in like manner, the juice of the lemon must always be diluted and qualified with sweet before we use it, it is not unreasonable to suppose that a slight dash of the superb dulcitude of a Washington Navel might render less sugar necessary in its use, without detracting from the acidulous potency.

Several hybrids of the Mandarin and common oranges have come up, good enough in flavor and keeping qualities to persuade the proprietors thereof that in them lies a mighty nice thing, which, if carefully guarded, will banish the letter I from flat purses. There was a suggestiveness about those Traveler oranges exhibited last winter at Ocala which caused a veteran taster to pause and observe, as he rolled a morsel over his tongue, that here was something which would be heard from again. Every specimen was broadly marked with the Navel—piquant, tender, with a smack of both grapefruit and Mandarin, and as distinct from aught else as the Mandarin from the common orange—a new departure, so to speak, which may be as eagerly sought in Northern markets some future time as was *citrus nobilis* in the palmy days of its first introduction. Another dainty little hybrid, evidently of the same descent, and never yet on exhibition, was indeed a surprise to me in marvelous piquancy and tenderness of pulp. Taking fruits like these as a basis and crossing and recrossing, who can tell what exquisite flavors may yet be attained?

If, trusting to the superlative quality of the oranges we already have, we are content to rest upon our laurels and rely upon the masterly inactivity of letting well enough alone, we may, in the phrase of degenerate vernacular, "get badly left." Does it not mean something to us when Dago Imperial Bloods sell for a solid V in Northern markets at the very time our brag oranges are, from abundance as well as immaturity, almost a drug? Does it not mean something when foreign fruit comes to us handsomely polished and showing traces of the brush, and set off by the shrewd Dago with glittering chromos and brilliant wrappers, the very ear-marks on the outside of the package giving testimony that the æsthetic tastes of classic ancestry have not yet died out in their descendants? The beautiful external appearance of California fruit, added to its handsome interior, goes far toward balancing the gustatory perfections, which we flatter ourselves are one of our peculiar institutions.

But our peculiar institution is not going to save us unless we gird up our loins and take hold. In orange-growing, as in all other mundane affairs, there is always room for improvement.

The Southern California Pomological Society.

H. W. Kruckeberg, corresponding secretary of this organization, has issued a circular from which we quote as follows:

The Southern California Pomological Society at its last meeting, held in Pomona, April 3, 1890, recognized that one of the leading obstacles in the way of rapid development of our rural industries was the lack of an organization that would represent all of our broad domain, and to obviate this evil concluded to make an appeal to every person engaged in producing anything from the soil to join the organization. The growers who have been "loyal and true" to the society feel that it has outgrown its distinctive local character and should now embrace a broader field and become the distinctive and representative body of the producing classes of Southern California.

The objects and benefits of such an organization are at once obvious and of wide application. There is much yet to learn, and by coming together and exchanging ideas and experiences, much good can be accomplished. The various subjects that the Pomological Society will deal with are all important, among them being: 1—Organization of local societies in every locality. 2—The building of large and substantial market-houses in every town, and regularly appointed market days by ordinance. 3—Formation of unions for selling, shipping and regulating prices. 4—Marketing, packing and shipping of green fruits. 5—Drying and curing fruits, and best methods to be employed. 6—Scales and washes. 7—Can infested trees be safely disinfected? 8—Fertilizers, values of different manures and commercial fertilizers. 9—Analysis of soils. 10—Quarantine against infested localities. 11—Efforts to secure proper legislation touching fruit pests, diseases and their extermination; besides a whole range of questions relating to planting, pruning, irrigation, cultivation, climate, soils, and a thousand other topics that enter into the successful practice of practical horticulture in Southern California.

Does not this array of important subjects appeal to your sympathies and your pocket-book? Is it not worth a small portion of your time to confer with your brother horticulturists, and by an interchange of opinions, experience and results, mutually benefit each other? Intelligent workers everywhere are in the field, each contributing his mite and knowledge to help develop the great industry of the country, and the greatest good you can do your fellow-horticulturists is to give them any suggestions and experiences you possess calculated to save labor, wear and tear, and thereby avoid mistakes. Do you not realize this fact from your own experience? And if so, why keep this knowledge to yourself when thousands are thirsting for it? The objects are certainly worthy of your hearty support, and the benefits to be derived are incalculable. Will you not join and be present at the meeting Thursday, October 2, 1890, at Rialto? Correspondence addressed to the secretary, D. Edson Smith, at Santa Ana will command immediate attention.

Cranberries in Washington.

A. F. Grow writes to the Washington *Farmer* of the cranberries native to the Pacific Coast, mentioning the fruit as found on the north end of Whidby island at the head of Dagualla bay: Our guide led us through a timbered swamp. Emerging from the swamp, we were soon walking over the soft moss forming the bed on which the cranberries had grown and ripened. We were soon picking as fine, plump berries as the writer ever saw growing in the cranberry marshes of the State of New York. We only picked over a small space on the southern border of the lake, but the berries seemed to extend over quite a large area.

The cranberry found in many parts of Western Washington is certainly very palatable. Those we picked on Whidby island were equal in quality and flavor to those we used to get in Illinois and Kansas, some of which were doubtless wild berries from Michigan and Wisconsin. Cranberry marshes were plenty in Western New York, but having on them tamarack and white cedar timber, and, unlike the marshes on Whidby, the berries were found where there was standing water, without the bed of thick moss. They were frequently picked where one had to be very careful to search out some root or hummock for the feet to stand on.

The moss on one cranberry marsh we visited on Whidby was from a foot to 16 inches thick and entirely dry. There was probably water on it in early spring.

Another difference between the Eastern cranberry and those on Whidby island is that there the soil was a rich, deep muck, while those seen by the writer here are utterly worthless for agricultural purposes. Cultivation would undoubtedly improve our wild cranberries. There are some cranberry farms near Olympia, and their cultivation wherever suitable land can be obtained ought to be made to pay well.

WEBSTER'S IDEA OF THE PACIFIC COAST.—It is somewhat singular that a man like Daniel Webster should have entertained such an erroneous idea of the value of the Pacific Coast as his own words show that he did. Less than 50 years ago a bill was brought before the United States Senate to establish a mail route from Western Missouri to the mouth of the Columbia river. Senator Webster opposed the measure as a useless expense and spoke as follows: "What do we want with the vast, worthless area—this region of savages and wild beasts, of deserts, of shifting sands and whirlwinds of dust, of cactus and prairie dogs? To what use could we ever hope to put these deserts, or these endless mountain chains, impenetrable and covered to their bases with eternal snow? What can we ever hope to do with the western coast—a coast 3000 miles long, rock-bound, cheerless and uninviting and not a harbor on it? What use have we for such a country? Mr. President, I will never vote a cent from the public treasury to place the Pacific Coast one inch nearer to Boston than it now is." After reading the above no one need be surprised that he made the great mistake, in his Webster-Ashburton treaty, of giving away our acknowledged claim to the Pacific Coast from the present northern limit of Washington to the southern boundary of Alaska, while all the country was crying out, "Fifty-four forty or fight!"

AUSTRALIAN BALLOT IN MONTANA.—The Supreme Court of Montana decided, July 29th, that the Australian ballot law was mandatory and not discretionary in its character. The case grew out of a suit for a justice's office, in which one of the candidates who received a majority of the votes, and who was given the office, had failed to notify the county clerk of his candidacy within the time fixed by law. The decision is regarded as one of great importance.

California's Stallions.

I beg to announce that, with a view of perpetuating the forms and characteristics of the leading stallions of California, I am issuing a series of lithographic likenesses. Each portrait issued will be an acknowledged likeness, the result of a close study of the horse and an artistic treatment of the subject. In order to secure for the series an immense advertising value, from a breeder's point of view, 4000 copies, at least, of each portrait will be issued.

Terms, $100 for first issue of 100 copies. In quantity, for advertising purposes, copies will be furnished at low rates.

H. BOYD, Artist.

268 Golden Gate Ave., San Francisco.

Wanted, Situation

As foreman of a large fruit ranch. Have had 25 years' practical experience in growing, packing and shipping fruit. Was with John Bidwell, Chico, Butte county, Cal., two years.

[COPY OF LETTER FROM GEN. BIDWELL.]

CHICO, CAL., July 14, 1890.

To whom this may concern. The bearer, Mr. J. Luther Bowers, having been in my service for some time, several years ago, as a practical fruit-grower, it gives me pleasure to say that I found him competent and reliable in all respects, and as such I very cheerfully commend him to the kind notice of all persons. Very respectfully,

JOHN BIDWELL.

Can also give good Eastern references. Address,
J. LUTHER BOWERS,
Herndon, Fairfax county, Virginia.

BUGGIES, Buckboards, Spring Wagons, Surreys and Road Carts. Write for our new catalogue. Baker & Hamilton, San Francisco and Sacramento.

BUGGIES AND BUCKBOARDS.—A complete assortment of vehicles in every grade and style. For circulars write Frank Brothers, San Francisco.

THE KRIEBEL ENGINE
And Plain Vertical Boiler.
Mounted on a Combined Base.
A very Cheap and Economical Engine.
Made of the very best material.
2 & 3 HORSE POWER.
Write for Prices.

That a fact PROVEN is evidence indisputable? We prove our claim that
WM. RADAM'S MICROBE KILLER
BEWARE OF IMITATIONS
Cures the sick BY CURING THEM, and furnish the proof in
OUR NEW BOOK.
Just issued, which will be SENT FREE to any address. The results are marvelous. Send for one.
RADAM'S MICROBE KILLER CO.,
1332 Marrket St., San Francisco, Cal.

THIRD ANNUAL AUCTION
— OF —
Holstein-Friesian Cattle
— AT —
Sacramento, September 13, 1890.
— BY ORDER OF —
FRANK H. BURKE of Menlo Park
We will sell without reserve Bulls, Cows and Heifers. Included in this sale will be all of the celebrated
PRIZE-WINNING ANIMALS,
And the winners of Sweepstakes and Gold Medals during the past year, about 30 head in all. These animals are
ALL THOROUGHBRED AND REGISTERED
And from the choicest families, including the Aaggies, Netherlands, Jacobs, Menlos and Twisks. It is the only offering ever made on this Coast of these extra fine butter and milk tribes.
For further particulars apply to
KILLIP & CO.,
22 Montgomery Street, San Francisco, Cal.

HORSE OWNERS!
TRY GOMBAULT'S
CAUSTIC BALSAM.

A Safe, Speedy and Positive Cure for Curb, Splint, Sweeny, Capped Hock, Strained Tendons, Founder, Wind Puffs, all Skin Diseases or Parasites, Thrush, Diphtheria, Pinkeye, all Lameness from Spavin, Ringbone or other Bony Tumors. Removes all Bunches or Blemishes from Horses and Cattle.
Supersedes all Cautery or Firing.
Impossible to Produce any Scar or Blemish.
Every bottle sold is warranted to give satisfaction. Price $1.50 per bottle. Sold by druggists, or sent by express, charges paid, with full directions for its use. Send for descriptive circulars. Address
LAWRENCE, WILLIAMS & CO., Cleveland, O.

HOME INSTITUTION
For the special treatment of Abdominal and Pelvic Diseases of women and men. Patients at a distance who cannot obtain the comforts and care so essential to success in connection with judicious and proper treatment may communicate with

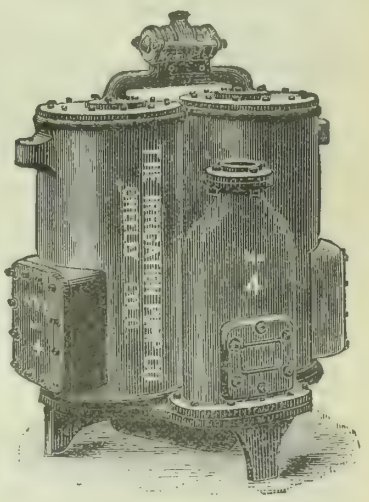
HOW TO DRAIN THAT WET LAND OR IRRIGATE THE ARID.



*

WE WILL SOLVE THE PROBLEM

— WITH A —

Huffer or Nye Steam Vacuum Pump.

These powerful Irrigating Pumps are operated by Steam Boilers and are without Pistons or any parts to wear out.

Will pump from 50 to 2000 gallons per minute. With live steam will raise 60,000 gallons of water 20 feet high with one bushel of coal.

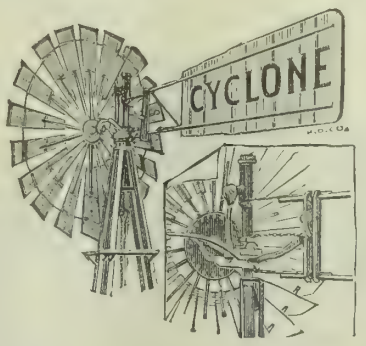
NO STEAM PRESSURE REQUIRED, except on a lift above that made by the atmosphere, which is about 30 feet at sea level.

Will pump dirty or gritty water equally well, or 40 to 60 per cent sand or gravel.

They can be bought and put in position ready for work cheaper than any other pumps of the same water-lifting capacity. There is no loss of atmospheric pressure produced by condensing the steam. No skilled labor required to run them. Any ranch man can operate them. They cost no more than water right and can be operated at a nominal expense.

Address PACIFIC MANUFACTURING COMPANY, 575 Mission Street, San Francisco, Cal., for particulars and illustrated circulars regarding these wonderful irrigating pumps.

CYCLONE WINDMILLS!



10 TO 30-FOOT WHEELS.

Cyclone Geared Wind Engines,

16 TO 30-FOOT WHEELS.

Star Mills, Hoosier Tubular Well Tools and Supplies.

Wells can be sunk from 50 to 100 feet per day. They will work rapidly and successfully in any kind of material, including rock, hard pan, cement gravel, quicksand, boulders, etc., etc.

SUPERIOR REDWOOD TANKS.

Windmill Pumps, Hand Pumps, Steam Piston Pumps, Rotary and Power Pumps, Deep Well Pumps.

Brass, Brass Lined and Iron Working Barrels. Brass, Brass Lined and Iron Double Packed Cylinders. Brass Goods, Gas Pipe, Fittings.

Philadelphia Lawn Mowers, Lawn Sprinklers, Movable Fountains.

Rubber Hose, Belting and Packing.

Our New Trade Catalogue will soon be out and ready for distribution.

ALMOND HULLERS FOR SALE

By A. O. RIX,

IRVINGTON, ALAMEDA COUNTY, CAL.

THE STATE

AGRICULTURAL COLLEGE.

Opens September 12, 1890.

Course of Study arranged expressly to meet the needs of the Farming and Mechanical interests of the State.

Large, Commodious and Well-Ventilated Buildings. The College is located in a cultivated and Christian community, and one of the healthiest in the State.

MILITARY TRAINING.

Expenses Need Not Exceed $150 for the Entire Session.

Two or more Free Scholarships from every county. Write for Catalogue to

B. L. ARNOLD, President, Corvallis, Oregon.

FOR SALE - Twenty-five choice Polled Angus Heifers, mostly in calf to imported bull "Minotaur." These heifers are seven eighths and pure blood Angus. Price $80 per head, delivered safe on car. Can also supply one or more choice registered Angus bulls. This is a splendid opportunity to start a herd of the finest breed of cattle in the world. Address, DR. G. M. DIXON, Propr. Argonaut Stock Farm, Sacramento, Cal.

BACK FILES of the PACIFIC RURAL PRESS (unbound) can be had for $2.50 per volume of six months. Per year two volumes) $4. Inserted in Dewey's patent binder, 50 cents additional per volume.

Agricultural Engineer

Clarifying Water from Streams and Ditches.

Editors Press:—In a recent number of the Press the difficulties encountered in securing pure water, and the methods employed by the leading water companies, was ably written up and illustrated. This same difficulty was met and overcome by the miners of '49, and their experience may help to solve the problem of how to obtain pure water. The miner used the water in the mountain section where storms were frequent and severe; in consequence the wash from the hillsides and gulches soon filled his reservoirs and ditches. As a rule he was compelled to use water that carried all the tailings from a mine farther up the stream, and this had to be disposed of before it could be turned into another ditch. The '49er proved himself equal to the emergency in this as in everything else. Dams built across the ravines impounded the wash coming down from above. Headgates placed at different levels allowed the drawing off of clear water from the reservoirs. Where the sand filled into the ditches badly a slot was cut across the flume and a 2x4 placed back of it. Through this slot the sand dropped, and thus left the ditch free from accumulating sands where the mud or slickens was held in solution. Slum-boxes were built at the side of the ditch. The water, by means of gates, was turned into these slum-boxes, and at the lower end of the box turned out by another gate into the ditch. These boxes were about three feet lower than the bed of the ditch, and so acted as settling tanks. When nearly full the upper gate, which turned the water into the slum-box, was taken out of the flume and placed across the entrance to the slum-box; then a gate at the lower side of the slum box was opened and the slum either shoveled out or a stream of water was turned in sufficient to wash it out. These slum-boxes could be built in succession and the water settled until it was as clear as desired.

When in Dakota, in '80, the superintendent of the Homestake mine used the water appropriated by another, and although he restored it to the same stream, was sued for damages for fouling the water. He put in a series of slum-boxes, and when the case came up for trial, placed on exhibition a bottle of water taken from the stream at the point where his ditch diverted the water, and another bottle of water from the stream below where he discharged it from his slum-boxes. The court found that the water had been purified instead of befouled, as it was cleaner after than before using.

Murphys, Cal. E. H. Schaeffle.

Fashion Notes.

Girls' Dress.

Fig. 1.—In this instance plain and embroidered nainsook and blue gingham are united in the dress, and embroidered edging prettily trims the neck and wrists. The full, round skirt is finished at the bottom with a deep hem and gathered at the top to fall in free, graceful folds from the waist, to which it is joined, a cording of the material being included in the joining. The ornamental front and back of the fanciful waist are arranged in box-plaits and mounted on plain high-necked portions, the box-plaits being ornamented with rows of tiny buttons.

A puff, which widens at the center of the front and back, droops prettily over the ornamental sections, and its upper edge is finished with a cording of the material. Above the puff the plain portions are exposed in round-yoke shape and faced with embroidered nainsook, and an upturned frill of embroidered edging at the neck. The sleeves are made over coat-shaped linings; the lower part of each sleeve is made of white nainsook and has the effect of a shirt sleeve, and a full puff of gingham forms the upper part, rising stylishly high above the shoulder. Wristbands of embroidered nainsook finish the sleeves, and a frill of embroidered edging droops prettily over each hand.

The mode is adaptable to all sorts of woolen and cotton textures, and cashmere, serge, fancy gingham, seersucker, cambric, embroidered flouncing, zephyr, China and India silks, pongee, batiste, challis, lawn, etc., will be especially favored for it. Embroidered edging, washable or other laces, novelty bands and fancy stitching may be added in any pretty way for garniture.

Misses' Dress.

Fig. 2.—The dress here shown developed in plain and figured India Silk and violet ribbon in three widths and embroidered edging provide the garniture. The full, round skirt falls in graceful folds from the fanciful bodice, to which it is joined; and the lower edge is hemmed and trimmed with three rows of velvet ribbon of different widths. The bodice has a plain front adjusted by single bust darts, over which a full portion, shirred at the top to form a frill, and a smoothly fitting portion are arranged to reveal the pointed yoke-facing of figured India silk. Rows of velvet ribbon arranged in points at their front ends trim the smooth front effectively. Full backs corresponding shoulders. The part below the puff is of figured silk, and an upturned row of embroidered edging forms a petty wrist-finish.

Combinations of fabrics or colors will develop attractively by the mode, which is well adapted to all seasonable goods of silken, woolen or cotton texture. Lace, embroidery or velvet will frequently be united with with the full front are arranged over plain, high necked backs that are fitted by side-back gores. The plaited ends of silk sash-ties are sewed over the side seams, and the ties are arranged in a pretty bow of long loops and ends at the back. The sleeves are in coat-sleeve shape, and each is rendered fanciful by a deep puff which extends nearly to the elbow and rises stylishly high over the

Fig. 1—CHILD'S DRESS.

Fig. 3—LADIES' LEGHORN HAT.

Surah, casemere, fancy gingham, etc., for the yoke and the plain portion of the sleeve, and a dainty arrangement of velvet or grosgrain ribbon will complete a most charming costume. Embroidered flouncing will make up very prettily in adress of this description.

The hat is of Neapolitan and is prettily trimmed with flowers and ribbon.

Ladies' Leghorn Hat.

Fig. 3.—For sea-side or carriage wear this hat is especially handsome. The brim is slightly rolled at the sides and bent up at the back. A large bunch of fine white flowers, purple velvet pansies and large leaves cover the crown and falls prettily over the brim. A *pouf* of Valenciennes lace is arranged at the back, and from it falls a long lace barb that is wound several times about the throat or pinned on the corsage. This hat may supplement an elaborate toilette.

Fig. 4—CHILD'S HAT.

Fig 2—MISSES' DRESS.

Child's Hat.

Fig. 4.—This picturesque hat is a black Leghorn flat and has a fancy-edged brim. The crown is encircled by a band of black velvet, and a wreath of yellow blossoms, leaves and grasses lies flatly on the brim. At the front is placed a large rosette of narrow velvet ribbon that falls partially on the brim and rests upon the crown. The brim may be bent up in the most becoming manner, if a flat brim be not desired; and tulle or *crepe* may be used for trimming.

For Information, our readers are referred to H. A. Deming, No. 124 Post street, S. F., a leading and well-established house, for paper patterns of plates illustrated in our present issue.

FLOUNCINGS

Just now we are offering some bargains in EMBROIDERED HALF FLOUNCINGS at 75c, $1 and $1.25 a yard. The patterns are exquisite, being much finer and deeper than the usual run of Half Flouncings at those prices. They will be found excellent for Children's Dresses. If you can use these goods, either now or hereafter, you will find it worth your while to order soon. We will send samples at each of the prices if desired.

TWO SPECIAL VALUES.

Our Illustrated Fall and Winter Catalogue will be out next month. Send us your name and a list of your friends and receive a FREE COPY.

HAND-PAINTED FANS

Real Handsome SATIN Fans can be had of us for only 50c. They are painted in exquisite designs on colored satin, and have gilt sticks chased in floral pattern. The usual retail price is half as much again. In ordering, allow 3c for postage.

Sheep and Wool.

Handling Shropshires.

As Shropshire sheep are gaining ground in this State, perhaps the following experience, as given at a recent meeting of Ohio stockmen by C. Hills, will be read with interest:

The care and general management of Shropshires, I suppose, should be much the same as are given to other breeds. For best results in obtaining strong lambs with a large percentage of doubles, the ewes should be in good, strong breeding condition at the period of coupling, and all that are not so should be drafted and fed lightly with oats, which will very soon bring them in heat, so that conception will usually take place by first intention, and flockmasters may look with reasonable confidence for their produce at the normal period of 21 weeks. About the first of October is the time ordinarily adopted for putting the ram with the ewes, which brings the lambs in March. This is a good time to have them come, so that they will be ready for grazing with the first starting of the grass. If not provided with good quarters for the lambing, the coupling had better be deferred for a month.

It is of great importance that the ram should be in vigorous condition at this time; by this I do not mean that he should be fat, for an overfed ram is generally a poor worker, but he should have been carefully fitted by judicious feeding of oats while yet at grass to bring him into the best estate. About 25 or 30 ewes are as many as one ram should be coupled with unless he be stood, and that involves so much trouble that I have abandoned the practice. The ram is turned in with the bunch of ewes selected for him in the evening and is taken out in the morning and kept in stable during the day, when he will be quiet and relish his food, which should be frequently varied and of the most nutritious sorts. In my practice the rams are taken off first of December.

Breeding ewes require a good deal of exercise during the two or three weeks preceding parturition, and should be kept out in pasture every day—unless the weather is very bad—which renders the lambing process one of comparative ease.

Close stables are not wholesome for sheep; they require a constant supply of fresh air and rarely suffer from the cold. In my practice better results have been had when the sheep have been kept in cheap sheds boarded upon two or three sides, allowing them to go in and out at pleasure except during heavy rains or sleety weather, which is the worst kind for them.

At the close of the grazing season our sheep are fed upon clover hay with an occasional change to corn-fodder, if we have it, until within two or three weeks of lambing, when they are fed lightly once a day with some oats and bran. After a week or ten days this feed is doubled—that is, fed morning and evening, and with one of these feeds a small addition of old-process oil-meal is given. A skillful flockmaster can readily tell by examination of their udders within two or three days of the time of dropping their lamb, when those most advanced should be given comfortable quarters for this interesting event. It is well to have a number of small inclosures in which one or two may be placed at night so as to avoid the confusion that frequently occurs when several ewes would lamb the same night. A few light hurdles placed at corners of the sheepfold answer a good purpose, and can readily be put up or removed as occasion requires. If the lamb is not up within ten or fifteen minutes after its birth helping itself at the maternal font, it should be carefully assisted to nurse; after which, unless it be a weak one of two or three from the same dam, very little further attention is required. When two or three days old they may be removed from the small pens and all the mothers and lambs allowed to run together. The lambs may be docked when two weeks old, castrated at three, and ear-marked at four, so as to insure proper identification. As soon as they begin to feed, troughs should be placed in adjacent pens separated by hurdles from their dams, admitting lambs only, when they should be fed a mixture of bran, oil-meal and oats. The ewes during the suckling period require liberal feed with the same, or until grass comes, with an occasional feed of sliced beets or mangels, which helps to keep up and sustain a liberal flow of milk, the most important element for growth in the lamb.

By this process they can be weaned at four months, and will continue to thrive rapidly if put into fresh pasture and out of hearing of the dams. The ewes should be put upon short pasture and their udders relieved every two or three days until dry, when they may be given better grazing, giving ample time for getting them into good condition for the next period of coupling.

Successful flock management requires careful and constant attention to several little things which might be thought trivial by some, but which are specially important, such as frequent changes of pasture, a constant supply of water and salt, frequent tarring of their noses in fly-time, and occasional trimming of their feet.

A daily examination of Shropshires while in pasture is necessary, as by reason of their broad, flat backs they sometimes get cast over and cannot recover themselves.

Shropshires do the best when shorn rather early. If troubled with ticks, the lambs will get the most of them in 10 or 12 days afterward, when they should be dipped in tobacco water or carbolic or arsenical preparations.

The methods mentioned for the care of sheep are those practiced mainly on my farm, and have proved reasonably satisfactory for a period of 10 or 15 years, since my adoption of the Shropshire breed. My purpose has been to keep the flock most nearly in accordance with their natural requirements, feeding them almost wholly upon the grasses and grains produced upon the farm, aiming to keep them constantly in good health and strong breeding condition without pampering.

The following brief list by telegraph for Aug. 12 will appear more complete on receipt of mail advices:

California—Ciser Bazus, S F., mat for fermenting vats; Jerome B. Harris, assignor of one-half to J. Gambetti, Stockton, traction machine; William P. Humphreys, assignor by mesne assignments to A. M Stinson, S. F., joint connection for suction pipes and protectors of dredgers; Charles A. Hussey, Fort Bidwell, cartridge shell reloader; John Isele, San Diego, spring motor; Angus E. McMillan, Oakland, miter box; Edward E. Park, S. F., rotary blotter.

Oregon — Charles Hill, Portland, clothes-hook; William A. Miller, Wapintia, cross-cut saw; Martin L. Pipes and E. F. Pernot, Corvallis, copy-holder for type-writing machines; Junius F. Whiting, Albany, means for reaper and mower knives.

Arizona—Dudley I. Craig, Silver King, adding machine.

Note.—Copies of U. S. and Foreign patents furnished by Dewey & Co., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Irrigation Dam in the Tuolumne.—At a joint meeting of the Modesto and Turlock irrigation directors, held on Saturday last, it was decided to build a joint dam 90 feet high in the Tuolumne river, 1800 feet above the Wheaton dam, for the use of both districts. Litigation with M. A. Wheaton was compromised by the payment of $35,000, the Turlock district paying $32 500 and the Modesto district $2500. The engineers of each district will submit plans for a masonry dam, the best to be accepted by the boards in joint session. The amount of water to be diverted by each district is upon the basis of the acreage of the districts. Each district will have equal privileges in the water rights which may be acquired in the future. The action of the boards is considered most important and advantageous.

Newspaper Agents Wanted.

Extra inducements will be offered for a few active canvassers who will give their whole attention (for a while at least) to soliciting subscriptions and advertisements for this journal and other first-class popular newspapers. Apply soon, or address this office, giving address, age, experience and reference. Special inducements to old agents.

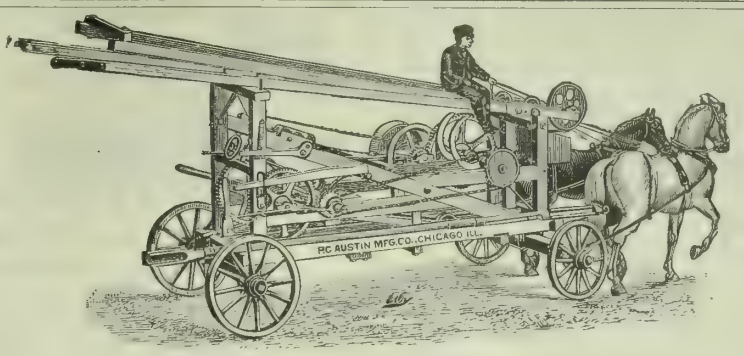
Dewey & Co., Publishers,
No. 220 Market St., S. F.

Let Us Know

If you fail to get this paper. We prefer to send missing Nos. Write soon and to the office direct. It is important that we should know when the paper miscarries.

Odd Numbers.

33 and 35 Main Street, San Francisco. Write to or call there on Frank Brothers, for Farm Implements of every description and Buggies, Carts or Spring Wagons.



Culture and Behavior.—The Oaks Home and Day School, situated at Madison and Eleventh streets, Oakland, is advertised in another column. Besides the regular course of studies, young ladies are trained in elegance of deportment and general etiquette.

Some weeks ago Mrs. McCormick of Pasadena ran a rose thorn into the thumb of her left hand. Inflammation set in so that the thumb had to be amputated.

Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, *or beyond the time he intends to pay for it*, let him not fail to write us *direct* to stop it. A postal card (costing one cent only) will suffice. We will not knowingly send the paper to any one who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent. Look carefully at the label on your paper.

Road Carts in great variety, also our $35 Phaeton Body Cart. Write for Circulars, Frank Brothers, San Francisco.

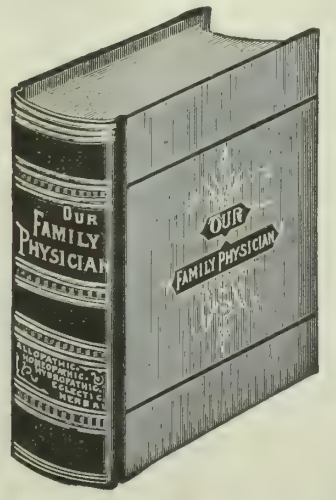
Well-Boring Machinery.

The illustration herewith represents the Austin portable rock-drilling machine on the road. This machine is made in two sizes of 500 and 750 capacity. It is the most complete, handy and successful rock-driller made. It is fitted with jetting attachment for earth when desired, and is especially adapted for boring for water, coal, oil or gas through any formation. This outfit is fully described in a large illustrated catalogue issued by the F. C. Austin Co., Carpenter St. and Carroll Ave., Chicago, Ill., who manufacture the largest variety, most complete and reliable line of well-boring machinery and tubular well supplies of any concern in the world.

Grand Opportunity for Subscribers!

READ WHAT FOLLOWS!

VALUABLE PREMIUM.



The article we are going to give away is no cheap or common-place affair. On the contrary, *it is the most valuable gift ever offered by a newspaper to each of its subscribers.*

It is something that every family ought to have, and which they will be glad to get and keep; namely, A Medical Book for Home Use, *the best work of the kind that has ever been printed!*

IT IS ENTITLED

OUR FAMILY PHYSICIAN.

SIX INCHES WIDE.

TWO INCHES THICK.

Sells in the bookstores for THREE DOLLARS. It is so popular that 50,000 copies have been sold in the last six months.

The book contains 480 pages, and in form is what is known as a royal octavo, that is (to give a better idea of its size), it is eight and one-half inches long, six inches wide, and two inches thick. It is printed on extra heavy paper and is handsomely bound in cloth, with embossed covers and gilt-lettered back.

Another Thing (and this is why we think the book worthy of our use in this way), it is different from all other works of the kind ever published, and the difference is such that it makes it more valuable than any or all of them!

This is shown by the following points in which it stands alone and without an equal:

FIRST—It teaches those who have it how to tell what the matter is when a person gets sick!

All similar books tell what to do if you know what the disease is. This book tells you how to detect the disease, and then what to do for it.

No other book published is up to this.

SECOND—When a person is really attacked by a *dangerous disease*, it enables you to know the fact, and in such cases its advice is: "Send for a competent physician at once." But in all ordinary cases, such as can be easily cured (and most of the ailments in a family are of this kind, if only you could recognize them) it gives full directions for treatment. The point is, that it teaches you to distinguish between a *dangerous* and a *trifling* disease, and tells you when it is necessary, and when *not* necessary, to call a physician.

No other book equals this.

THIRD—In its directions for treatment it is not confined to the practice used by any *one* class of physicians; but it gives, *separately*, and for each disease the methods used by each of the different "schools" of medicine; and in all cases the prescriptions are most eminent men in their respective modes of practice. This makes the work especially suited to the needs of every family, no matter what "school" of medicine they prefer.

No other book published does this.

Besides this, there are three chapters in the work which are worthy of special mention, namely, those on "Diseases of Women," "Diseases of Infants," and "Care of the Sick."

The first of these is a model of its kind. It is chaste in language, contains no disgusting pictures for children to happen on and be over curious about, and taken altogether is the most practical, sensible and straight-forward treatise upon this delicate subject that has ever been printed.

This chapter alone is worth many times the cost of the book to every mother, even if it had to be purchased at its regular price.

The other chapters referred to are equally well written and valuable.

OUR OFFER.

To all old subscribers who will renew their subscriptions for 15 months in advance at $3.00, *and get us one new subscriber at $3.00* [for 15 months], we will give a copy of the book. The new subscriber that the old subscriber gets will also receive a copy of the book.

To all delinquents who will pay arrearages and $3.00 for 15 months in advance, and get us one new subscriber at $3.00, we will give a copy of the book, with *fifteen months* subscription.

To present subscribers who are not in arrears we will give a copy of the book and 15 months subscription in advance for $3.50.

All subscribers who want the book sent by mail must send TWENTY CENTS EXTRA.

REMEMBER!

You will get a splendid paper—*worth more than double its price*—besides the remarkable premium offered.

The book has retailed at $3.00. SUBSCRIBE NOW. *You cannot afford to miss this chance*—it rarely occurs in a lifetime.

The lowest price we will sell the book without the paper is $2.00. Postage and mailing 25 cents extra.

—— WE OFFER ——

THIS GRAND OPPORTUNITY!

Because we anticipate subscriptions will be continued for years on the paper.

Important Auction Sale

— OF —

Standard and High-Bred Trotting Horses

— AND —

THOROUGHBRED HOLSTEIN CATTLE.

Property of J. H. WHITE, Esq., Lakeville, Sonoma County, Cal.

On Thursday and Friday, September 4th & 5th, 1890.

At RAILROAD STABLES, Cor. Turk and Steiner Sts., San Francisco.

On account of a contemplated change in business, we are authorized by Mr. White to dispose of all the high-bred stock upon his noted breeding farm at Lakeville, Sonoma County. This comprises over forty head of high-bred Trotting Stallions, Brood Mares, Colts and Fillies, most of them standard and all exceptionally fine individuals. They consist of the get of Stallions by Electioneer, Director, Antevolo and other noted horses. Most of the brood mares are with foal by Hernani, one of Electioneer's most prominent sons. Several have been bred to Director. Taken collectively they are, in size and form, the finest looking lot of trotters yet offered in California, and their breeding is upon the most approved speed lines.

The Cattle comprise over one hundred head of thoroughbred registered Holstein Cattle. The progenitors of this herd were selected of the choicest strains upon the famous breeding establishments East, and have been judiciously crossed with a view to develop to the fullest extent the milking strains. Mr. White has expended a large sum of money and great care in perfecting this band of cattle, and can justly claim it as one of the superior herds of the United States.

Catalogues are being prepared and will be sent on application only. Horses and cattle may be seen at ranch, six miles from Petaluma.

S. F. Market Report

Market Review.

DOMESTIC PRODUCE, ETC.

SAN FRANCISCO, Aug. 13, 1890.

General trade in farm products has been fairly active with steady prices ruling. The weather continues favorable for harvest work and fruit drying. The money market is reported fairly easy, with a free call for advances on stored grains. While the European wheat market has ruled barely steady, the Eastern markets have held strong at higher figures. The following is to-day's cablegram:

LIVERPOOL, Aug. 13.—Demand fair and prices a shade higher. California spot lots, 7s 3d to 7s 6d; cargoes off coast, 38s; just shipped, 37s 9d; nearly due, 38s; cargoes off coast, firmly held; on passage, quiet but firm; Mark Lane wheat, firm; English and French country markets, firm; wheat in Paris, steady; flour, quiet.

Foreign Grain Review.

LONDON, Aug. 11.—The *Mark Lane Express*, in its review of the British grain trade for the past week, says: English wheats were stronger at an average advance of 1s 7d. Foreign wheats were quiet. The news that the French crops will be 5 per cent under full average caused a slight rise. Oats were weak. Barley was firm. Corn dropped 3d. At to-day's market fine English wheat was very firm at 3d advance. Foreign wheats were steady. Flour was firm. American corn recovered 3d.

Liverpool Wheat Market.

The following are the closing prices paid for wheat options per ctl. for the past week:

	Aug.	Sept.	Oct.	Nov.	Dec.
Thursday	7s4½d	7s5½d	7s6d	7s6½d	7s6½d
Friday	7s3½d	7s4d	7s6d	7s5½d	7s5½d
Saturday	7s4d	7s4½d	7s5½d	7s5½d	7s6d
Monday	7s5½d	7s6d	7s8½d	7s7d	7s7d
Tuesday	7s6½d	7s6d	7s6½d	7s7½d	7s7½d

The following are the prices for California cargoes for off coast, nearly due and prompt shipments for the past week:

	O. C.	P. S.	N. D.	Market.
Thursday	38s0d	37s9d	38s0d	Slow.
Friday	38s0d	37s9d	38s0d	Firm.
Saturday	38s0d	37s9d	38s0d	Quiet.
Monday	38s0d	37s9d	37 9d	Steadier.
Tuesday	38s0d	37s9d	38s0d	Improving.

Eastern Grain Markets.

The following shows the closing prices of wheat in New York for the past week:

Day.	Aug.	Sept.	Oct.	Nov.	Dec.	Jan.
Thursday	98¾	99¾	99¾	100¾	101¼	...
Friday	97¾	98	98¾	99¾	100¼	...
Saturday	100¾	100¾	100¾	102⅛	100¼	...
Monday	102⅜	102⅜	103¼	104	104¼	...
Tuesday	103¼	104	104⅜	105¼	106⅛	...

The closing prices for wheat have been as follows at Chicago for the past week:

Day.	Aug.	Sept	Dec.	May.
Thursday	94¼	95⅜	98¼	102¼
Friday	93	94⅜	97⅝	101⅜
Saturday	95	96¼	101¼	104¼
Monday	98	99⅛	103½	107¼
Tuesday	99¼	100⅝	104½	108⅜

CHICAGO, Aug. 13.—Wheat—$1.00¼ for August, $1.01⅝ for September, $1.04¾ for December, and $1.08½ for May.

NEW YORK, Aug. 13.—Wheat—$1.06¼ for cash, $1.04⅞ for September, $1.05⅜ for October, $1.06¾ for December, and $1.10⅝ for May.

Crops

WASHINGTON, Aug. 9.—There has been considerable reduction in the condition of spring wheat, amounting to fully seven points. It is less in the Dakotas than in the other spring wheat districts. The average of the condition is 80 in Wisconsin, 80 in Minnesota, 87 in Iowa, 71 in Nebraska and 88 in the Dakotas. The latter is a decline of seven points, owing to hot southern winds. The oat crop is certain to be one of a very low yield and probably poor quality.

Another crop of great importance, potatoes, has also been much damaged by drouth, and a low rate of yield is assured.

ST. PAUL, Aug. 8.—On account of the hot weather and lack of rain during the last few weeks, the former estimates of 100,000,000 bushels as the wheat crop in the Dakotas will probably be a little out of the way. In South Dakota and Southern Minnesota the harvest is nearly over and the general yield will be fair. The railroads have weekly crop reports on which they base their estimates of the wheat yield, to know how much they are going to draw. If they are not mistaken, the yield will reach above 90,000,000 bushels.

KANSAS CITY, Aug. 8.—The total failure of the corn crop is reported in nearly all the territory in the northern part of the State from Junction City westward to the State line, and from Larned westward. Less than a third of the average yield is expected, or about 75,000,000 bushels.

OMAHA, Aug. 8. — Advices from nearly every county in the State show the condition of corn far below the average, several counties being entirely ruined by hot wind. In the extreme western counties where irrigation was tried the wheat has yielded heavily. In Iowa the indications are that corn will average about half a crop compared with last year.

INDIANAPOLIS, Aug. 8.—Reports to the State Agricultural Board indicate the wheat yield about 65 per cent of the average crop, and corn will mature half a crop. Fruit is a failure.

COLUMBUS (O.), Aug. 8.—According to the report of the State Board of Agriculture, the present indications show a decline of six points in the wheat prospect since the estimate of July 1st. The result of the threshing has been a disappointment to farmers in most sections of the State. The yield is not so great as anticipated from the appearance of the growing grain, and corn is badly injured. The indications are that only from 60 to 75 per cent of the average crop can be realized. Oats are badly injured by blight or rust, and apples, peaches and pears are almost a total failure.

Local Markets.

BAGS—The market for standard size grain-bags is very firm at 7¼c. The unusual heavy demand from Oregon and Washington is a prime factor in causing the advance. The increased demand from up north is due to heavy crops.

BARLEY—Notwithstanding the free receipts, the market has held strong. In futures, the dealing on Call has been quite free. The following are to-day's reported sales:

Morning Session: Buyer 1890—100 tons, $1.30½; 100, $1.30. Seller 1890, new—100 tons, $1.24½; 100, $1.24¼ ₩ ctl. Afternoon Session: Buyer 1890—100 tons, $1.30¼; 100, $1.30½; 600, $1.30; 200, $1.29¾; 100, $1.29⅞. Buyer season—100 tons, $1.36½; 100, $1.36 ₩ ctl.

BARLEY.

	Buyer Season.		Seller 1890.		Buyer 1890.	
	H.	L.	H.	L.	H.	L.
Thursday	133½	132	121½	121½	128½	127½
Friday	132	132			127	126½
Saturday	132½	132½			127	126½
Monday	134½	134½	122½	122½	128½	127½
Tuesday	135½	135½	1.4	123½	129½	129½

BUTTER—Increasing receipts of Eastern and dealers buying pickled butter, caused the market to shade off, with an easy tone at the close.

CHEESE—The market shows an easier tone, under a lessened demand and stocks accumulating.

EGGS—The market has held strong throughout the week, with a good demand ruling. The cold storage supplies are going out.

FLOUR—The market is steady, with a fair demand ruling.

WHEAT—The sample market has ruled strong throughout the week, in sympathy with the Eastern and foreign markets. Buyers continue their usual bear tactics so as to beat the market down, but without success. In futures, trading has been fair at slight fluctuations. The following are to-day's Call Board sales:

Morning Session: Buyer 1890—100 tons, $1.45⅝; 100, $1.45⅜; 1100, $1.45¾. Buyer season—400 tons, $1.54⅝; 300, $1.54½; 1100, $1.54¾ ₩ ctl. Afternoon Session: Buyer 1890—600 tons, $1.44½; 400, $1.44⅝; 500, $1.44¾. Buyer season—500 tons, $1.53½; 1800, $1.53⅜. Seller 1890, new, season's storage paid—100 tons, $1.40⅝; seller 1890, new, season's storage paid after September 1st—400 tons, $1.40½; 1000, $1.40¼ ₩ ctl.

WHEAT.

Bran, sks	4,900	Popcorn sks	....
Buckwheat, sks	....		

*Overland 350 ctls. †Overland 221 ctls.

Cereals.

The local wheat market has held strong throughout the week. The supply of available disengaged tonnage in port is light, which is against shippers; but as the supply to arrive is large, buyers will store their grain until the vessels begin to put in an appearance, which should be soon. Large farmers are reported to be letting go of their wheat slowly, but the smaller farmers are said to be meeting the market quite freely, being satisfied with present prices rather than incurring expenses and paying interest for a prospective rise in prices. The markets abroad and at the East have been and are still governed to a large extent by the weather. Present advices report unfavorable weather, which is causing better markets to obtain.

Harvest advices in this State are confirmatory of a large outturn in the southern part of the State, and also in localities in the central counties. Taking the State as a whole, the shortage will be fully as great as that heretofore published in the RURAL PRESS. The Oregon and Washington crop is the best known for years.

The barley crop in this State is light, which is in favor of holders. The crop in the Central States is short and not of the best grades, which should still further improve the prospects for this coast.

Corn is strongly held. The crop does not promise to be as large as heretofore claimed. In the Central States the crop, it is now confidently stated, will be short.

Oats are firm at steady figures. In this State the crop is reported to be short. From Oregon, advices are rather conflicting; while our advices report a full average crop, others claim that there will be a shortage.

Rye is quiet but firm. The crop in this State is short.

A leading New York paper, Aug. 2d, says: The talk this morning was that every day of such burning hot weather as is being experienced at the West meant a reduction of 50,000,000 bushels in the corn crop. The estimates of the crop are being rapidly reduced, and the bulls claim that the Government report will show a reduction to 67 or 70. The conservative element is now talking 80, and perhaps 75. A condition of 75 would indicate a crop of 1,700,000,000 bushels, and a condition of 70, a crop of about 1,600,000,000 bushels. Such a crop, with a shortage in oats of 100,000,000 bushels, in wheat of 60,000,000 bushels, and a poor potato crop, would be a serious calamity. When the crop of corn is 2,100,000,000, a reduction of 100,000,000 or 200,000,000 is not so serious, but a reduction of 500,000,000 to 600,000,000 is very serious. Unless rain comes, and comes soon, the worst hopes of the bulls will be realized.

Feedstuff.

In ground feed another advance in prices has been made. The demand is fairly active, while the supply is not so liberal. The consumption appears to be increasing.

Notwithstanding the heavy receipts, hay has strengthened under freer consumption and a fairly good shipping demand. It is very generally claimed that there are from 10 to 20 per cent more animals being fed than there was at this time in 1889. The main increase comes from a larger fruit crop and more railroad building and other outdoor improvements going on, which require more work horses.

Fruits.

Berries are meeting with fair sale. As the receipts are not large, the market holds fairly strong, with raspberries slightly higher.

For tree fruits the market set off for peaches, pears and apricots. The decline is due to canners having free deliveries on old contracts, and consequently their not being able to handle that coming in on consignment. The bulk of the pears and peaches are overripe for keeping, which compels forced sales. We noticed in our rounds this morning several consignments that will not keep 24 hours without assorting. It is these kinds of consignments that forces the market down. White plums are taken by canners, which keep them steady. Other kinds of plums are slow. Apples are coming in quite free, but as there is a good demand for the better kinds, the market keeps steady. Crabapples are slow.

Grapes, under free receipts, have been sinking, but to-day sales were made slightly higher, owing to a good shipping demand, which, when met, will stop for a short time. Some Zinfandel wine grapes were placed the past week at from $15 to $16 a ton.

In dried fruits we notice that apricots are more sluggish. This is owing to Eastern dealers having their first wants met. Peaches are quite hard to quote, owing to the high asking prices. Nectarines are coming to the front under favorable circumstances. Apples and pears are steady. Prunes are in demand at high prices. As near as we can learn, the following covers the range of prices for this season's dried fruits: Apples, evaporated, 11c; sliced, 8@9c; quartered, 7¾@7¾; plums, pitted, 8@10½c; peaches, unpeeled, bleached, 18@22c; peeled, 28@30c; apricots, sacked, bleached, 14@17c; boxed, slightly higher; white nectarines, 14@16½c; red, 12@13½c; prunes, ungraded, 10@10½c; grapes, 3@4c.

Raisins for September and October delivery continue to be inquired for. Layers range from $1.80@2.25, according to brands, and loose Muscatels, $1.65@2.

Live-stock.

The market for bullocks and mutton sheep is against sellers, as it is against large hogs, but small-sized hogs suitable for the block are wanted, chiefly for the Chinese trade. As outdoor work draws to a close, medium-size work horses are slow of sale. Large draft horses are wanted, as are general utility horses and matched teams.

The market for dressed cattle is quoted as follows [to obtain the price on foot, take off from the price for stall-fed one-third to one-half, according to the nature of the feed and time fed; and for grass-fed take off the price from 40 to 60 per cent]:

HOGS—On foot, light grain fed, 4¾@4¾c ₩ lb; dressed, 7¼@8½c ₩ lb.; heavy, 3¾@4¾c ₩ lb.; dressed, 5¾@6¼c ₩ lb. Stock hogs, 4¼@4¾c ₩ lb

BEEF—Stall fed, 6½@—c ₩ lb.; grass fed, extra, 6@—c ₩ lb.; first quality, 5¾@—c ₩ lb.; second quality 5@5¾c ₩ lb.; third quality, 4½c@— ₩ lb.; bulls and thin cows, 2@3c ₩ lb.

VEAL—Small, 6@8c ₩ lb.; large, 4@6c.

MUTTON—Wethers, 6½@7c ₩ lb.; ewes, 6@6½c ₩ lb.; lamb, spring, 7@8c.

Vegetables.

Garden truck does not show any material change, receipts and demand being about equal.

Onions are weak at lower prices under free receipts and only a fair demand. Red onions are hard to sell. Small-sized onions for picklers have a fair sale.

The receipts of potatoes are free, being in excess of the demand, owing to many points being supplied by local farmers. The quality continues exceptionally good.

Beans are higher and strong at the advance. The crop is not as large as heretofore claimed, while the weather in the Central States is against growing crops.

Miscellaneous.

From the *Commercial News* of Aug. 13th the following summary of tonnage movement is compiled:

	1890.	1889.
On the way to this port	273,011	236,549
On the way to neighboring ports	20,014	24,6 2
In port, disengaged	6 596	14,919
In port, engaged for wheat	41,976	56,025
Totals	341,597	332,095

To get the carrying capacity, add 65 per cent to the registered tons as given above.

From July 1, 1890, to Aug. 6, 1890, the following are the exports from this port: 1890. 1889.

Wheat, ctls	974 481	1,162,753
Flour, bbls	118,842	143,351
Barley	27,996	67,074

Poultry is without any particular change to note, the demand and supply being about evenly balanced. Honey shows a fairly firm tone for 1-lb frames and choice white extracted, but other grades are slow. The following are the quotations: Choice white comb, quotable at 8@9c; do, in 1-lb frames, 10@11c; ordinary comb, 7@7½c; white extracted, 5½c; amber, 4½@5c ₩ lb.

For new crop nuts there is a good inquiry, with sales of almonds at 13@13½c, and walnuts at 9@10½c.

Hams, bacon and hides are strong at a slight advance. The poorer corn crop prospects in the Central States is in favor of better prices for hog product.

Hops are firmly held, with another advance obtainable for future delivery.

In wool more business is reported, but at unchanged quotations.

Exports by sea the past week aggregate as follows: Beans lbs, China, 7401. Barley ctls, Japan, 2947; Honolulu, 3962. Flour bbls, China, 11,645; Japan, 954; Manilla, 1000. Apples, boxes, China, 322; Japan, 75.

Domestic Produce.

Extra choice in good packages fetch an advance on top quotations, while very poor grades sell less than the lower quotations.

SHEEP AND DOGS.—The census will not only tell us how many sheep were killed by dogs within the past year, but will tell us how many dogs it took to do it. Leaving out the dogs harbored in cities, it will without doubt be shown that there are more dogs than sheep on the farms of the United States. Sheep pay; dogs don't. It was a rule of Ricardo that to be successful in business, we must "cut off losses and let profits run on."

EXPLANATION. Cl. for clear; Cy, cloudy; Fr., fair; Cm., calm; — indicates too small to measure. Temperature, wind and weather at 5 P. M. (Pacific Standard time) with amount of rainfall in the preceding 24 hours. 'T' indicates trace of rainfall.

California Fruits East.

CHICAGO, Aug. 9.—The Porter Brothers Co. sold to-day seven cars of California fruit. Nectarines, red, $1.75@2; Early Crawford peaches, $1.25@1.85; Orange Clings, $1.95; Susquehanna peaches, $2.05; Foster peaches, $1.70; Columbia plums, $1.45; Fallenbergs, $1.70@1.75; yellow egg plums, $1.65; French prunes, $2.30@2.40; Bartlett pears, $3.25@4.05.

NEW YORK, Aug. 9.—Among buyers who have an assured outlet a keen interest prevails in large prunes. Other buyers are disposed to await the bringing to the market of French supplies. Though there is a glowing prospect for Pacific fruit, too much must not be expected for stock off from good to fine. Close economy will be exercised in the East in everything that can be preserved for the cheapest wants and "pie timber." A remnant of old dried unpeeled peaches brought 20c. New are quoted at 23c spot. There is some inquiry for raisins, but no material snap demand. Buyers rather falter at the excited condition of dried apricots, but, as nothing can completely take their place, court prices are likely to follow. Late spot rate 19@22. Canned fruits are buoyant. Salmon has practically favored sellers, while the demand is good.

CHICAGO, Aug. 11.—The Montgomery Auction Co. sold to-day seven carloads of California fruit for account of W. R. Strong Co., Gregory Bros. and the Earl Fruit Co. at the following prices: Peaches, Foster, $1.40@1.45; Early Crawford, $1.35@1.60; Orange Cling, $1.25@1.55; Lemon Cling, $1.25; Susquehanna, $1.55@1.60; pears, Bartlett, $3.50@4.15; Howell, $3.35; grapes, Rose de Peru, half crates, $1.40; Muscats, $1.95@2.15; Tokay, $3@3.40; Blue Malvoisie, $1.40; Fontainebleau, $1.40; Chasselas, $1.40; plums, Egg, $1.60; Columbia, $1.55@1.65; Fallenbergs, $1.40@1.50; Purple Egg, $1.50; Golden Drop, $1.20; Washington, $1.25; Gros prunes, $1.60@1.80; nectarines, $1.25.

NEW YORK, Aug. 10.—Much fear is entertained by dealers in California fresh fruit that the present strike will play havoc with the business which is now in a flourishing condition. The press has constant accounts of California fruit sales and the merits of the fruit. Never before has there been such interest taken on the subject. This is to be expected, as New York is dependent for fruit almost entirely this year upon California. Pacific Coast hops sell at 18@21c; hides, selected, 21@25 lbs., 14½c; raisins, two crown, $1.90; three crown, $2.20; layers, $2.10 to $2.45; prunes were quoted at 12c, but none are for sale; California walnuts, 7½c. The wool market is slow; but during the week the sale of 17,000 lbs. spring was made; scoured California sold at 15½c; another sale of 11,500 lbs., on private terms, was said to be at 19c.

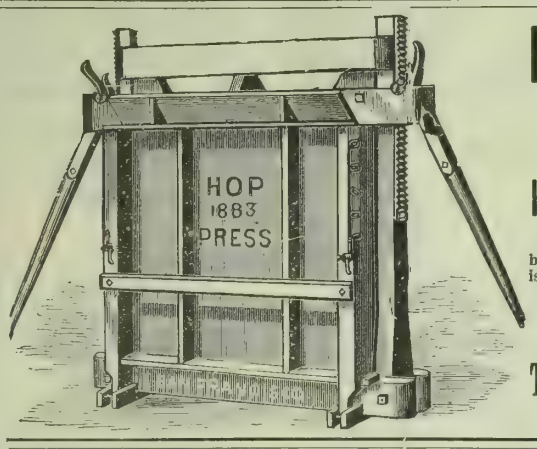
CHICAGO, Aug. 12.—Porter Bros. sold California fruit to-day as follows: Bartlett pears, $3.50@4.25 except one car in poor order sold at $2.35@2.90; peaches, Early Crawford, $1.45@2.20; Beurre Hardy pears, $2.50; nectarines, $2.05@2.10; Susquehanna, $1.85@2.05; Rose de Peru grapes, $2.50; Muscat, $1.70@3.60; Fontainebleau, $1.35@1.65; Black Hamburg, $2.10; Tokay, $1.80@2.35; Hungarian prunes, $1.80@1.85; Gros prunes, $1.90.

CHICAGO, Aug. 12.—The Montgomery Auction Co. sold to-day seven carloads of California fruit for account of W. R. Strong Co., the Earl Fruit Co and others at the following prices: Pears, Bartlett, $3.15@4.05; Howell, $3.45; peaches, Early Crawford, $1.75@2; Orange Cling, $1.35; plums, Washington, $1.25; Bradshaw, $1.20; Fallenbergs, $1.40; Egg, $1.30@1.50; Columbia, $1.30@1.40; Bulgarian, $1.15; German prunes, $1.40@1.50; Gros, $1.75@2.20; French, $1.10@1.15.

NEW YORK, Aug. 11.—Sgobel & Day sold two cars of California fruit to-day as follows: Early Crawford peaches, $2.20@2.85; Gros prunes, $2.10; Bradshaw plums, $1.95; Washington, $1.50@1.80; Purple Duane, $1.75; Golden Drop, $1.75@1.80; Bartlett pears, $4.90@5.25; all in prime condition.

The following has been received from the above firm, agents of the California Fruit Union: Buyers are hungry for fruit in good condition. The market is very strong, especially on Bartlett pears and Crawford peaches. Agents announce daily sales in refrigerator cars.

NEW YORK, Aug. 12.—It is reported that 4000 boxes of French prunes, the first of the season, have been sold at 32½ francs. The *Commercial Bulletin*, which has this news, says that this was a speculative sale upon the part of a Bordeaux firm, as there are numerous buyers prepared to pay considerable advance on this price, but are unable to secure attention to their bids. The fact is, there is a general disinclination to make firm offers for goods for shipment at any price.



MINNEAPOLIS, Aug. 12.—The first auction of California fruit here occurred to-day. Twenty-five buyers were present from Minneapolis and St. Paul. The bidding was lively. One carload was disposed of in half an hour. Pears brought $3.80; prunes, $1.30; and peaches, $1.85. There was a rush for 100 crates of Muscat grapes at $3.10.

CHICAGO, August 13.—California green fruits continue quite active, with prices ranging as follows: Nectarines—boxes, 20 lbs., 75c@$1.25. Peaches—Crawfords, boxes, 20 lbs., $1.25@2; Orange Clings, $1.50@2. Pears—Bartlett, green, $4@4.25; Bartlett, ripe, $2@3; Howell, $2.25@3.50; Duchess, $2.25@2.50. Gros prunes—20-lb. boxes, $2@2.25; Plums—Purple Duane, 20-lb. boxes, $1.25@1.75; Washington $1.25@1.50; Egg plums, $1.25@1.50; Columbia, $1.50@1.75; German prunes, 20-lb. boxes, $1.50@2.25; grapes, Fontainebleau, one-half cases, 4 baskets $1.50@1.75; Muscat, $1.75@2; Tokay, $1.75@2; Rose of Peru, $1.25@1.50. California dried fruits remain at last quotations. At present the market is a little more quiet. Of apricots there are moderate offerings. Less demand from local jobbers exists, but there is a moderate outside order trade. Holders remain firm. The market is quotable at 17½@18½c. A few unpeeled peaches, very choice, have been received. They are firmly held at 24@24½c ₱ lb. No sales reported.

CHICAGO, August 13.—Porter Brothers sold eight carloads of California fruit to-day as follows: Bartlett pears, $3.25@4.40, with the exception of two cars of ripe stock at $2.15@2.60; Early Crawford peaches, $1.40@1.95; Susquehanna, $1.85@2.10; Foster, $1.55@1.70; Orange Cling, $1.60@1.80; Columbia plums, $1.40@1.65; Fallenberg, $1.40@1.60; Gros prunes, $1.40@2.15; Silver, $1.45@1.60; Muscat grapes, ₱ crate, $1.60@2.

CHICAGO, August 13.—The Montgomery Auction Co. sold to-day six carloads of California fruits for account of W. R. Strong Co., the Earl Fruit Co. and others at the following prices: Bartlett pears, $2.75@3.40; Beurre Hardy, $1.90; Early Crawford peaches, $1.50@1.75; Orange Cling, $1.45@1.85; Hale's Early, $2.10; Albright, $1.60@2.05; Silver prunes, $1.50@1.55; Columbia plums, $1.40@1.50; Egg, $1.40; Fallenberg, $1.40; Muscat grapes, ₱ crate, $1.60; Black Hamburg, $1.50; Purple Damascus, $1.30; Nectarines, $1.60@1.70.

NEW YORK, August 13.—Sgobel & Day, agents of the California Fruit Union, write that peaches are very strong here at $3@3.50 ₱ box, and prospects are very favorable.

VALUABLE PATENTS FOR SALE

I offer for sale my patents of my

CALIFORNIA STUMP PULLER

For all territory in the United States east of the Rocky mountains and also my patents in Canada for the same invention; and I will sell a half interest for the Pacific Coast to any establishment in or near San Francisco having facilities for the manufacture of the machine.

This machine is adapted to pulling light grubs, large stumps or standing timber, and can be successfully operated on any hillside that is not too steep for cultivation. The machine, operated by one horse, will pull a green oak stump, four feet in circumference, inside of two minutes, and will pull a dead redwood stump, 20 feet in circumference, inside of half an hour.

The power of the machine is practically unlimited, and five acres or more, if desired, of land can be cleared without changing its position. These are no idle claims, but facts which I will prove to the entire satisfaction of any person who means business and will investigate the matter.

There are yet millions of acres of land, both in the United States and Canada, in a wilderness state, and the bright fruit prospects are stimulating land clearing throughout the Pacific Coast, and as this machine, in the present state of perfection to which I have brought it, is without a competitor, it is a matter to which manufacturers should give their attention. Principals only need apply. For further particulars, address,

GEO. HARVEY,

FORESTVILLE, SONOMA COUNTY, CAL.

ORANGE CULTURE IN CALIFORNIA.

Now that the interest in the culture of the orange is extending so as to embrace nearly all parts of the State, a book giving the results of experience in parts of the State where the growth of the fruit has been longest pursued will be found of wide usefulness.

"Orange Culture in California" was written by Thos A. Garey of Los Angeles, after many years of practical experience and observation in the growth of the fruit. It is a well-printed hand-book of 227 pages, and treats of nursery practice, planting of orange orchards, cultivation and irrigation, pruning, estimates of cost of plantations, best varieties, etc.

The book is sent post-paid at the reduced price of 75 cents per copy, in cloth binding. Address DEWEY & Co., Publishers "Pacific Rural Press," 220 Market St., S. F.

Books for Pleasure and Profit.

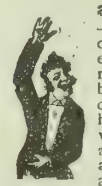
Cushing's Manual.—Revised Edition, with Additions and Corrections.

No one who wishes to take part in the proceedings of any organized body can afford to do without the help of this little volume; knowledge of its contents alone is a valuable education, and the price is so moderate that no one need deprive himself of its teachings. Also containing the Constitution of the United States and Declaration of Independence. Containing 200 pages.

Cloth gilt. Price..... 50 cts.

Wilford's Original Dialogues and Speeches for Young Folks.

—Being by far the most complete of its kind ever issued. This work supplies that palpable need, which has so long been evident in books of this class, that of *Dialogues* and *Speeches* adapted to the natures of children. This work contains **19 Original Dialogues** and 53 Speeches, especially adapted for children between the ages of 5 and 12 years. 160 pages.



Paper cover, Price.....25 cts.

Brudder Gardner's Stump Speeches and Comic Lectures.

—Containing the best hits of the leading Negro delineators of the present day, comprising the most amusing and side-splitting contribution of oratorical effusions which have ever been produced to the public. The newest and best book of Negro comicalities published. 160 pages. Bound in illuminated paper covers. Price.....25 cts.

Burdett's New Comic Recitations and Humorous Readings.

—A new volume of comic and humorous selections, compiled by the celebrated humorist, James S. Burdett many of which have never before been published in book form. In addition to the new and original pieces here contained, this book has the advantage of *bringing together into one volume* all of the very best selections of a comic nature which have hitherto attained a wide popularity through the public representations of the most renowned humorists of the day. It is the newest, handsomest and choicest book of its kind. Price.....25 cts.

The Candy Maker.

—A Practical Guide to the Manufacture of the various kinds of Plain and Fancy Candy. The fullest directions are given for getting up the most exquisitely beautiful looking candies, as well as the most alluring to the palate; while equal attention is given to all the plainer kinds, so universally liked by the "little ones." Every Direction, every Recipe, every Concoction of which Sugar, Spice and Essence are the ingredients, is given in such a plain way that a child can understand them. Large 12mo. Price.....50 cts.

Wilson's Ball-Room Guide and Call-Book.

—The most complete published, containing full and requisite information for the giving of Receptions, Parties, Balls, etc., with clear directions for calling out the figures of every dance, together with thirty-eight pages of the latest and most fashionable copyright music, and containing nearly one hundred figures for the "German." Bound in illuminated board cover, with

Bound in illuminated paper cover, Price.....50 cts.

Dunbar's Complete Hand-Book of Etiquette.

—This work presents, in a clear and intelligible manner, the whole art and philosophy of Etiquette. Among the contents are: Bodily Deportment, Speak Grammatically, Self-respect, Pedantry, Social Characters, Traveling, Useful Hints on Conversation, Forms of Invitation, Letters of Introduction, Bridal Etiquette, Ball-room Etiquette, etc., etc. Bound in Boards, cloth back.

Price.....50 cts.

Carpenter's Manual.

—Instructs in the use of tools and the various operations of the trade, including drawing for carpenters, forms of contracts, specifications, etc., with plain instructions for beginners, and full glossary of terms used in the trade. Also gives plans and specifications for building a number of frame houses. Illustrated.

Price.....50 cts.

Jenny June's Practical Cook Book.

—An established favorite in thousands of families. The recipes in it are all the result of practical experience, and there is beside a useful chapter of recipes for dishes of Hebrew families. Containing 1,200 choice and carefully tested receipts, embracing all the popular dishes and the best results of modern science reduced to a simple and practical form. Cloth, $1.00. Illustrated.

¿ Habla V. Espanol ?

Spanish at a Glance.

A new system arranged for self-tuition, being the easiest method of acquiring a thorough knowledge of the Spanish language ever published.

Bound in paper cover, Price.....25 cts.

A portion of the above works will be sent from our office direct, while some will be ordered from other publishing houses, requiring some two weeks longer time.

To Subscribers and Readers.

A Handy Paper Binder—A. T. Dewey's patent elastic binder, for periodicals, music and other printed sheets, is the handiest, and very cheapest of all economical and practical file binders. Newspapers are quickly placed in it (as received) and held neatly, as in a cloth-bound book. It is durable, and so simple a child can use it. Price (size of this paper, Harper's Weekly, and Scientific American), 75 cents; postage 10 cents. Postpaid to purchasers of this paper, 50 cents. For sale at this office. Send for illustrated circular. Agents wanted.

Complimentary Samples.

Persons receiving this paper marked are requested to examine its contents, terms of subscription, and give it their own patronage, and as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription, paid in advance, 5 mos, $1; 10 mos., $2; 15 mos., $3. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber, please show the paper to others.

Injurious Insects of the Orchard, Vineyard Field, Garden, Conservatory, etc.,

—WITH—

Remedies for their Extermination.

By MATTHEW COOKE.

Late Chief Executive Horticultural Officer of California. Illustrated with over 750 wood-cuts and 25 pages of classified illustrations. This book is designed for the use of orchardists, vineyardists, farmers and others interested in the subjects treated. It is designed to convey practical information concerning some of the species of insects injurious to the industries of cultivators of the soil, and those interested in earth produce generally. Price $4, postpaid. For sale by Dewey & Co., publishers, 220 Market St., San Francisco.

A Fire Damp Indicator.—A small instrument has been devised for use in mines to indicate the presence of fire-damp, or in gas mains to indicate the presence of gas. The invention is based upon the property certain metals have of evolving heat in the presence of hydrogen gas.

For Sale.—Valuable land in Tulare county artesian belt. 160 acres, 1½ miles southwest of Tulare city; 480 acres, 7 miles southwest of Tulare, with large flowing artesian well, well-finished two-story house, large barn, etc.; 160 acres, 2 miles southwest of the above; 480 acres 3 miles southwest of Pixley and about 4 from Alila. For sale by owner in lots to suit at low prices, low interest and very easy terms. For further information, address LAND OWNER, Box 2517, S. F., or A. T. DEWEY, No. 220 Market street, San Francisco, Cal.

Ranch Wanted.

Small general farm, partly improved; not less than 40 acres and costing not over $2000; within few miles of rail or water transportation. Address "Ranch," care Pacific Rural Press.

To Get Rid of Ants.—A correspondent of the *Scientific American* says: Buy one-half pound or more corrosive sublimate, powder it very fine and strew the same sparingly on the ground, also in the crevices, nests and trails of the ants, and I guarantee they will leave your premises as quick as they have come. Corrosive sublimate is a deadly poison and should be handled with care.

$500,000

To loan in any amount at the very lowest market rate of interest on approved security in Farming Lands. A. SCHULLER, Room 8, 420 California St., San Francisco. **

$3,250,000

THE PELTON WATER MOTOR

Affords the cheapest and most convenient power for Ranch, Vineyard or Dairy purposes, as well as for running dynamos for electric lights, pumps and every other variety of machinery.

It possesses in the same degree the wonderful energy and power that has made the Pelton Wheel famous in all parts of the world.

These motors are made of varying sizes, with capacities ranging from the fraction of one up to 15 and 20 H. P., enclosed in iron cases, all ready for pipe connections, and are warranted to develop a given amount of power with one-half the water required by any other wheel.

The cost, considering capacity and efficiency, is fully 50 per cent less.

Circular, giving full information, sent on application.

Parties writing for information should give full particulars as to power wanted, source of water, supply, with head or pressure. Address

1890—THE STATE FAIR—1890

OF 1890 AT

SACRAMENTO,

SEPTEMBER 8th TO 20th INCLUSIVE.

CALIFORNIA'S ANNUAL EVENT!

Showing Progress Made in Agricultural, Mechanical and Industrial Arts.

LIBERATI'S FAMOUS MILITARY BAND OF FIFTY SELECTED ARTISTS AND DISTINGUISHED VOCALISTS

Will give a Grand Musical Concert at the Pavillion each evening from September 15th to 20th.

THE COUNTY EXHIBITS made at these exhibitions have attracted more attention to localities represented than any other form of advertising advanced.

EVERY COUNTY IN THIS STATE should have an exhibit. Begin with harvest and secure samples of your products. The money premiums will almost pay the entire cost of your exhibit.

NEW-COMERS ARE AWAITING to view the products of the State before locating. Hence it behooves every county to be up and stirring.

IT IS AT THESE EXHIBITIONS the Manufacturer meets the Merchants of the interior.

IT IS AT THESE EXHIBITIONS the Merchant views progression made in all mechanical and industrial callings. Hence it behooves the Manufacturer to be up and stirring.

AT THESE ANNUAL EXHIBITIONS the visitor may combine business with pleasure, as the Board of Directors provides for all kinds of recreative amusement in the varied program of events.

THE CONTESTS OF SPEED showing advancement made in the breeding of high-class horses, will be a feature.

THE GRAND PARADES OF LIVE-STOCK will embrace the various classes of horses, and all the improved breeds of cattle.

OPEN-AIR AMUSEMENTS FOR THE DAY and MUSICAL CONCERTS FOR THE EVENING will afford ample entertainment for all who visit the State Fair.

Every attention will be rendered exhibitors by the Board of Directors.

Premium lists are now ready, and will be furnished upon application to the Secretary, who will also furnish other necessary information that may be desired. Apply at once for space.

Remember, the Southern Pacific Company TRANSPORTS ALL EXHIBITS FREE OF CHARGE to and from the Fair, and gives EXCURSION RATES TO ALL THAT ATTEND.

TWENTY-PAGE EDITION.

Vol. XL.—No. 8. SAN FRANCISCO, SATURDAY, AUGUST 23, 1890. DEWEY & CO., Publishers, Office, 220 Market St.

CALIFORNIA STATE LIBRARY.

THOROUGHBRED DEVON BULL, LOCK 3677 OWNED BY J. R. ROSE, LAKEVILLE, SONOMA COUNTY, CAL.

A Fine Devon.

We are pleased to give the place of honor in this week's RURAL to a representative Devon, for at least two reasons. First, the animal belongs to the rich region which will send its best products to the Petaluma fair next week; second, the Devons as a breed are not recognized for their full worth in this State. Fortunately a few breeders, notably Mr. J. R. Rose of Lakeville, whose animal we illustrate, have upheld the Devon standard and continue to do so, but regarding the State as a whole, it must be acknowledged that Devon merits and adaptations are not adequately considered. For this reason also we are pleased to lay before our readers a sketch of the achievements and claims of the breed which appears on page 157 of this issue. We are advocates of no particular breed, but rather of all good breeds, which should be selected and located wisely and with due reference to the characters of the lands to be devoted to them and the products expected of them. The Devon would undoubtedly become more prominent if his worth and fitness were better known to our people generally.

As the article on page 157 to which we have referred gives quite fully the claims of the Devons as a breed, we need allude in this place only to the representative of the race whose portrait appears herewith. He is a thoroughbred Devon and bears the name Lock, and his registry number is 3677. Lock was bred by Luther Rawson of Wisconsin from imported stock, and Lock's pedigree, which we have before us, traces back ten generations on side of both sire and dam, the earliest ancestor being Champion No. 26, which shows that his pedigree extends to the beginning of accurate Devon records. Mr. Rose's stock has been selected with reference to purity of descent as well as individual characteristics, and his herd traces directly to the herds of Messrs. Quartly, Davys, Bloomfield and other noted breeders, and to their most distinguished animals.

Mr. Rose's breeding-farm near Lakeville, Sonoma county, is almost an ideal location for a stock farm. It has upland and rich meadow. It is in a region of abundant rainfall, and in an atmosphere which, from its proximity to large bodies of water, is moist and favors late growth of feed. There is also enough exposure to free air to make animals hardy and hearty. The delights of the situation and the excellence of the stock will repay the appreciative visitor.

GEORGIA WATERMELONS.—The special investigation in "Truck-farming" in the agricultural division of the census office is already developing some interesting and valuable figures. The crop of Georgia watermelons alone this year will be 8000 cars of 1000 melons each. This yield of 8,000,000 melons will probably be increased next year to 10,000,000. One grower has 457 acres in this crop. They net the grower six cents each and leave the land in fine condition for the cow-pea crop, making two yields in one season. Georgia lands yield on an average 700 melons per acre, some experts getting 2000 to the acre. The railroads get about 12 cents a melon for moving the crop, or twice what the grower gets, each acre giving the railroads an income of $50. They are carried as far east as Portland, Maine, and west to Denver, Colorado.

TEXTILE INDUSTRIES.

New Zealand Flax.

As the plant called New Zealand flax (*Phormium tenax*) grows freely in the coast valleys of California, and as the plants, through distribution from the University and otherwise, have become widely spread, the following letter, which we take from a consular report issued by the Department of State, will be read with interest and may be suggestive of a profitable enterprise:

Inasmuch as flax fiber has become an article of considerable commercial importance in New Zealand during the past year, I have endeavored to procure some of the seed, which I forward herewith,* together with such information as I have been able to obtain in relation to the cultivation of the fiber. The purchase of New Zealand flax by the United States has largely exceeded that of any other country during 1889. I have therefore deemed it my duty, in view of the immense commercial value to which this exclusively New Zealand product has attained during the brief space of one year, to acquaint the Department of its growing importance as an article of export to the United States and other countries.

I am convinced, if handled with intelligence and care, that the *Phormium tenax* plant can be successfully and advantageously cultivated in the United States. The climate and swamps of many of the Southern States are peculiarly adapted to the propagation of New Zealand flax. The climate of California is also suitable for the cultivation of the flax plant. *Phormium tenax* is indigenous to New Zealand, Norfolk island, Chatham islands, and other smaller islands situate between 30° and 50° south latitude. The most robust and finest plants are to be found between 35° and 41°. It grows on any soil from the sea level to an altitude of 2000 feet, but it is found in the greatest luxuriousness in swamps and on the banks of rivers and lakes. The leaf or blade often attains the length of 15 feet and from 2½ to 3 inches in width. Before the Maoris adopted European clothing, considerable care was bestowed on the selection and cultivation of the plant by them. They dressed it by a process of steeping and scraping and hand-scutching, which produced a fiber almost as fine and glossy as floss silk, of which they wove their mats and "kakahu" (clothing). But of late years, since the Maoris have learned they can procure their clothing from their European neighbors with much less effort than they could manufacture it with the primitive methods at their command, no steps have been taken for the conservation of the better varieties.

The seed accompanying this paper is of a superior quality, was procured for me by a Mr. Jeffs, who has lived in this colony for nearly 40 years and who is thoroughly familiar with the flax industry of New Zealand. It may be proper to state that Mr. C. K. Jeffs of Onehunga, N. Z., is willing to furnish seeds and practical information to any one desiring to engage in the cultivation of *Phormium tenax* in America. The seed above referred to was obtained from an old Maori cultivation, and is highly prized by those natives who still devote their attention to the weaving of mats and other useful ornaments manufactured from the fiber.

The flax used for export is usually cut from the swamps, marshes and river-banks. It is in its wild, uncultivated state, and it is cut down and run through the machines without any attempt at selection. This is much to be regretted, as with a little care, even with the crude machinery in use at present, a much finer article could be produced.

The persons usually employed to cut the green flax are paid by the ton. It is therefore to their interest to get as much weight as possible, and, in consequence, they cut as close to the ground as they can. The lower end of the leaf is thick and fleshy, containing a large amount of gum and vegetable matter, and weighs heavily as compared with upper portions of the leaf; besides, the fiber obtained from the butt end is very much inferior in texture to that procured from the body and top of the blade.

To imperfect machinery and carelessness in the selection of green plants may be ascribed the apparent coarseness and inferiority so often complained of in the flax exported from certain portions of New Zealand. But with improved flax-dressing machinery and proper care exercised in the selection of the raw material, a very superior article can be produced. The *Phormium tenax* fiber is susceptible of a much higher degree of preparation than has been bestowed upon it up to the present. This, however, is not altogether the fault of those who are engaged in its manufacture; it is for want of the necessary machinery. The hand-dressed article prepared by the natives is as fine as silk as compared with the modern machine-dressed flax of to-day. This only demonstrates the fact that the fiber may be reduced to a much finer quality, and all that is necessary to do this is an improved machine. If New Zealanders cannot produce the requisite machinery, I trust the inventive genius of America will come to the rescue. There is certainly a splendid opportunity and a fortune for any man who will invent a machine that will successfully and economically reduce New Zealand flax to a proper degree of fineness.

Many who profess to thoroughly understand the toughness and durability of the *Phormium tenax* believe that if it could be properly reduced it would enter largely and successfully into the manufacture of valuable textile fabrics.

The quantity of seed I have forwarded to the Department, I am reliably informed, is nearly sufficient for an acre of ground, and with ordinary care in its cultivation will be in a proper condition to send to the "flax-mill" at the expiration of three years from the date it is put in the ground. It takes about 1200 healthy plants to the acre, and, to use Mr. Jeffs expressive language, "in three or four years it would be so close you would hardly be able to ride a horse through it."

For additional information on the subject, reference to my report to the Department dated Dec. 31, 1889, may be of some value.

JOHN D. CONNOLLY, Consul.

United States Consulate, Auckland, March 6, 1890

*Sent to the Department of Agriculture.

THE VINEYARD

Resistant Vineyards.

NUMBER II.

[Written for the RURAL PRESS by W. B. WEST.]

We have seen in a previous communication (RURAL PRESS of Aug. 9th) that the experience of Europe is almost universally in favor of American resistant stocks. The next important question, then, will be what variety of stocks should be used.

The vine-grower who is in danger of phylloxera should commence a series of experiments to determine the kind best suited to his soil—that is, if the matter has not been previously settled by the experience of his neighbors. Then it would be an economical plan to plant cuttings of these stocks in nursery, so that he will have them at hand when they are wanted, for it is not always possible to get them from the nurseryman, and when obtained they would not be so reliable as those grown at home, or, in other words, the proprietor can take more care in the growth and handling than the nurseryman can afford to do. Experience has proved to me that rooted vines are better than cuttings. I therefore never plant anything in vineyard but stocks that have been in nursery one or two years.

A saving of time could be made if nurserymen would graft some of the most approved kinds and have them for sale at moderate prices. French nurserymen advertise many of the prominent wine varieties grafted on the different resistant stocks at $40 per thousand.

Seedling vines have been recommended by some as being hardy and making better roots than cuttings. I have found the opposite to be the fact. The cuttings formed a good system of roots, were more sure to grow when transplanted, and made better wood to graft into; the seedling wood was very difficult to graft and the roots were very poor.

Propagation of Different Resistant Vines

The Riparia grows easily from cuttings and does not require much effort in ordinary soil to get all the stocks necessary.

The Lenoir—Cuttings of this variety are difficult to root. I plant them in beds of four feet wide and as long as is practical to irrigate, where the slope is gentle, say 80 feet long. The cuttings are planted across the bed four inches apart; the rows may be one foot apart. The borders of the bed should be raised in order to keep the water on the plants. To those who have no experience in irrigation, I would say that a vine cutting in the spring, when the roots are pushing, requires the soil to be wet (not moist as some suppose), and if irrigated freely, then many cuttings will strike that would perish if neglected.

The selection of varieties for stocks, as I have said before, is a delicate matter and should be looked into thoroughly before deciding what kind to use; for instance, the Riparia is probably the best stock known for universal planting and yet on my place is useless. The stock must be thrifty and suited to the soil, or it will not be resistant. I will only mention a few of the best known kinds.

Adaptations of Resistant Varieties.

Vitis Riparia is probably the best suited to most of the soils of California. It is very resistant and on sandy or gravelly loams does well, but does not thrive on my place, where the soil is deep and rich but rather dry. It takes the graft easily and forms a good union. It strikes easily from cuttings.

V. Rupestris is an utter failure here. It is of slow growth, making small wood, and when grafted grows poorly.

V. Æstivalis—One of the best known of these is the Lenoir. This has proved the most successful of all the stocks that I have used. They grow freely in the worst phylloxerated ground, take the graft well, and so far, after an experience of five years, have proved satisfactory. The Lenoir should be planted in deep, rich soil with a dry subsoil. It may thrive on a shallow soil a year or two and then die.

V. Californica with me is a failure, and after five years' trial I was forced to dig them out. They have not proved wholly resistant, or satisfactory in ground free from phylloxera.

Nuevo Mexicana, from Texas, has proved an excellent grower, exceedingly well adapted to dry ground. Vines planted late in the dry years of 1887-8-9 in badly infested ground have grown well, even better than the Lenoir. Some vines received from the Viticultural Commission in May of 1889 have grown well under the most adverse circumstances. It roots easily from cuttings and promises to be a better stock for dry land than any that I have knowledge of. Another variety from same source is the *Berlandiera*. It is well adapted to very dry soils. These varieties may make it possible to plant resistant vineyards where other kinds will not succeed. I have never grafted either of these kinds, but as they are quoted in French catalogues, they must be known to be resistant.

Grafting Grapevines

Does not require much skill. The most important factors are, the proper time to do it and the proper condition of the cion. The best time to graft is in the spring, when the new wood has made a growth of from two to four inches. At Stockton this is from the 1st to the 12th of April. The cions should be cut in February and heeled in on the north side of some building or in an open shed, where they will remain dormant until the time for grafting.

I usually employ three men in a gang—two to dig around the vine and fill up around the cion, and one to graft and tie. I do not exact a large amount of work, but insist on its being done well. Grafts are put in two to three inches below the surface; in dry years a little deeper. The dirt is hilled up to the top of the cion. My average of success in five years has been 90%; a few failed to unite, more were displaced by after cultivation, and now and then one was lost by digging to remove the suckers from the root and the roots from the cion.

For tying, I use baling rope and have found no occasion for anything better. My stocks are now nearly all Lenoir and about the same size, from one-half to three-quarters of an inch in diameter. The larger size are cleft-grafted, but on the smaller I employ a method of "side grafting" entirely new to most vine grafters, but not to nurserymen who graft delicate evergreens. I make an inclined cut, an inch or more long, down the stock, cutting to the middle of it; the cion is then cut to fit it. By this method two excellent surfaces, each an inch or more in length, present themselves for the cion to unite with. It is then tied firmly, but no clay nor wax used. A portion of the top is cut off, but enough is allowed to remain to draw up the sap. When the cion has grown a foot or two, the stock is cut off at the union. The value of side-grafting is best seen in dry seasons. The stock draws up the sap and keeps the cion moist and more sure to unite and grow. If it should fail, the stock will be there, healthy and strong for another year. This is not always the case when the stock is cut off, as is the case in cleft-grafting.

At first sight it would seem that this method requires more labor than cleft grafting, but it is not so, as continued effort is required to keep the suckers from the stock and roots from the cion in both cases, and the little extra trouble of cutting off the stock after the cion has firmly united is more than counterbalanced by the less number of suckers made where there is an outlet for the sap.

Summer treatment requires continual watchfulness to keep suckers from the stock, and in a wet spring like the past, to take the roots from the cion. When thrifty varieties such as table grapes are grafted, much care is necessary during the months of May and June to prevent the young shoots from being blown off. They should be tied up, and in some cases the ends cut off.

Characteristics of Varieties Which Have Been Grafted.

The Black Prince, or Rose of Peru, is a variety unusually subject to black knot. I find that by giving it plenty of wood the difficulty is lessened. It unites better with the Lenoir than with the Californica.

The Flame Tokay unites well and makes a good vine.

The Black Ferrow pushes its shoots vigorously in the spring, many of which will be blown out if not properly tied up.

The Emperor is a very strong grower and hard to manage on that account. In most cases the vine is twice as large as the root—this is the only doubtful case that I have among all the vines that I have grafted.

Most wine varieties unite well and give me no trouble.

Will They Bear Well?

The next question that is continually thrown up to me by the doubters—Will these grafted vines bear as well as they did on their own roots? From my own experience I cannot say, as my oldest grafts were lost on account of not being on proper stocks. Vines three and four years old show remarkable fertility.

I have to fall back upon French authority. Many reports of Vine Commissioners, most reliable and of undoubted authority, state that the grafted vineyards show remarkable vigor and bear unusually heavy crops, especially with the *riparia*. I see no reason for a doubt in this matter. Most of the resistant vineyards of this State are still young and cannot be expected to show full crops until at least five or six years. I think time will show that on the proper stocks our vineyards will be even more prolific on resistant stocks than on the *vinifera*.

The Future of Viticulture.

It is true that there have been many discouraging circumstances connected with viticulture—the heavy losses by the phylloxera, the low price of vine products (wines, brandy and table grapes), which have ruled during the three past years, has been disheartening, but I think the experience will not be wholly lost. Younger men will start with a knowledge of the past. They will reconstruct the vineyards with resistant stocks, will graft more desirable varieties, will make better wine and establish business on a better basis.

The outlet for table grapes is increasing. I can recollect when a carload would glut the Chicago market, where now a train is demanded. Oregon, Texas and the Territories are now great consumers. These considerations should encourage us to renew our vines and maintain the industry.

Stockton, Aug. 14th

FRUIT MARKETING.

Fruit Sales in New York.

EDITORS PRESS:—The past week has been a very eventful one in the history of the California fruit trade, so far as New York is concerned, 34 carloads having been disposed of from Monday until Friday. Owing to low prices ruling in Chicago during last week, our Monday's market opened with prices ruling at $3.50 on Bartlett pears, $1.60 a box on peaches and plums, and prunes at about from $1.75 to $2.

In spite of the daily sales that were held of from four to nine cars, we were able to force the market up each day about 10 cents on peaches and 25 cents on pears, with about 25 cents as a total advance on plums and prunes. At my Thursday's and Friday's sales the average on pears was about $4.75 per box, with fully 3500 boxes of peaches averaging $2.15.

The demand has been good and the market firm, and inasmuch as new buyers are daily coming into the salesroom and commencing to handle California green fruits, the outlook is favorable for the balance of the season. It is a significant fact that small dealers in the interior of the State are now having daily supplies of California fruits shipped to them by the jobbing houses, and that this is not confined to the near-by towns, but extends for a radius of 500 miles from New York.

Tokay grapes have opened well as regards prices, single crates from Vacaville having been sold this week by me at $5.10 per crate, equal to $10.20 for crates of 40 lbs each.

New York, Aug. 9th. E. L. GOODSELL

A Package of California Apricots.

EDITORS PRESS:—In a letter just received from a San Francisco lady now in the East, she writes, under date of July 30: "I have just returned from a shopping trip to New York. While there I bought one of those small wooden baskets of apricots, not holding more than four pounds, and for which I paid $2."

Think of it! Fifty cents a pound! Of course they must have been California apricots. Would it not be interesting to trace that basket back to the grower, to see that $2 dwindle down to what he received, probably 10 to 15 cents for the four pounds at the outside?

Then if any quantity can be sold in New York at 50 cents a pound, how great a quantity could be sold at 10 cents per pound?

MIRAMONTE.

A Decision on a Sale Contract.

The Watsonville *Pajaronian* describes a case which will interest all fruit-sellers as follows: Last Friday Judge Swank had an all-day session with the case of R. H. Pearson vs. L. G. Sresovich. The former owns an orchard about one mile east of town. On the place is a patch of raspberries, which has been leased and handled by J. R. Strange for the past two years. Sresovich bought the fruit on the place this year, but Pearson's understanding, in making the sale, was that he sold the orchard fruit and not the crop of the berry-patch which was leased to Strange. Some time ago Sresovich saw that he would run behind on the orchard, and he refused to make the final payment unless the berry crop was given him. This Pearson refused to do, and he entered suit for $299 99. The case was heard on Friday, and attracted much notice. A number of expert witnesses were examined and the main point appeared to be the definition of the word "fruit." The court held that Pearson sold only the orchard fruit, and gave him judgment for the full amount. As the opinion was written, we have been requested to give it in full. It is appended:

"The law is, relating to contracts that where through fraud, mistake or accident a contract fails to express the real intentions of the parties, the intention may be ascertained by parol evidence.

"Words are to be interpreted as usually un-

derstood by persons in the business to which they relate.

"A contract is to be interpreted according to the law and usage of the place where it is to be performed.

"A contract may be explained by reference to the circumstances under which it is made and the matter to which it relates.

"In the construction of an instrument, the intention of the parties is to be pursued, if possible. From the law, evidence was necessary to interpret the contract in question to ascertain the intent of the parties—what they meant by the word 'fruit' at the time the contract was ratified.

"'Fruit' being a comprehensive term, it is necessary that a limit-line should be interposed. From the evidence in the case, the court is convinced that berries were not included in the purchase and sale of the plaintiff's fruit crop and that he is justly and morally entitled to recover. Judgment is therefore given to the plaintiff for $299.99, the sum asked for in the complaint, with costs."

Florist and Gardener.

The Canchalagua.

EDITORS PRESS:—If you visit this winter some of the Spanish sections in Southern California, where the large, spacious adobe house still remains in fashion, you may from curiosity desire to cross the threshold of some humble Mexican family or even to glance within the squalid hut of the Indian. Should you do any of these things, it is more than likely that you will find carefully hung in some safe place bunches of a little plant that has been dried for use in case of emergency.

The plant to which I refer is the *Conchalagua* or *Canchalagua* of the Mexicans and Indians, the Californian pink or centaury of the English race, *Erythraea venusta* of botanists. Medicinally this plant possesses valuable antiseptic and febrifuge properties and is in high repute as a bitter tonic and stomachic. With the old Mexican families and the few surviving Indians it is an ever-present and valued household remedy, and is seldom missing from their rafters, together with red-peppers and "jerky," when they have not become too civilized for these luxuries.

Some have asserted that this plant forms the basis of the widely advertised medicine known as August flower, but of this I have no satisfactory proof. However, it is used by the the medical profession to a considerable extent, and I have an order from a prominent homeopathic firm for a quantity of the drug.

But it is not to the real or fancied medicinal qualities of this herb that I would call attention, but rather to its surpassing loveliness as a flower, ranking among the foremost of the many handsome flowers which California has given to the horticulturist.

It seldom exceeds a foot in hight, the plant being a low-branching annual, bearing a multitude of showy flowers on pale-greenish stems with light apple-green foliage. The corolla is rotate, with a slender tube and five (rarely four or six) divisions. The corolla exceeds an inch across, the five divisions of a brilliant shade belonging somewhere between solferino and magenta—too dark and brilliant for rose-purple, with a narrow white circle where the five divisions unite. The center and tube of the corolla is of a greenish sulphur-yellow, while the prominent exserted, erect, spirally twisted anthers are of a brilliant lemon-yellow. The slender style and filaments are white, the stigma of a delicate sulphur-yellow.

The blossoms close their eyes upon the going down of the sun, turning their fresh faces to him again as he rises in the east. Not until after the last rains of the season, and May Day is safely past, does the canchalagua put out its stars of color; but from then on to the middle of July it replaces the earlier spring flowers and gives the eager schoolchildren pretext for wandering over hill and mesa in search of flowers.

And such bouquets as they do gather! Nothing but apple-green and solferino which match well with the children's happy faces; and these flowers seem to mind their rough handling the least bit in the world. Whether left by the roadside, or in the hall to wither, or in a parlor vase without a drop of water, they still persist for days and weeks in turning a bright, independent face to the sunlight as if they were contented, as no doubt they are.

While the flower is usually nearest akin to solferino in color, yet sometimes, though rarely, it is of a delicate pale lavender or else pure white. In 1884, I gathered numerous examples of this with pure white corollas, and on sending specimens to an eminent botanist, he was at first inclined to consider it a new species, until I explained that they were innocent albinos, with no intent to deceive.

The plant is widely distributed on the Pacific Coast, throughout Southern California, southward, I believe, to Chili, in South America, where it first gained notoriety as a medicinal herb. In Southern California it is quite variable, sometimes with quite small, inconspicuous flowers, but more commonly with the large brilliant flowers, as above described.

The genus contains numerous European species also, and belongs to the well-known Gentian family, so many members of which belong in good society that I do not hesitate to introduce this new beauty to horticultural circles. Dr. Veit Brecher Wittrock, of the Royal Academy of Science of Stockholm, Sweden, has made a special study of the genus. At his request I sent him the Californian forms accessible to me, and among them he found one (from Washington, collected by a correspondent,) that was new to science. He made carefully prepared figures and descriptions of our canchalagua and its relatives, but his introduction only brought it to the attention of botanists—not to horticultural notice.

Doubtless it would do well in cultivation if given a little encouragement and not too much water. Try it when you can get the seed.

San Diego. C. R. ORCUTT.

Cabbage-Growing in San Diego.

R. H. Young, secretary of the Producers' Union, writes as follows to the San Diego *Sun*: This seems to be an unfortunate year for nearly all of the Eastern and Central States. The fruit crop, taking it altogether, is less than half what it usually is, and some of the other crops are not nearly what they should be. The hot weather in some portions and dry in others is cutting even the vegetable crop short. Take Ohio, for instance, with its Miami valley, one of the finest in the country. The elements have been such that the vegetable gardens and fields are yielding very much less than in other years, and to-day vegetables are very scarce in Cincinnati and other cities of that region. If this is the case now, what will it be next winter?

The above by way of introduction to a cabbage letter.

It seems more than probable that there will be an excellent demand for cabbage in all the Northern States next winter and spring. California ought to supply the demand, and no other portion of this big State can do it easier than the southern.

As stated before in these letters, the Early Jersey Wakefield is the best kind. Small, solid, conical heads are preferred, for the reason that they ship better and sell better than do others. By the time California cabbage reaches the East, is handled by one or two commission men and then by a retailer, the price is up to several cents a pound. If the heads are too large, families, except the rich, will not buy them. If they are small, anybody who wishes cabbage can get just what he desires.

This cabbage seed costs the Union $3 a pound and the freight. It is turned over to the growers at cost. In one ounce there are 2000 seeds. Because of the small heads, 12,000 Jersey Wakefield plants are put on an acre, so it takes six ounces of seed per acre, or a little over a dollar's worth.

It is not yet time for those who have no water to put the seed in the beds. Rains cannot be calculated upon before some time in November, possibly the first of December. As a rule, those who cannot irrigate should not put out the plants until the first rain. Those who have water should sow the seed-beds for the first planting by the last of this month, so as to have the plants ready some time in October, and hence cabbage ready for market by the latter part of January or the first of February. The second planting should go in about a month later.

The first supply of cabbage seed received was exhausted several days ago and another order sent in. It is now all engaged, and a third order will be forwarded to-day. All who are intending to raise cabbage, especially of the Early Jersey Wakefield variety, should send in their orders for seed at once. It takes from two to three weeks to get it from the East, so it should be ordered while there is plenty of time.

Fruit Preservation.

Fruit-Drying in Los Angeles County.

EDITORS PRESS:—A visit to the Monrovia fruit-drying grounds at this season is one of the most cheering and inspiring pleasures to the lover of rural scenes and to all engaged in this industry.

The oldest deciduous orchards are not more than ten, and the majority from five to seven years old. The pioneer settler in this district, Mr. Monroe, some eight years ago planted his fine domain liberally with all deciduous varieties, even cherries. Our way led through East Pasadena, where Mr. Bonine with some 30 cutters was harvesting apricots and nectarines, one of the most perfect crops for size and beauty we had ever seen. On through the Sierra Madre, and some miles of wild pasture, exactly like the acres transformed so recently into these rich plantations.

At Monrovia we found seven acres covered with drying-trays, laid out most conveniently for handling, and cut at suitable distances by tramways for moving this immense crop. At a little distance this drying-ground seemed a wonderful crazy quilt of color, the bright gold of the Crawfords shining against the more silvery white peaches; the delicate lilac of the nectarines relieving the intense apricot yellows, while nearer the center of operations the fruit fresh from its bath of glucose glittered in the sun.

Under the cool sheds the women, boys and girls of Monrovia were earning from $10 to $12 a week, some working by the box—the more expert earning $1.50 per day. A few worked in the evening, as the sun hurried up the work.

John H. Leslie & Co. of Chicago are furnishing a market and all needed facilities for handling the deciduous fruits of this neighborhood, including the later plums, prunes and pears. They have now been cutting six weeks, and the late peaches will run into September.

On the day of our visit they were loading the eighth car, each car holding 22 tons of dried fruit. It was estimated that from 10 to 12 more carloads of apricots would be furnished in the Monrovia neighborhood. The agents of this house are also purchasing dried fruit along the line of the Santa Fe railroad.

The late peaches will carry this work into September, and the prune harvest promises to be large. The price of dried apricots ranges from 12 to 15 cents per pound; and so favorable has been the season for ripening that the color has never been so uniform as this year.

The prunes are mostly of the variety Petite d'Agen; around Pasadena thousands of trees are in bearing from buds obtained at Carmelita from trees of undoubted pedigree. Mr. J. Routier of Sacramento county, who furnished them, obtained his stock directly from the Agen district in France.

Almost in sight of the Monrovia drying ground is the fine orange orchard of State Controller Dunn; and all the wealth of the Duarte orange groves, now rejoicing in the total disappearance of the cottony cushion scale. The prospect of the grape crop also brightens as we move eastward toward the old vineyards of Cucamonga, never so rich in leafage and fruitage as in this moist year; while thousands of town lots in Los Angeles county are groaning under their crops of corn, Lima beans and pumpkins, sure tokens of renewing prosperity.

JEANNE C. CARR.

Carmelita, Aug. 8, 1890.

[Such a note is eloquent of the permanent prosperity of the South country. We trust our esteemed correspondent may find leisure to send many more like it.—EDS. PRESS.]

Fruit Drying at Tulare.

We condense the following from the Bakersfield *Echo* of last week: At Paige & Morton's fruit farm, a few miles from Tulare City, on a single day, 99,370 pounds of ripe peaches were set out to dry. High-roofed, unsided sheds are filled with tables, and at these sit a chattering group of 175 to 200 boys, girls, women and men, all busily splitting, pitting and spreading the fruit upon trays. The tables are about 16 feet long, and six or eight operators sit upon one side. The tables are arranged in pairs, so that between each couple those who serve the fruit and trays have an alleyway for their work.

The work is paid for at a rate of 3 cents per tray. The trays are about three feet long and two wide, with a narrow rim on each side. The operator takes a peach in the left hand and with one cut severs the fruit to the pit, with a rapid twist then flirting out the pit, and then, with the left hand, laying the halves down, cut side up, upon the tray. There is one bright-eyed little lady whose daily average is 70 trays. The best ever done by an operator was 110 trays. As soon as the tray is filled, the call "tray" is made, and the attendant takes the filled one and places it on a car so constructed as to hold about 100 trays, placing an empty tray before the operator. As soon as the car is filled, it is run outside of the building into the sulphur-house. This place is only a little larger than the car. A pan with about two pounds of sulphur is placed beneath the car and ignited. The door is tightly shut, and the car and contents indulge in a sulphur bath for about 20 minutes. Then the car is run out to some vacant space amid the drying-racks, where the trays are placed in the sun for from three to five days. When dried, the trays are brought back and the contents emptied into "sweat-boxes" and stored, one above another, in a rather tight wooden building.

There are many other enterprises carried on under the same roof, such as packing choice fruit in 20-pound boxes for shipment to the East, peeling other choice fruit by the lye process before halving for drying, and so on.

MECHANICAL DEVICES.—Perhaps, says a cotemporary, one of the best examples of a mechanical device working its way into great prominence against early prejudice is found in the steam pump. When the late Henry R. Worthington invented his direct-acting steam pump and proposed to use it for feeding boilers, he was met by eminent engineers to whom he showed it with the remark to the effect that, while it was ingenious and all that, no one wanted such a pump. This was the first reception of a machine which, in various forms and modifications, made by different manufacturers and for different purposes, is in use in every civilized country in the world and on board every steamship. No one doubts its utility or its influence on mechanical progress. Perseverance won in the instance of the steam pump, as it has in the instance of many another invention. It is not wise to drive bull-headed against all mechanical opinion, and it is equally unwise to be turned aside by every contrary opinion. Mr. Worthington's belief in himself has been an excellent thing for the world.

The Dairy.

The Columbian Dairy Association.

A meeting of delegates from the most prominent dairy associations of the Union was held in Chicago, July 16th, for the purpose of representing the dairy industry at the World's Fair, and that through their organization the Commissioners of the World's Exposition might be notified of the wishes of the dairymen.

Governor W. D. Hoard of Wisconsin was selected for president; R. Lespinasse of Illinois for secretary, and John Boyd of Illinois for treasurer.

The president appointed a Working Committee of 21 to originate and perfect suitable plans for the dairy exhibit to be presented to the World's Fair Commissioners in October.

Several of the State Dairy Associations pledged $200 to defray necessary expenses until the Legislatures of the different States would meet. The following resolutions were adopted:

WHEREAS, The dairy interest of the United States is of such vast magnitude, reaching in annual increment an aggregate of $640,000,000, giving employment to hundreds of thousands and representing a capital of over $2,000,000,000; and

Whereas, It is of great importance that this vast interest should be adequately represented at the Columbian Exposition of 1893, this convention, representative of dairy organizations, desires to give expression to the following resolution:

Resolved, That the World's Fair Directors be urged to provide buildings suitable for caring for dairy cattle, milk, butter, cheese and machinery adequate to keeping working dairies on exhibition each day of the fair, that it may be educational as well as artistic; and that a commission be appointed to visit every section of Europe having dairy interests and solicit exhibits.

Upon call of the president, the Advisory Committee met at the Sherman House in Chicago, July 30th, and elected Wm. H. Gilbert of Richmond, N. Y., chairman; W. H. Morrison, Madison, Wis., secretary; and John Boyd, Chicago, Ill., treasurer. A general discussion in reference to a working dairy and dairy school in connection with the general exhibit of dairy products and dairy utensils, with a written communication from J. H. Monrad about foreign exhibits, the working dairies, implement show, premiums for dairy products, and plan for the buildings, resulted in the selection of the following sub-committees: Committee on Buildings; Working Dairies; Dairy Cattle; Butter and Cheese; Dairy Utensils; Miscellaneous.

The secretary and the sub-committees were instructed to procure all the data in their different departments that could be obtained, as a meeting of the committee would probably be called the latter part of September to report to the Commissioners of the World's Fair in October.

The dairy department of the World's Fair must be something more than a large show of dairy cattle and their products. The different methods of separating the cream, the working dairy, giving daily exhibitions in the manufacture of butter and cheese, will be practical and educational; and this great dairy school, with students from every nook and corner of our country, will be the means of increasing the percentage of first-class dairy goods, and will add millions of dollars to our dairy industry.

Answers Desired from Dairymen.

At a meeting of the Advisory Committee of the Columbian Dairy Association held at Chicago July 30, it was decided that the committee will be unable to present plans and specifications to the Commissioners of the World's Fair, in October, commensurate with the importance of the dairy industry, without a full interchange of views. Have the kindness to answer the following questions at your earliest convenience:

1. Do you think it practicable to continue the exhibition of dairy cattle during the entire six months of the fair?

2. Should exhibits of dairy stock be unlimited as to number and quality, or restricted by the Commission?

3. Can you give me an estimate of the dairy cattle, either by cattle clubs or individuals, that will probably be exhibited?

4. Do you or do you not think it would be for the interest of the breeders of dairy cattle to exhibit such cattle in conjunction with the general dairy exhibit rather than with the general live-stock exhibit?

5. Will you give me your judgment as to the best method of exhibiting dairy cattle?

6. Shall we have a working dairy during the entire fair?

Your answers to the above questions, and any estimate or suggestions that you may give us, will be of great value to our committee in presenting to the Commissioners the wants and needs of the dairy industry in making an exhibit that will command the commendation and approval of all visitors.

Madison, Wis. W. H. MORRISON, Sec'y.

[Mr. Morrison invites correspondence from dairy associations on the above subjects. As there is no active State association of dairymen in California, it would be well for some of our progressive dairymen to correspond personally with Mr. Morrison, that our great dairy State may not go unrepresented in such an important undertaking.—EDS. PRESS.]

PATRONS OF HUSBANDRY.

In our Rural Press Official Grange Edition, issued every week, will be found additional matter from this and other jurisdictions, of interest and importance to Patrons. Any subscriber who wishes can change free to that edition.

The College-Endowment Bill.

In a letter to the Cincinnati *Grange Bulletin*, dated 23 inst., Prof. W. A. Henry, Director of the Wisconsin Experiment Station, speaks as follows regarding the Morrill bill for the endowment of colleges of agriculture, etc.:

"Any money given by the Government to agricultural colleges should be appropriated only after the most careful restrictions have been thrown about it. This is only fair and business-like. If Congress intends the money to be used for agricultural and mechanical colleges, let it say so, and that in unequivocal sentences; then there will be no disputes nor quarrels hereafter. No one will be enabled to interpret doubtful sentences in favor of the general use of the funds.

"Let no ammunition be used, however, to kill the bill, but rather to see that amendments sufficiently explicit are added to the bill; then that it is put through. Under proper restrictions the gift will be of great value; given without restrictions, it will be a source of trouble and irritation to every State and school that receives it."

The *Bulletin* editorially gives Prof. Henry's views a hearty indorsement, adding that farmers cannot get mad and try to kill such an important bill, but must see that it is passed in proper form.

On Tuesday of this week the U. S. House of Representatives took up the Senate Agricultural College bill. J. D. Taylor of Ohio spoke in favor of a proposed amendment providing that the appropriations be applied only to instruction in agriculture, mechanic arts, the English language and various branches of mathematical, physical, natural and economic science, with special reference to their application in industrial life, and to provide the facilities for such instruction. After a long debate the amendment was agreed to, and the bill as amended passed without a division.

As the amendment thus agreed to is the one for which our Legislative Committee at Washington has been so strenuously contending, we feel much gratified at the action of the House, and hope it will speedily be ratified by the Senate

Eden Grange.

EDITORS PRESS:—Eden Grange held its regular meeting Aug. 9th and gave a

Reception to Sister and Brother Adams.

Grange opened at 1 P. M. On account of the brief stay of W. S. M., DAVIS, who had accepted an invitation to be present, all the regular business was postponed until later in the day, and the first hours were spent in listening to W. M., DAVIS and partaking of lunch.

After lunch, Brothers Adams and Blackwood gave utterance to some stirring sentiments on the farmer as related to the political questions of the day, Bro. Adams telling of his experience in visiting the halls of Congress and the manner of disposing of some of the great problems by the law-makers, while Bro. Blackwood never tires of showing up the tariff system. Sister Adams and Bro. Renwick advocated the social features of the Grange as of far greater interest than the political, taking the position that if the social was carried to the highest, purest standard, the political would necessarily be better understood and more honorably followed. Sister Adams told of her interest in "Woman's Work in the Grange," and appreciation of the sentiments and methods of Sister Kinney's circular.

They were followed by Brother Dennis, speaking eloquently on "Woman in the Home," and her unequal hours of labor as compared with man's. Bros. MONSEN, HOLLISTER, PERHAM and others spoke on the meeting of the State Grange. J. S.

AS EDUCATIONAL AGENCIES.—The *Torch of Liberty* says: If the farmers' organizations could accomplish nothing more, they have proved to be one of the greatest schools of political economy ever known and are doing more to set the people to thinking for themselves, instead of allowing others to think for them, than any other society in existence. Go where you may, you will find the masses talking intelligently upon subjects that two years ago they were wholly ignorant of. They no longer look to party bosses for their opinions, but study for themselves.

YUBA CITY GRANGE.—In order to avoid clashing with the District Fair in Marysville, the next meeting of Yuba City Grange had been fixed for Aug. 30th; but as the annual meeting of the Anti-Debris Association takes place upon that day, the date of the Grange meeting has been changed by the officers to Friday, Aug. 29th, at 10 A M, when the third and fourth degrees will be conferred, with a Harvest Feast.

BRO. GEORGE ABBEY has been elected Secretary of Watsonville Grange in place of Sister Kidder, resigned.

The Master's Desk.

E. W. DAVIS, W. M. S. G. OF CALIFORNIA.

It is more than gratifying to those of our Order who have been faithful to its principles and purposes to know that during the first half of this year there have been 363 new Granges organized. In addition to this, there has been a large increase in the membership of Granges already in existence.

The farmers of America are awakening to the power and influence that the Grange has to bestow, and it is safe to predict that in a short time the Order of P. of H. will be more powerful than ever before. The work accomplished during the present session of Congress by the Legislative Committee of the National Grange has done much to confirm the Patrons in the belief that to be a member of the Order is no idle honor.

The more the farmer learns of the ways of the world, especially of the commercial and financial world, the more the Grange will grow and flourish. Every member of the Order has, or ought to have, a heart for those who are poor and ignorant and yet are striving for light, liberty and better life. Let us help them. The Grange *can* do it. The Grange *will* do it. Fellow-farmer! join us in this noble work. Be a true and faithful Patron of Husbandry!

Educate the boys to be farmers! A college-bred man can find ample field for all his talents on the farm. He need not study law, medicine nor theology merely because he is a graduate. Try the farm! There is room for plenty of thoughtful men on our farms—in fact they are much needed. Brain and muscle make a splendid farm team.

Stand by the Grange if you want your taxes reduced; if you want pure elections; if you want competency in office; if you want better times.

Do you know, if the active, energetic, live Patrons of America were all in line, that the army of Grangers would be larger than the combined armies of Lee, Johnson, Grant and Sherman? Yet so it is! And still the people stop to say: "We can't *do* anything." Just think about it for a moment and see if we can't. See if we won't! See if we haven't!

There is no politics in the Grange, but there is lots of common sense that proposes to stop this foolishness and roguery of pot-house politicians.

There is money to be made by joining the Grange, for there are brainy men and experienced and virtuous women there, who are fighting, praying, working for the welfare of their common country and of mankind. Don't you think such associations are valuable?

Be careful of extremes! Better be cautious and be right than be hasty and be wrong.

The fruit harvest in California is bringing a good deal of needed money to our farmers. Surely they will need it all this fall about tax-paying time.

County fairs are now in progress. How much of the money appropriated therefor by the State will go to the farmers?

Only a few weeks till the State Grange. Are you ready for the session? Deputies and Masters of subordinate Granges, and all officers of the State Grange, will please have their reports ready.

Don't forget to study up the Australian Ballot law, for that subject will in all probability be discussed at State Grange. Bro. J. D HUFFMAN is an encyclopedia on the subject. For full information write him at Lodi, Cal.

Grange Fairs.

The New Hampshire Grange Fair Association was instituted for the purpose of promoting the agricultural and mechanical interests of the State and the welfare of the Patrons of Husbandry. Its constitution provides that the Board of Directors shall consist of one member elected by each subordinate Grange in the State and the president and secretary shall be *ex officio* members with full privileges. The officers and Executive Committee of the State Grange, and the directors, as elected by the subordinate Granges, constitute the membership, but all fourth-degree members of the Grange are eligible to office in the association.

Secretary Geo. R. Drake of So. Pittsfield, N. H, has favored us with the official premium list, rules and regulations for their Fifth Annual Exhibition, which is to be held near Tilton, in the Valley of the Winnipiseogee, Sept. 10th to 12th inclusive.

The park wherein the fair is to be held is easily accessible by rail; contains about 50 acres; is carpeted with greensward; has a bountiful supply of water; neat, covered pens for cattle, colts, sheep, swine and poultry, and box-stalls for horses; an excellent half-mile track; spacious buildings for the display of farm products and agricultural implements; and an historic old church will be used for the exhibit of dairy products, flowers and fancy-work. A large grove at the upper end affords opportunity for people coming with teams to hitch their horses, and this retreat will be guarded by police during the fair. No gambling nor liquor-selling will be allowed upon the grounds.

The premium exhibits are confined to members of the Grange in New Hampshire, and all Patrons in the State are urged to contribute to the exhibition. The agricultural implement department, in which no premiums are offered, is open to exhibits by any one, wherever located.

The three days' program includes the showing off of draft horses, oxen and trained steers at the cattle ring; of walking and driving horses, farm teams, etc., on the track; of a butter extractor in operation; and trials of speed, but no races for a purse except one 300-yards footrace, where the prizes offered amount to $6! (six dollars!) Besides the customary addresses, there is to be an evening farmers' meeting at the town hall, for general discussion of agricultural topics, open to the public.

We have spoken thus particularly of this far-distant fair, because it seems to us that the Grange here on the Pacific Slope should take a more active part and claim a more controlling voice in State and county fairs, or else have fairs under their own direction and management, for the promotion of genuine agricultural interests.

A Visit to Watsonville.

EDITORS PRESS:—Saturday, Aug. 16, 1890, was a grand day for Watsonville Grange. The third and fourth degrees were conferred on a class of 35 by A. P. Roache, W. O. of the State Grange, assisted by the well-trained officers of the subordinate Grange. The W. M., Sister Roache, has not regained sufficient strength since her severe illness to perform all the labor pertaining to her office, but her vigilant eye was on every detail, and the presence of a masterly spirit was apparent in every move.

"Order Is Heaven's First Law."

Patrons, if you wish to see it exemplified, visit Watsonville Grange. Its members have been in perfect sympathy with their W. M. during her illness, and their faithful efforts entitle them to much credit for securing a class of 40 members, five of whom were unable to be at the meeting from sickness and other good reasons.

Lack of time prevented their carrying out their full literary program. The music was fine, and a dialogue by two little girls very amusing.

Bro. Roache met me at the train Friday evening and conveyed me to their lovely home, where I was introduced to the young Granger whose advent into this world was attended with such a mingling of pain and delight. "Granger" is his name—a name most appropriate for a baby boy whose features already show sparks of intelligence worthy of parents who have proved themselves so true Patrons of Husbandry.

I spent a restful Sabbath with Bro. and Sister Cox at their quiet home six miles from Watsonville, and greatly enjoyed the beautiful view it commands of valley, hills and mountains.

The Grain Crop

In this section is considered poor, but I saw some fields of corn, beans and sugar beet that are very fine. Some portions of the valley were completely submerged during the winter and produced no crop this season. The flow of water was impeded by willows growing in the river. An effort is being made to have them removed.

On our way to the depot, Bro. Cox pointed to a field and remarked: "Two crops of beets were grown on that field and then a crop of wheat. The wheat crop was as good as when the land was new. I don't think it was the beets that made the difference—it was the culture of the land." Thorough cultivation should be our motto, fellow-farmers. Let's extend it to ourselves and break up the monotony of farm life by calling dormant powers into activity. I. C. STEELE.

[With respect to the above meeting, "A. P. R." adds: The commodious Masonic hall was so well filled with Patrons and candidates as to remind one more of a State Grange session than anything else. The U. W. was exemplified by the veteran Past Master Steele (who, by the way, never omits to steal the love and respect of all who come in contact with him), in a simple and convincing manner. His eloquent words of wisdom, after completing the ceremony, will long be remembered.]

CALIFORNIA AT CHICAGO.—MRS. Flora M. Kimball appears to be the choice not only of the "Ladies' Annex," but of San Diegans generally, as *the* woman to represent Southern California on the Board of Managers of the coming World's Fair. We can think of no one more competent and every way desirable for that honorable office than the lady mentioned. She would certainly do credit to our Order and our State.

WORTHY MASTER DAVIS has recently returned home to Santa Rosa, after a ten days' absence. He was at Pacheco last Saturday, with Bros. Flint and Huffman, and writes that they had a fine meeting.

ANTI-DEBRIS.—The annual meeting of the Anti-Debris Association of the Sacramento valley will take place on Saturday, Aug. 30th, at 2 o'clock P. M., at the court-house in Yuba City.

Carpinteria Grange Picnic.

EDITORS PRESS:—The Grange picnic held in Franklin's canyon on Thursday, 14th inst., was a very pleasant affair.

By 10 A. M., the people began to arrive at the grove of live oaks and sycamores.

By 11 o'clock a delegation of the Farmers' Alliance and others arrived from Santa Barbara, Montecito and Summerland.

The orchestra made the air ring with sweet music, while with chat of friends and making new acquaintances the hour for dinner soon came, and judging by the lively converse and cheerful laughter, everybody present enjoyed the spread of good things.

Soon after dinner Bro. Webster by request explained to us how and why the Grange was organized, its purposes, benefits, etc. He was listened to very attentively and I presume his address will be given to the readers of the RURAL.

After Bro. Webster, Dr. Rush of Montecito being called for, came forward and addressed us on the necessity of organization. He said we should join the Grange, Farmers' Alliance, or some industrial union, to protect ourselves and get some compensation for our labor, etc.

About 4 P. M. the Grangers began to make their way to the hall, where the Grange was opened in due form. Bro. Webster was again called for under the head of "Good of the Order." We spent an hour or two in the exchange of ideas and posting ourselves somewhat in the work.

We will let Bro. Webster say what he thinks of Carpinteria Grange, which has struggled along since Aug. 20, 1873, and still has a little life left. O. N. CADWELL.

Carpinteria, Aug. 17, '90.

Past Master Webster's Account.

EDITORS PRESS:—At Carpinteria Bro. O. N. Cadwell met me with a Patron's grip. Thence through walnut groves and fields of alfalfa and Lima beans, we traveled two miles eastward to the picnic grounds, where were gathered about 150 farmers with their wives, children and friends. The location was at the mouth of a canyon in a fine grove of tall, trimmed, broad-branching live oaks. The feast was served before any other exercise was undertaken. It was certainly a sumptuous affair, spread on snow-white cloths on the ground, several hundred feet long, with every lady seated on the ground. For quality and variety of fruits presented the display has seldom been excelled, while the good matrons appeared to have samples of everything under the sun worth cooking.

After the feast and good music by the local band, came two speeches—one by a Granger and the other by an ex-preacher and present Alliance enthusiast. The whole affair passed off very pleasantly, and a more jolly, genial, Granger-like crowd it has never been my good fortune to meet.

About 3 o'clock a closed Grange meeting was proposed, and with this view fully 30 members of Carpinteria Grange repaired to their hall, where some two hours were spent in discussing Grange matters, exemplifying the secret work and talking of papers worthy of farmers' support. The officers understand their work well with an ever-watchful and intelligent membership. The valley being cut up into small farms occupied by a thrifty people, I think there need be no fear of Carpinteria Grange failing in the near future.

In the evening I went home with Bro. Cadwell, and from his elevated place beheld the sun apparently setting in the bosom of the Pacific ocean. Being some 200 feet above the sea-level, no frost nor chilling winds disturb his limes and bananas.

A Trip Around the Valley.

Next day we took a trip around the valley, which is about two miles wide by six miles in length, and wherein everything under the sun appears to grow. Lima beans are the principal annual crop, yielding from 1200 to 1600 pounds per acre, for which the farmers are offered 3½ cents this year.

All lands suitable for English walnuts are being set with that tree. Every acre of such ground, unimproved, will sell readily for $300. There are hundreds of acres already in bearing. Many thousands of the trees, from 15 to 20 years old, will each bear annually about 100 pounds of walnuts, which are now being contracted for at from 9 to 10 cents per pound. On the lower lands alfalfa is grown successfully, yielding two or three good hay crops a year without any irrigation.

After rounding the valley and visiting the homes of many Patrons, including that of the W. Master and W. Secretary, we finally reached the delightful residence of Bro. Blood. Being situated some 300 feet above sea-level, the whole valley, the ocean, hill and dale are spread out to the view of the observer like a vast panorama. Bro. B. has crossed the line of three-score years and ten, but physically, financially and socially he is well prepared to run past the end of this century. He says, in fact, that "there is no death. The form may fail and wither away, when the soul starts into new life, with mind and memory as when coupled to the body, and ever present the consciousness of the good and evil done in this life. That there is no heaven but conscious right, and no hell but conscious wrong." J. V. W.

[Bro. Webster has also sent us notes of his trip from Creston to Carpinteria, which, as well as his address, will appear next week.—EDS.]

The Stock Yard.

Points of Value in the Devon.

[Written for the Pacific Rural Press.]

The Devons, so tersely styled "The Rubies" —tracing their origin farther back than any well-established breed now in existence—derive their name from the county of Devonshire, where for over 300 years the breed has been kept in its purity, and is, as an English writer recently said, "so near a perfect breed that the introduction of blood from any other breed could not benefit the Devon."

A late president of the New York Agricultural Society and the editor of the "American Shorthorn Herd Book," speaking of Devons, says: "This beautiful race has been considered by some authors aboriginal, and is claimed to have been known in England at the time of its invasion by the Romans. Be the fact of their remote origin as it may, there is no necessity of disputing it or speculating on other probabilities. They are like no others, and by no intermixture of any other known breeds have they been or can they be produced."

Their beauty is summed up in a short extract from the *Rural New Yorker*, which every lover of stock of any breed, that ever saw Devons, must admit to be just and right: "With their bright eyes, uniform color, well-developed milk veins, symmetrical bodies and forms, which are the ideal of perfect animals, produced by *breeding*, not by high feeding."

The Devons are conceded by all writers upon the bovine race to be excelled by none and equaled by few other varieties in point of hardiness—as their wide distribution through every State and Territory of the Union, through British, Central and South America, through Mexico and Japan, adapting themselves to every climate and subsequent conditions, proves. In the columns of every stock journal not devoted exclusively to the booming of some other breed, you find such testimonials as the following: "More profitable for all purposes than any other breed." (L. Fisher, Kansas.) "The Devons are the best cattle for this climate we can obtain." (T. A. Wyatt, Miss.) "The Devons are the coming cattle to put on the range." (Col. Cody—"Buffalo Bill.")

F. Satio, of the Imperial College of Agriculture and Forestry, Tokio, Japan, says: "There are different breeds in Japan imported from Europe and America, but after considering the several conditions here existing, I am in favor of the Devons, as they are hardier than the others, and so I am recommending them to our breeders."—*Amer. Devon Bulletin, Jan. 1, 1890.*

Often you see the expression in treatises on other breeds, "Hardy as a Devon," showing conclusively that it is a high merit to attain and admitted by all to be possessed so thoroughly by the Devon race.

In the roundness and fullness which accompany the proper development of a Devon, the silky, wavy laying of the hair, and the elastic touch of the flesh as the finger is pressed upon it, the beholder will at once see the animal that most surely conveys its likeness to its offspring; also a muscularity and aptitude to fatten that is so characteristic of the breed that we will dispense with the various expressions of breeders and hurry on to tests more recent, showing that Devon breeders are cognizant at least of the value of the "Rubies," and not always wear them with the satisfied expression that their worth will speak for them. But after all has been said and done, the "little Devon," as commonly called, is already found standing by the side of the lordly Shorthorn, contending for highest honors at the recent Smithfield, England, Fat-Stock Show. The three special judges of the award of the champion prizes for best steer or ox were several hours in making their decision, so close was the contest. For the best steer, the Queen's Shorthorn, Mr. Worthley's Devon, Mr. Colman's Red Poll, and Mr. Mann's Aberdeen Angus were the contestants. The two Polls were gradually forsaken, and the struggle for supremacy was between the Shorthorn and the Devon. Ultimately the award was made to the former, the Devon being marked as *reserve.*

Mr. Rose of Lakeville, Cal., says: It is not unusual to see cows weighing from 1600 to 1700 pounds, and bulls weighing from 1700 to 2000 pounds, and that he has raised bulls weighing as high as 2240 pounds at four years of age. Experiments show most conclusively that no stock when crossed with the Devon is diminished in size; rather the reverse, and improved in fattening and many other qualities. Especially the quality of Devon beef in America takes the lead, but few other breeds arriving at that degree of excellence as to be a close imitator in marbling its steaks and roasts.

For instance, I call your attention to the decision given by the three able judges at the Chicago Fat-Stock Show in 1889 of all breeds upon the block, when first prize for three-year-olds was given to the pure-bred Devon steer New Era—an award which was not seriously questioned. In the sweepstakes between the prize carcasses of the three ages competing, the Devons again won (quoting *Breeders' Gazette*), "showing the lordly red, white and roan," the crack Herefords, the far-famed Scotts and all the rest a clean pair of heels at "the death."

In the sweepstakes on the block in 1888, at Chicago, the prize was also awarded to a Hereford-Devon cross.

At England's great cattle show of 1887, the best specimens from *seven hundred* head of all breeds were brought out to be judged by a jury of seven for the great sweepstakes prize of plate, valued at £25, offered by the Queen for the best beast of any breed in the show. The prize was awarded the Devon cow owned by Mr. Skinner.

In the recent test at the Colorado Agricultural Farm of grade steers of Herefords, Galway, Angus and Devon, the Devon took the lead, yielding the largest percentage of dressed meat.

These records place the Devon in the first class for fineness of flesh and delicacy of flavor, while in London it ranks second only to the Highland Scot in point of flavor, and usually bringing a penny per pound over that of other breeds.

In an essay Mr. Hicks says: "It is scarcely worth while for me to state the fact, so generally admitted, that Devons are superior to all other cattle as draught animals, their muscularity, activity and quick motions, and small but hard bone, settles the question; besides, with their beautiful color, graceful carriage and general symmetry, they more nearly resemble a team of thoroughbreds than a yoke of sleepy oxen."

For the dairy, the Devon takes a most satisfactory position as among the best all the year around producers of milk and butter. We give a few of the many 15 to 20 pounds per week cows included in our list, and several of the tests were made on grass alone, without the aid of rich foods so commonly used: Pomeroy's Elith 3d, 1049, made 15½ lbs. in 7 days; King's Beauty, 589, made 19⅔ lbs. in 21 weeks on grass alone; J. Buckingnam, in three months from four cows, made 534 lbs., besides using the cream and milk for a family of seven persons; Dutton's Roxy, 4323, made 15⅝ lbs. in 7 days; Baker's Fancy, 1222, made 408 lbs. in 6 months on grass alone; Mr. Hurlbert's Beauty, 506, averaged 16 lbs. per week for four weeks when she was 14 years old; Fish's Juno, 4302, made 16¾ lbs. in 7 days; Baker's Bright Promise, 724, made 20 5-16 lbs. in 7 days; Mr. A. C. Skinner's Myrtle 7th, 5554, in 1883, after winning first prize as a breeding cow at the Royal Agricultural Show at York, was sent the same year to the London Dairy Show, where in the contest for the best dairy cow exhibited, she took second honors. The London *Field* adds: "The claims of distinction of Myrtle are above the highest of any cow this year of any breed."

Mr. Rose also states: "My dairy averages me 230 pounds of butter each per year, besides using cream and milk for a family never less than eight and some parts of the year as high as 14 persons, the cows feeding upon grass alone and over one-third of the number two-year-old heifers."

Again quoting from Allen: "The Devon may be called medium, in the quantity of milk she yields, and in its *quality, superior.* A gallon of Devon milk yields more butter than that of almost any other breed, as it does now, except the Alderney." He also pronounces the Devon as a race, "when bred with an eye to the development of the dairy quality, *good dairy cows*, both in the quantity of milk they give and its *yield* of butter."

The *Dairy World*, in commenting on the Devon winning in the dairy class in Wisconsin, says: "The breed comes as near the compromise of beef and milk as you can get the bovine race," and those are just the qualities the farmer wants.

In a report of the analysis of Devon milk to the Pennsylvania State Agricultural Society, Prof. Thomas Cochran found that it contained casein, fat and sugar in proportion almost identical with those found in human milk.

Dr. J. Cheston Morris, also a recognized authority on milk analysis, says that Devon milk is better adapted to human wants than any other that is known, and recommends it especially for infants, invalids and family use.

Mr. Rose gives his experience as follows: "Twenty-five years I have been breeding thoroughbred cattle, including Shorthorn, Ayrshire and Devon. The latter I have found to be far more profitable for beef or dairy than either of the others, and for the past 14 years I have bred Devons exclusively, selling steers at three years old, dressed weight, as high as 990 pounds, and two years old 750 pounds, not including hide or tallow, and fatted on grass alone. I prefer the Devons, as they hold their milk longer than any other breed that I have tried, are less liable to disorders of the udder, or diseases of any nature, and are in good condition upon pastures where others but barely live."

With the summing up of these points, we claim for the Devon the fairest representative of a general-purpose animal. In all his points the Devon is the finest formed, most bloodlike and active of cattle. He is to his congeners what the Arabian is to other horses.

A Novel Proposition for the World's Fair.

J. H. Sanders, publisher of the Chicago *Breeders' Gazette*, has written a letter to the World's Fair headquarters relative to a unique and thoroughly original plan for the live-stock exhibit at the exposition. His plan embodies the following features:

There shall be selected and placed on exhibition thoroughly characteristic and fully representative male and female matured specimens of each and every breed of horses, cattle, sheep and swine raised in America; the breeds to be classified and grouped with reference to the special adaptation and uses of each.

The specimens so selected need not necessarily be the best or most expensive that might be found, but in every case must be such as are most thoroughly characteristic of the breed represented. In the selection of these specimens, none but animals bred and raised in the United States should be considered.

The Secretary of Agriculture has assured Mr. Sanders that he feels disposed to adopt this as a part of the plan of the exhibit to be made under the direction of his department. To reap the greatest possible benefit of this part of the exhibit as an attraction to draw the public, Mr. Sanders says invitations should be sent all over the world soliciting foreign countries to furnish representations of breeds not yet introduced into this country.

Simi Notes.

Editors Press:—Threshing is nearly completed in the Big Simi, and it is found that wheat is a somewhat better crop than in 1889, though probably not of so good a quality. Barley is generally light, though some pieces yielded well. However, the better price obtained this year will more than make up the deficiency. Hay was a good crop and of excellent quality. Corn was not extensively planted, but promises a fair yield on ground properly prepared and tilled.

Peach and apricot trees planted in '89 have fruited quite freely, and surprised us all with the excellence as well as the abundance of their yield. Mr. F. G. Howland reports 90 pounds of peaches from one tree (Salway) planted in March, '89. Young trees of nectarines, peaches, prunes, apricots, etc., have also borne heavily at Mr. O. E. Hoar's beautiful little canyon place. Mr. Austin, now resident in Chicago, planted in February an orchard of about 35 acres, which seems to be coming on finely. Mr. Hoar, Mr. Gardner and others have also planted quite largely—all, I believe, with good success.

Our new schoolhouse (cost $2600) is completed, and the first term of school opened. We are not having a boom, but people all seem in good spirits, hopeful for the future, and I think a few years will see our now undeveloped valley well improved and filled with a prosperous population. Seba.

Simi, Ventura Co., Aug. 15, '90.

Items from Carpinteria.

Editors Press:—This is one of the warmest days of the season. Mercury was up a little above 90° before 11 A. M., but has settled down a trifle for the afternoon. If this warm weather lasts long, the beans and corn must suffer somewhat and be lighter in yield.

The fruit harvest is hastening along. Most of the apricots, peaches, prunes and nectarines have been gathered and are now being sent away in the dried product, which brings a good price.

Pears are a very light crop—Winter Nelis a complete failure; Bartletts, very few; more of the Flemish Beauty, but no market here for them.

Natural Gas

Has been found at Summerland, about six miles east of Santa Barbara. The late strike was about 39 feet from surface. It is estimated by some one that more than 30 times as much gas as is consumed in San Francisco is escaping from a nine-inch pipe. We hope it is true and that it can be put to some profitable use to brighten our business prospects which for a time have been so rusty. It is claimed to be the largest flow of gas yet found west of the Mississippi. O. N. Cadwell.

Carpinteria, Cal., Aug. 17, '90.

Passing Fraudulent Scrip.

An old swindling game has been started up again in Washington, and one that is just as liable to be played on Californians. The Spokane Falls *Chronicle* says a fellow was arrested there the other evening for passing a Confederate $5 note to a Chinaman in payment for a laundry bill. When he handed the note to the Chinaman it was folded, so that he observed nothing but the figure five and the color of the bill. Soon afterward, when the celestial offered the bill in payment for a drink, the bartender chanced to notice that it was merely a promise of the Confederate States to pay the bearer $5 after a treaty of peace between said Confederate States and the United States had been ratified.

It subsequently appeared that a number of business men in the city had been defrauded by means of this scrip. The swindlers always passed the bill folded, that the inscription might not be seen.

It was decided in court that the man could only be arraigned on the charge of obtaining goods under false pretenses, as the scrip was not a counterfeit of United States money.

Polled Angus Heifers.—With regard to the Polled Angus stock, which he elsewhere advertises as "For Sale," Dr. G. M. Dixon of Sacramento writes us that they are all smooth, even blacks and remarkably choice, individually and collectively; indeed, he claims that they are "the finest lot of P. A. heifers west of the Mountains."

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR WEEK ENDING AUG. 12, 1890.

434,014.—Mat for Fermenting Vats—C. Bazus, S. F.

434,142.—Conductor's Punch—A. W. Coffin, S. F.

434,251.—Adding Machine—D. L. Craig, Silver King, A. T.

434,131.—Traction Engine—J. B. Harris, Stockton, Cal.

434,417.—Clothes Hook—Chas. Hill, Portland, Ogn.

433,943.—Joints for Suction Pipes, etc.—W. P. Humphreys, S. F.

434,339.—Cartridge Shell Loader—C. A. Hussey, Ft. Bidwell, Cal.

434,064.—Spring Motor—Jno. Isele, San Diego, Cal.

434,134.—Miter Box—A. E. McMillan, Oakland, Cal.

434,352.—Crosscut Saw—W. A. Miller, Wapinitia, Ogn.

434,135.—Rotary Blotter—E. E. Park, S. F.

434,356.—Type Writer Copy-Holder—Pipes & Pernot, Corvallis, Ogn.

434,401.—Nailless Horseshoe—S. Pruden, Los Angeles, Cal.

434,369.—Operating Pumping Engine—J. F. Whiting, Albany, Ogn.

The following brief list by telegraph, for Aug. 19, will appear more complete on receipt of mail advices:

California—Frederick H. B. Babbe, Santa Rosa, portable bedstead; Mora M. Barrett and J. F. Daily, S. F., gas or vapor engine attachment; Isaac K. Clever, Deacwood, hanging-up attachment for stamp batteries; Richard E. Eads, Gerson, and A. J. Eads, Pomona, animal trap; J. Weaton, Placerville, handle for hammers, mallets and other striking tools; Milo P. Holmes, S. F., lifting-jack; Oscar A. Horner, assignor of one-half to R. B. Emerson, Eureka, gun sight; William F. Mitchell, S. F., leaf twiner; Emil F. Moening, S. F., safety device for elevators; William D. Nelson, Traver, slat protector for drapers; George Pardy, deceased, W. Pardy, S. F., executor, riveting machine; Frank Rademacher, assignor of one half to H. H. Leithad, steam condenser and water heater; Josiah H. L. Tuck, S. F. subsoil irrigator and fertilizer; George E. Woodbury, S. F., belt or apron for ore concentrator; Dueber Watch Case Manufacturing Co., Canton, Ill., Cincinnati, O., Newport, Ky., Chicago, Ill., New York, Boston, Mass., and San Francisco, composition watch cases. Oregon—John T. Durkee, Portland, fireproof paint; Peter Wilhelm, Portland, stove lid and center piece and lifter therefor; Thomas C. Wilkins, Independence, harvester. Washington—Charles O. Heacock, Tacoma, tool-box.

Note.—Copies of U. S. and Foreign patents furnished by Dewey & Co., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Spray From Bartlett Springs.

Bartlett Springs are a success.

There are still several hundred visitors tarrying at Bartlett Springs.

Bartlett Springs water has been a success for a quarter of a century.

The new hotel at Bartlett Springs is superior to any other in Lake county.

There are nearly 100 cottages and neat cabins surrounding the hotel at Bartlett Springs.

Capt. Andrew Wolf of Stockton was among the lively guests last week at Bartlett Springs.

A. T. Dewey returned on Monday from one week's visit to Bartlett Springs, Lake county.

Mrs. L. E. McMahan and sons are the owners and successful managers of Bartlett Springs.

The stars appear unusually bright and numerous at Bartlett Springs, owing to the rare purity of the atmosphere.

Mr. and Mrs. Howard Overacker of Centerville have been spending a short and pleasant season at Bartlett Springs.

The little steamer Bartlett affords a delightful passage from Lakeport across Clear Lake on the route to Bartlett Springs.

Important improvements have been made annually at Bartlett Springs during the past few years and more will follow.

Mr. S. H. Rendall of Bonnie Brae and Mrs. Stevens and family are among the Los Angelenos visiting Bartlett Springs.

Morning passengers from S. F. can reach Bartlett Springs in the evening by either Hopland and Lakeport or Sites (Colusa county) routes.

The rare scenery of mountains and lake viewed by passengers from Hopland to Bartlett Springs is seldom surpassed in this or any other country.

Bartlett Springs water is bottled and shipped at the rate of 1500 quarts per day. Arrangements are contemplated for soon doubling that quantity.

A beautiful spring of pure, sweet water is now being conducted to the hotel and grounds at Bartlett Springs in quantity and under sufficient pressure to be used for sprinkling and fire purposes. It is taken, through a tunnel 200 feet in depth, from the mountain-side west of the hotel.

Mrs. Frank Waterhouse of Bolinas Bay has a rare collection of amateur photographs of Yosemite valley and other picturesque portions of California, which it was our pleasure to examine while at Bartlett Springs. Many of her views are perfect gems of artistic photography. We hope to reproduce some of them for our paper.

Pears En Route East.—It is telegraphed from New York that Sgobel & Day, agents of the California Fruit Union, furnish the following for the information of shippers of California fruit: The consignments of pears arriving in ventilated cars are yellow ripe; those arriving in refrigerator cars are greenish.

The Happy Farmer.

At last, at last, the evening shadows fall,
And wearily but happily I hie me home,
While in my heart I hear the call
That bids me from the hillside to the hearthside come.
O parting day, that brings the parted near!
O dusky shade, when higher lights appear!
I welcome thee, with heart and carol free,
I welcome thee, blest hour, when fond hearts welcome me!

How loiteringly the burning day goes by,
How heavily the hours impose their meed of pain!
But comes at length the lenient evening sky,
To bend with rest and coolness o'er the throbbing brain.
O tender eve, that bring'st from toil release!
O holy night, with brooding wings of peace!
I hail thy shade, that homeward beckons me,
I welcome thee, blest hour, when fond hearts welcome me!

—*E. C. L. Brown, in Boston Transcript.*

Off for Slumberland.

Purple waves of evening play
Upon the western shores of day,
While babies sail, so safe and free,
Over the mystic Slumber sea.

Their little boats are cradles light;
The sails are curtains pure and white;
The rudders are sweet lullabies;
The anchors, soft and sleepy sighs.

They're outward bound for S'umberland,
Where shining dreams lie on the sand,
Like whisp'ring shells that murmur low
The pretty fancies babies know.

And there among the dream-shells bright
The little ones will play all night,
Until the sleepy tide turns—then
They'll all come sailing home again!

—*Caroline Evans, in St. Nicholas.*

Fortune.

George Hallowell of Elmsboro' died at the age of 80, worth half a million of dollars. People generally thought he had lived a very long time, but they would not deny the fact that he had improved the time and got together a very respectable fortune.

Early in his young manhood he had married Estelle Cleaves, the daughter of a poor actor; and some incongruity of taste, of temper, nobody knew which—for Hallowell kept his own secrets and death had long since sealed the lips of his wife—had separated them after about ten months of married life.

The wife had gone forth, nobody knew whither, and Hallowell lived on his sour, crusty and monotonous life in the old home where he was born, where before him were born his father and his grandfather.

He never went into society; he received no company; he had no friends, and it was a matter of great wonder to whom he would give his property when he was dead.

And when the announcement came that the old man was gone, everybody pricked up his or her individual ears, and the wonder grew.

Three old servants, nearly as old as himself—a man and two women—had always been with him, and constituted the only family he had.

The old male servant was named Gilbert, and in his hands Mr. Hallowell had left his will.

The funeral was largely attended by the entire neighborhood, and at its close Gilbert requested all those interested to remain and hear the will read. Of course, in a matter like this, everybody was interested, and old Gilbert had a good audience.

Squire Secors read the will. It seemed he had drawn it up a year before for the testator. Divested of its formalities, it bequeathed handsome life annuities to each of the three servants, $10,000 to each of the two churches in the village, $1000 for the support of Jim, a large striped cat which the old man held in high regard, and all the rest of the property—houses, lands, stock and money—was bequeathed, without reserve, to Marian Easterly, the village school-mistress!

The people were all stricken dumb with astonishment, and Miss Easterly was, perhaps, more surprised than any of them. A few words in pencil, in old Hallowell's own handwriting, on the margin of the will, explained his reason for this disposition of his property:

"I have been friends with nobody"—so ran the marginal reference—"and people have looked upon me as long destitute of the attributes of humanity. And it was my own fault. I made no complaint. Only one of my townspeople has seen deep enough beneath the surface to surmise that Old Hallowell might have feelings of his own, and she never passed me by without a kind good day. And once when I passed by her little garden she gave me a bunch of pansies, and I think of her always when I see them. And so, because Marian Easterly has treated me as if I had a soul, I bequeath to her the property which has taken me a lifetime to gather, and may heaven bless her in its possession."

All the villagers were jealous of Miss Easterly, and all thought she had been very well repaid for a few kind words and a bunch of pansies. But there was no chance to dispute Old Hallowell's right to do as he chose with his own, and so the poor school-mistress passed peaceably into possession.

Miss Easterly was an orphan, and twenty-three years of age, tall and fine looking, and with more character than is generally given to one individual. Now that she had the power, she asserted herself grandly.

The Hallowell home place was put under a series of valuable improvements which soon changed its entire aspects. Decaying trees were cut down, fresh young ones were planted, a spacious flower garden, with extensive graperies and green-houses, flourished where had been only a stretch of dismal heath, the stock in the stable was overhauled and great changes made, and Hallowell House was rebuilt and remodeled, until it was the finest residence in the country round.

Miss Easterly kept the old servants, who shortly learned to adore her, but she added new ones to the menage and entertained the visitors who hastened to honor her in gracious and liberal style.

As a matter of course the mistress of Hallowell House was not long wanting for lovers. They came thick and fast—some attracted, perhaps, by her beauty and grace, but most of them keen on the scent after Old Hallowell's gold.

But Marian Easterly had sense as well as good looks, and she was not deceived by their pretensions. She remembered the time when a poor schoolmistress might have sat, evening after evening, at parties and sociables, unnoticed and neglected by any of these obsequious fine gentlemen, who now professed to be deeply in love with her, and she treated them all with a coolness which drove them to the verge of distraction.

She had been just a year mistress of Hallowell, when one day old Gilbert came to her with a troubled face and asked an audience.

She bade him sit down and speak without restraint, but the old man made blundering work of it. Marian had to question and encourage him continually, but at last his story was told. In effect, it was this:

When Estelle Hallowell had died, years and years before, in an obscure southern town, she had left a son—George Hallowell's child—born three months after separation from him. This son had hated his father for the wrong he felt he had inflicted upon Estelle, and had never made himself known to him; and Mr. Hallowell had lived and died unconscious of the fact that he was a father.

This son had died two months previous, leaving one son behind him—George Hallowell's grandson and heir-at-law!

Clement Hallowell—that was the young man's name—was now a clerk in a counting-house, and all unconscious of the fact that by right of kin he was the heir of a millionaire!

These facts old Gilbert had just learned through a friend of Estelle's—an old man who had strolled to the village picking up a living by strumming on an ancient harp and singing a few superannuated ballads. He had been a player in company with Estelle's father, and had always, so to speak, kept on the track of the family.

Some women would have doubted the old stroller's story, but Miss Easterly did not. She saw him herself and got out of him every minute particular.

"I thought it my duty to tell you, ma'am," he said to Marian, "but I'd rather have cut my head off. I said to Polly, said I: 'It seems a wicked, burning shame for to go and disturb the dear young lady's peace now that everything is a flowing on so beautiful.' And said Polly to me: 'Gilbert, always do your duty, man, and you'll be happy.'"

"You did perfectly right to tell me, Gilbert," said Miss Easterly, kindly. "I should have been very sorry if you had not. There has been a great wrong done. Thank heaven it is in my power to right it!"

"What will you do, ma'am?" asked the man, though from his knowledge of Miss Easterly's character it was not difficult for him to guess.

"Never you mind, Gilbert," said she; "I will do what is right."

So she made a confidant of Squire Secors and had him set on foot inquiries relative to young Clement Hallowell. The information which he gathered settled the fact beyond the shadow of a doubt that he was George Hallowell's grandson, and also that he was a young man who had led a noble and irreproachable life, and though very poor he was respected and esteemed by all with whom he came in contact.

Then Miss Easterly caused a conveyance of the Hallowell estate to be drawn up, and by it she gave everything into the possession of the heir-at-law. Her commands that he should come on at once and attend to his inheritance were imperative, but it was some time before Clement Hallowell could be induced to take advantage of his good fortune.

It was not until after Miss Easterly had delivered everything into the hands of Squire Secors, as agent, and had herself left for a distant town, where a school was offered her, that young Mr. Hallowell came down from Boston and took possession of his own.

Shortly after Marian's school began in Westlake she became acquainted with a young gentleman named Burke—a poor artist, handsome and cultivated, but without money, friends or influence.

As a natural consequence they fell in love with each other, and Marian was so happy in her choice that it never occurred to her to lament the splendors she had lost in renouncing the Hallowell inheritance.

Young Burke was very eager for the wedding not to be delayed, and one summer morning they were married quietly in the little church at Westlake, and set out together for her husband's home.

About this time he had never told her anything—neither had she inquired; so you may understand she was deeply in love with him—for now-a-days the "establishment" is of infinitely more consequence to the young lady than the man who goes along with it, by the way of incumbrance.

Marian was a little puzzled by one thing. As she had stood in the church and listened to the solemn words of the marriage service, the name of the bridegroom, though uttered by the clergyman in a very low tone of voice, sounded new and strange to her. She had not understood it; nevertheless it had not sounded like plain John Burke.

Seated in the cars by her husband's side, she asked him about it.

"The name is all right, darling," he replied, squeezing her hand under the folds of her shawl—new husbands will do such foolish things, you know; "don't trouble your head about that."

So Marian dismissed it from her mind.

By-and-by she saw that they were nearing Elmsboro, the town where her fortune had been found and lost. She leaned out of the window to get a look at familiar objects. Her husband bent over her.

"Do you like Elmsboro, dear?"

"Very much. I was very happy here."

"I am glad. It is my home—our home," he said quietly.

Surprise made her silent, and the stopping of the train at the depot prevented further conversation. A handsome carriage and pair awaited them, and in a very brief space of time Marian and her husband were driven to Hallowell House.

And there, drawn up in array on the lawn, were old Gilbert and Polly, and all the rest of them, waiting to welcome back their old mistress.

Marian turned to her husband with a puzzled tone.

"Nothing—except that my whole name is Clement Burke Hallowell, and you are my wife! Pardon my deception, Marian, but I fell in love with you before I saw you. I know that no ordinary woman would have sacrificed what you did for a sense of honor, and I resolved to know you. I felt sure it would not prosper my suit if I was known to you as the heir, so I was a poor artist instead, and darling, I am a poor artist, for I never drew a thing in my life. You know you used to tax me last summer with my miserable laziness, but I was on entirely different business from picture-making. And now say you forgive me!"

She could do no better, she said, seeing as he had already settled everything his own way; and she slid gracefully into her own place as mistress and Hallowell House had all its own again.

Didn't Make it Work.

Many old Oregonians remember Jesse Applegate, "the sage of Yoncalla."

In the early days, just for accommodation, he would provide meals and lodgings for such travelers as chanced to travel his way. It was an annoying custom, with a certain class of stock-dealers who went over the road, to offer a $50 slug in payment for a night's entertainment, and if the change could not be given they would settle in full the next time they stopped.

One day a fellow whom Jesse had spotted offered a slug in the usual way, saying he was sorry, but really that was the smallest coin he had about him.

"I'm sorry, too," replied the host, "for I haven't a bit of change in the house."

"Oh, never mind," replied the guest, "I'll hand it to you as soon as I come back."

"But maybe I'll never see you again," suggested Applegate, ignoring the hand outstretched for the eight-cornered coin.

"Yes, you will. I'll be along here in about a week," said the other.

"Oh, well, in this case I'll just keep the slug, and when you come back I'll have the change for you," replied the old gentleman, and putting the piece in his pocket he bade the stranger good-morning, with best wishes for a prosperous journey and a safe return.

That man didn't try to fool with old man Applegate any more.—*Exchange.*

Bird Songs.—It is proposed that a permanent record be made of the songs of birds by means of the phonograph. "This done," says a correspondent, "the song could be reproduced leisurely and 'scored' by a competent musician. Thus art and nature would go hand in hand."

Letters from My Singular Friend Miss Ransom.

THIRD PAPER.

[Contributed to the Rural Press by L. H. S.]

I read Miss Ransome's last letter, that was so full of education at home, to several of my friends, and it was criticised quite freely.

Papa said that people were a great deal smarter after marriage, and after mature years, and that they could improve their minds and learn a great deal if they were not too lazy.

Cousin James, who was lunching with us, said that if his wife tried to *learn* him grammar after he was married, he would turn her over to the Lunacy Commission.

I retorted that she would come to that anyway, if she tried to teach him anything; and if he had not taken it as a pleasantry, we would have had a serious quarrel.

My brother said that if women had any time for anything but dress, it was news to him.

The girls of our set each had different ideas about it. One said when she married she was determined to have an easy time and not try to do hard and impossible things; another one thought that if people saw room for improvement in each other after marriage, they could not be happy.

Dolly Brown, who used to live in the country, said that women in the country had to work so hard that they were too tired for study even when they had time; and that where there were children and no servants, the mother never had time for anything except to clothe and care for the little ones.

So by getting other people's opinions, I was able to make out a very respectable answer to Emily's letter. I wanted her to think that I was at least capable of thinking about these things. This was Emily's next letter, from which I have eliminated all the personal items:

Lone Tree School District,
Fresno county.

My dear Rose: Your letter started so many ideas to pounding in my brain that I will answer you promptly to get rid of them. Your prevailing idea seems to be that farmers' wives have to work so hard that time for reading or systematic study is quite out of the question. From what I have seen since I came here, I think that the average country women are not so overdone as the women I know in the city. They may actually perform more manual labor, but they are not subject to the same interruptions and do not sustain such complex social duties. With the early hours and isolation, the work in itself is not so much of an obstacle as it seems to an outsider.

What the women do suffer from here is lack of knowledge, lack of scientific information and lack of right methods which I must not stop to dilate upon to-day. Then we must not judge the present by the past of even a few years. They tell me that a few years ago here, everybody staid at home and worked hard and ran down the country; now the same people are driving around the country seeming to have a great deal of leisure, and all sorts of social accomplishments crop out among the men, women and children. Improved methods of cultivation and the maturing fruit trees are responsible for these changes. These things cause the home lives to change somewhat, so that we ought not to lift up "lack of time" as the great impediment to culture, for in a few years there may be a great deal of time. God forbid that any of the little mischief-makers should be taken away, but then they grow up so quickly, and the school-teacher has them all day.

I think the Household columns in our papers are doing a great deal to help and alleviate women's labors. All kinds of hints in regard to domestic toil are generally read and fairly tried. Some of them are of real value, and the farm women, who are so much interested in these things, get the benefit. Women are not putting so much unnecessary time on their work as they used to. Houses are built more conveniently and all the culinary wheels are oiled to make them run as swiftly as possible. It is getting to be the fashion to conquer the housework instead of letting the kitchen manage everything. Add to this the fact that the simplest cooking, these days, is considered the best, and that plain food is coming to the front as the national material of which to make our boys and girls.

I find, too, that you need to cause people to really *desire* to do a certain thing, not to convince them that they are *able* to do it. It is desire that moves the world more than opportunity. My thought on this subject is not how will housekeepers get time for mental culture? but how will they get the aspiration for the wisdom that comes with a closer acquaintance with standard books? I made a little test of this matter the other day. One Friday night I called to my desk the eldest girl in my school and showed her a little work on physical culture that I use for reference. I asked her if she would not like to take it home and read it on Saturday. She glanced it over and laid it down with a sigh, saying that she would have to help her mother and she would have no time to read it.

The next Friday I purposely dropped in her way an old novel by the Duchess I had found at my boarding-place. She came and asked me if she could take it home, and she returned it promptly on Monday, saying it was "splendid." The girl comes to school with her waist

laced a little tighter every day; but I do not despair of some time persuading her to read the work on physical culture.

Anyway, Rose, I am preaching the gospel of try, let success be what it may. Let the housewife introduce the Chautauqua course or some other course of standard reading for herself and husband, and if they fail to pursue it continuously, the books are there, a mine of wealth for the children to inherit, and the strangers within the gates will occasionally pick them up to extract grains of gold.

I am sorrowed not to see people reading standard works, works of history, biology, travel and science. They read newspapers, plenty of them, all about the murder in Pennsylvania and the elopement in Virginia; and mothers think more about what their children wear than what they think and know.

I hope you will not call me singular, dear Rose, because I talk about these practical topics in my every-day letters to you. I get these solid thoughts out here in the profound silences of these great fields, and I must talk them out to somebody.

I once heard of a woman, the wife of a farmer, the mother of two children, who began with the rudiments and gave herself a very visible education, doing all her housework in the meanwhile; but she was led and inspired by a devoted woman friend, who knew how to do good in the world, and who evidently knew the broadest and fairest meaning of the sweet word charity.

As her education progressed, she improved in every way; she became more devoted to her husband and children, and gave more taste to the appointments of her home. The husband, who had been abashed on account of her illiteracy, began to hold up his head among men, and became a social, and later on a financial, factor in the community.

Knowledge is power, if it only inculcates pride and ambition.

Let us encourage every one to think that they can improve intellectually, physically and morally, and let the obstacles take care of themselves.

And so you think, my child, that you would not like to be a farmer's wife, because farmers' wives have to "drudge from morning till night," if it happens that they are too poor to hire help.

In my next I will try to give you my impression of what the farmers' wives do, founded on my observations here.

Suppose you write me what the city wives do, and we can compare notes. I hope you will go to see my mother often, for she is not well.

Write me all the news about the girls of our set.

Always yours affectionately.

EMILY RANSOM.

Pulling the Rabbit Out.

The old doctor and the old captain were fast friends, both inveterate jokers, and both, despite their aggregate six-score years, rabid sportsmen. The doctor's frightful stammer did not seem to impede the flow of a joke, nor did the captain's equatorial girth lessen his agility.

One afternoon the old men set out on a rabbit hunt. As they passed through an orchard, something scurried into a burrow.

"A r-r wist—rabbit!" shouted the doctor. "L-l-let's pull him out;" and kneeling at the hole, he thrust his arm in up to the shoulder. "S-s say!" he remarked after a moment's fumbling, "I c-c—wist—can't q quite g-get him Y-y—uh—you t-try it, John; y-y—uh—your arm's l-longer than m-m—wist—mine."

The captain knelt and thrust his arm down. In an instant he was executing a war-dance around the tree, waving a bloody finger.

"B'ankety-blank-blank! That's no rabbit; it's a ground-hog."

"D-d—wist—did he bite you, J John?" queried the doctor anxiously.

"Bite? Blankety-blank! Don't you see he took off the whole end of my finger?"

"Wh-wh—uh—why, that's t-too b-b—wist—bad," said the doctor, taking his hand from behind him and showing a badly lacerated thumb. "H-he b-b—wist—bit me, too!"—*Ex*

222.—ANAGRAM.

What *totol* is I'll try to show,
Though few will guess it I well know.
To say "*it's logic*" is not right,
It has a different meaning quite;
In mathematics is its place—
An honored one, without disgrace.
As calculation gave it birth,
It ought to have intrinsic worth;
It ranks above a decimal,
Because 'tis "sexagesimal." NELSONIAN.

223.—HISTORICAL TRANSFORMATIONS.

1. Transpose a reformer of the Tudor period into one who puts on.
2. One of the Norman kings into favorite fowl.
3. A son of Noah into part of a net.
4. An island visited by Paul into a certain boy's father.
5. A famous garden into necessity. H. J. A.

224.—SYNCOPATION.

Whole.

I am a parson who controls
A charge, and I am care of souls.
In medicine I do my share,
For I am called hygienic care;
I remedy, and please observe,
That meat and fish I may preserve.

Last.

Some intimation I may show;
I am a hint play-actors know;
Billiard players use my name
When they talk about their game;
I am the tail, and in my list
Of meanings is the one to twist.
NELSONIAN.

225.—CHARADE.

First take a fish, not any kind,
But such as you will likely find
On Scotland's coast in water salt,
Add an infusion sweet of malt;
Beer unfermented you may use
Instead of malt if so you choose.
You need not cook the beer and fish,
Nor will you get a dainty dish.
Instead of food you get, alas!
An herb—a kind of long, thin grass. J. M.

The Latest Cat-astrophy.

[Written for the RURAL PRESS.]

It happened one evening in July in a garden in the "Western Addition." The neighbors' cats had occasionally committed depredations on the back porch, helping themselves to Friskey's allowance of scraps and bones. He was named by a little cousin, and was a handsome cat, almost entirely black. He has now deserted his home, and we do not know whether he has departed for an unknown country or met a sad fate in his wanderings. We now have a new black kitty, which will probably grow to be a sober old mother in time if the youngest hopeful of the family does not smother her in the ash-barrel or choke her to death trying to carry her after the manner of cats. This particular evening baby's brother Allan gave chase to a black and white pussy who was searching for something to devour, and she reached the end of the garden and attempted to climb up the fence, expecting to drop over the other side in safety, but her feet becoming entangled in some strings of brown twine which had been fastened along the fence to train the sweet peas on, she scrambled over with difficulty, carrying the twines with her, and so Allan thought she had a fit and came upstairs to tell papa, and seemed so anxious to have him go and see what was the matter with puss that he consented to go out and investigate the case, and found her suspended on the other side of the fence with the twine wound around her neck. She had actually hung herself! It was a case of *unin*tentional suicide. Such was the sad fate of that puss. Cats, young and old, take warning.

San Francisco.

Little Scotch Granite.

Burt and Johnnie Lee were delighted when their Scotch cousin came to live with them. He was little, but bright and full of fun. He could tell curious things about his home in Scotland and his voyage across the ocean. He was as far advanced in his studies as they were, and the first day he went to school they thought him very good. He wasted no time in play when he should have been studying, and he advanced finely. At night, before close of the school, the teacher called the roll, and the boys began to answer "Ten." When Willie understood that he was to say ten if he had not whispered during the day, he replied, "I have whispered."

"More than once?" asked the teacher.

"Yes, sir," answered Willie.

"As many as ten times?"

"Maybe I have," faltered Willie.

"Then I shall mark you zero," said the teacher sternly; "and that is a great disgrace."

"Why, I did not see you whisper once," said Johnnie that night after school.

"Well, I did," said Willie; "I saw others doing it, and so I asked to borrow a book; then I lent a slate-pencil, and asked a boy for a knife, and did several things. I supposed it was allowed."

"Oh, we all do it," said Burt, reddening. "There isn't any sense in the old rule, and nobody could keep it—nobody does."

"I will, or else I will say I have not," said Willie. "Do you suppose I would tell ten lies in one heap?"

"Oh, we don't call them lies," muttered Johnnie. "There wouldn't be a credit among us at night if we were so strict."

"What of that, if you told the truth?" laughed Willie bravely.

In a short time, the boys all saw how it was with him. He studied hard, played with all his might in playtime; but, according to his account, he lost more credits than any of the rest. After some weeks, the boys answered "nine," "eight," oftener than they used to. Yet the schoolroom seemed to have grown quieter. Sometimes when Willie Grant's mark was even lower than usual, the teacher would smile peculiarly, but said no more of disgrace. Willie never preached to them or told tales; but somehow it made the boys ashamed of themselves just the seeing that this sturdy, blue-eyed boy must tell the truth. It was putting the clean cloth by the half-soiled one, you see; and they felt like cheats and story-tellers. They talked him all over, and loved him, if they did nickname him "Scotch Granite," he was so firm about a promise.

Well, at the close of the term, Willie's name was very low down on the credit list. When it was read, he had hard work not to cry; for he was very sensitive, and he had tried hard to be perfect. But the very last thing that day was a speech by the teacher, who told of once seeing a man muffled up in a cloak. He was passing him without a look, when he was told the man was Gen. ——, the great hero.

"The signs of his rank were hidden, but the hero was there just the same," said the teacher. "And now, boys, you will see what I mean when I give the medal to the most faithful boy—the one really the most conscientiously perfect in his deportment among you. Who shall have it?"

"Little Granite!" shouted the forty boys at once; for the child whose name was so "low" on the credit list had made truth noble in their eyes.—*British Evangelist.*

DOMESTIC ECONOMY

The Art of Frying.

[Written for the RURAL PRESS by CLARA S. BROWN.]

One of the lecturers at the recent Long Beach Chautauqua Assembly was Mrs. Sophie Knight, a teacher of cooking. Her hours were very popular ones with the ladies, to say nothing of the gentlemen who listened with interest to her clear directions for preparing various dishes in the most dainty style. I happened to enter the tabernacle while Mrs. Knight was discoursing upon the art of frying, and will repeat, for the benefit of those who could not hear her, some of the statements made after my entrance, regretting that I missed what preceded them. So much of our food is fried, and fried improperly, even by those who consider themselves good cooks, that the subject of the lecture seems an important one.

Mrs. Knight advocated the use of a frying-kettle instead of the frying-pan, found in every house. It is not possible to fry anything perfectly in the pan, and if two women start the first of the week with the same amount of fat, the one using a frying-kettle will have more left on Saturday night than the one using a frying-pan. The kettles are expensive, ranging in price from $2 75 to $3.50, but they are invaluable for fruit-canning and preserving as well as for frying, and better than any other kettle for soups. "I fail to see," said Mrs. Knight, "why my husband should have improved machinery for his work, and I should not make use of the best inventions for my work. I urge you, ladies, to provide yourselves with plenty of the best cooking utensils; the stores are full of them."

An ordinary granite kettle with a wire basket placed in it makes a fair substitute for the frying kettle. The lard or drippings may be used many times over by clarifying it, and both the dark color and food odor will be removed, so that food of all kinds may be fried in the same fat. After using it, remove it to the back of the range, where it will not boil, but will remain fairly hot. When somewhat cooled, "but not cool by any means," the lecturer stipulated, turn in two or three quarts of boiling water, enough to thoroughly permeate the fat, and let it boil until the fat becomes thoroughly cleansed. The lard will turn white and the impurities will sink to the bottom; when cold, you will have a cake of fat that anything may be cooked in.

The fat must be heated to the proper pitch before anything is fried; it must *smoke*, not merely be at boiling-point, and it is not hot enough until it does smoke. Food placed in the wire basket—as much as will lie on the bottom of the basket, or more in the case of potatoes—will brown quickly and fry thoroughly without being penetrated by a particle of the fat, removing the objection made by many persons to fried viands. The fat should be tried with a small piece of bread; if it crisps and browns quickly, the fat is at the right degree of heat.

There are many things which can be deliciously cooked in this kettle. Apples, quartered and fried, are far superior to those cooked in the old-fashioned way, mussed up in a frying-pan, and worse yet, covered over. Veal cutlets breaded, liver dipped in flour or Indian meal, according to taste; oysters, croquettes, slices of tomato, all dipped in bread or cracker crumbs, preferably in cracker, because that resists fat the best; fish, potatoes, bananas, bacon, tripe dipped in egg batter, hominy, cornmeal mush—in fact, anything fryable that will hold together will come out of this kettle tasting far better than if fried in a pan. The lecturer's fried bacon had won her special praise. This method of frying retains all the juices and produces a delicious crispness.

The speaker digressed a little to discuss the broiling of beefsteak. The very best broiler is the common wire one, because it covers the least of the meat's surface. Where the fire is not suitable for broiling, a smoking hot frying-pan will do; in either case, the secret of cooking a steak well is to sear it quickly on both sides and turn it so often that the juices never have time to rise to the top. The time required is from four to ten minutes, according to the thickness of the steak and the rarity desired.

A steak should never have any kind of fat used upon it but the best butter, and that is hardly necessary, salt and pepper being sufficient to make it palatable. These should never be applied while the steak is cooking, as they extract the juices. In frying, also, the food should be salted immediately after it comes out of the kettle, when the heat will absorb the salt, and not while being cooked.

"You can pound your steak if you wish," said Mrs. Knight. "I am not satisfied that it does any good, but it satisfies the public. I use tough steaks some other way."

If the meat is covered with vinegar it will be made more tender, but some people object to that. It is astonishing how many women do not know how to cook steaks. I have myself seen a highly intelligent lady and an excellent housekeeper, sift pepper and salt all over a fine porterhouse steak, place it in a large frying-pan that had been well greased, and slowly cook it 15 or 20 minutes, *covered* part of the time. It came out more like a boiled than a broiled piece of meat, tasting and looking as a steak should not.

Mrs. Knight told a story of a hotel-keeper who was famous for his fish dinners, and commanded high prices for them. People telegraphed that they were coming and that they wanted some of his "fanned fish." It was his custom to stand over the fish while it was frying (it must have been in a frying-pan) and *fan* it constantly to keep the top of the fish cool while the bottom was cooking, thus preventing the juices from rising. "If you want your fish *very* nice, remember and fan it," she advised.

The frying-kettles are superior to anything else for preserving because the fruit may be placed in the wire basket and dipped into the syrup below it without being broken up at all. Since hearing this lecture, I feel that I shall not know contentment until I have one of the kettles. Why can't the manufacturers be philanthropic enough to make them cheaper?

GRAPE JELLY.—Stem ripe grapes and put in a preserve-kettle, let come to a boil, mash and strain. Put the juice on to boil for 20 minutes, then add three-quarters of a pound of sugar to every pint of juice, skim while boiling, let cook 15 minutes. Green-grape jelly may be made the same way, but will require a pound of sugar to a pint of juice.

The Week.

Agricultural fairs are pursuing an even way, the prices of most articles being well sustained, and the ingathering of some crops proceeding actively. Still, vast quantities of fruit are going East and bringing good prices; the canners and driers are rushing forward, having passed the high point in their season's work, but the prunes, late peaches and grapes will continue the activity for some time. Preparations for planting a vastly increased area of orchard are being made, and the nurserymen are fast booking tree orders.

Political affairs are heated again this week by the assembling of the Democracy at San Jose. As we go to press nominations have not been reached.

The fairs next week will include the displays at Chico, Petaluma and Placerville — all important districts which can show great progress and peerless products. All within reach of these points should make the events occasions both for entertainment and instruction.

Vegetable Fibers.

Shall we ever have the extraction of vegetable fiber by machinery brought to the point of success which will justify a farmer in growing a crop of ramie or other fiber plant? It is interesting to describe how well such plants thrive in this State and what vast sums the civilized world pays the barbaric producer, who works out the product by hand or with rude appliances, and is content with a few cents a day as wages. It is interesting, too, to read of the many fiber extractors and extracting processes which show fine samples and then offer the farmer a machine or a right to use a process for so many hundred or so many thousand dollars. Such offers do not constitute a practicable basis upon which to urge the production of these fibers in this country. The farmer cannot grow a crop of the fiber plant and then assume the labor and expense of manufacturing it into merchantable fiber before he can realize for his labor and the use of his land. To make the enterprise available the capitalist must buy the machines or the processes and carry on the extracting concern, contracting with the farmer to take his crude fiber green or dry at so much per ton, delivered at the factory or put aboard the cars or steamer. Just as soon as the proposition assumes this phase the farmers of the United States, or some of the States, will produce as much ramie or other fiber-yielding plant as can be profitably sold.

These facts must be recited because of the article which we print on page 154 of this issue, calling attention to the New Zealand flax industry and the large purchase of the prepared fiber in the United States. It is needless to send the seed to this country. The plants have been growing in this State for years and have been distributed nearly all over the State by the university. We know from the reports from widely distant experimenters just about in what districts of the State the plant will succeed. The old plants in Berkeley are seeding freely, and thousands of plants can be had by dividing the old clumps. Now, although all these things are so, who can conscientiously advise a farmer to lumber up his land with New Zealand flax, excepting a few plants which will yield him good material for tying vines, plant bundles, etc.? There is a very important step to be put in between the exhortation and the planting of the crop, and that is the work of the manufacturing capitalist who will provide proper machinery and offer the grower so much a pound, bale or ton for his crop as it comes from the field. Will this ever be done?

There is another fiber material which has been paraded for the last score of years as a possible source of great wealth to this State, and that is the wilderness of so-called "wild hemp" on a portion of the Colorado desert. The subject comes forward anew in an article in the Yuma *Sentinel*, from which we quote as follows:

On both sides of the Colorado river, from Yuma nearly to the Gulf of California, the wild hemp grows spontaneously in great abundance. The growth is perfectly wonderful, the stalk reaching a hight of from 20 to 35 feet, but averaging from 12 to 15 feet.

This great fiber product or plant covers an area of not less than 50,000 acres, and the lowest estimate ever made places the annual yield of the clean or prepared fiber at 500 pounds per acre, or 25,000,000 pounds, equal to 12,000 tons, or 1250 carloads of ten tons each.

It is estimated that to cut and prepare this for market will cost three cents per pound, or $750,000. A rate of freight to San Francisco of $7 per ton has been offered. The freight at this rate would amount to $87,500 annually. The harvesting of this amount of hemp would give employment to from 300 to 500 Indians for four or five months each year.

Most of the fiber grows within two to four miles of the Colorado river, although in places it is found back from ten to 20 miles. It is mainly found among the arroyos or natural canals and lower land, which are overflowed or filled with water in the high waters of the Colorado. It can be cut, and the outside or woody matter can be removed by passing it through a brake similar to that used in the manufacture of flax. This can be done on the ground where the hemp grows, and thus save the hauling and freight of the extraneous matter, leaving only the fiber to be packed in bales and shipped.

Using Indian labor, the fiber can be prepared, baled and transported to the Colorado at an expense not to exceed three cents per pound. Even supposing that the freight should reach $10 per ton to San Francisco, this would make the cost of production and delivery 3½ cents per pound.

The lowest price offered for the prepared fiber delivered in San Francisco is five cents per pound, which leaves a profit of $30 per ton, or $375,000 for the crop per year at the lowest estimate of the yield in the poorest years. This offer has been made for the fiber in 10,000 ton lots, by an English company already engaged in the manufacture of rope, cordage-twine, sacks and matting.

A wealthy German, engaged in the same industry, after having experimented with the hemp, made an offer of eight cents per pound in 10,000 ton lots, delivered at the mouth of the Colorado river or in San Francisco, which would leave a profit of $90 per ton, or $1,125,000 per annum. According to these figures, in the good years there would be expended for labor more than $5,000,000, for freight $800,000, with a profit of from $3,750,000 up to $10,000,000 per annum.

This is about the usual wild way in which this fiber industry is generally presented to the public. The tidings comes to the weary mechanic and fills his brains with visions of mechanical triumphs in extraction or to the ears of the poor farmer who longs for some crop which will pay him more money than he can secure by his present rotation. They all discover, after wasting much time and sometimes money as well, that the proposition is not yet upon a working basis, and that the articles are written either to win investment in some land scheme or some process scheme. We believe there will yet be profit in fiber production in this country, but it will not be reached until propositions assume more practicable forms than those in which they now usually appear.

Produce and Silver Prices.

Those who have followed the course of market prices, as given from week to week in our Market Review, have noted the improvement which has visited several important lines of produce, but possibly have not contrasted the figures of to-day with those of a year ago. The following comparative showing, then, will be of interest:

	Aug., 1889	Aug., 1890.
Wheat, buyer season.....	$1 44½ to 1 44½	$1 55 to 1 55½
do spot, shipping.....	1 27½ to 1 33½	1 35 to 1 44½
Barley, buyer season.....	88½	1 40 to 1 41½
do spot, feed.....	62½ @ 75	1 23½ to 1 31½

This shows a notable advance, especially in barley, which has, in the case of spot feed, almost doubled. Wheat has shown an average advance of 10c per ctl., but this is partly offset by the advance in freights, which are 10s to 15s higher than a year ago.

The course of silver since the recent favorable legislation is also of interest as related to produce values. In August, 1889, silver was quotable at 92½c per oz. in New York; now the quotation is $1 19⅞ per oz., an advance of 27⅝c per oz. This means that a miner having an output of 100,000 ozs. would only have received for it last year $92,500, against $119,875 this year, which gives the mine-owners $27,625 more money to spend or loan out. The more money there is, the cheaper the rate of interest and the higher are farm products, and providing the amount of money does not exceed legitimate needs, and has a good basis of value in itself, the more prosperous are our producing interests.

A President for the University.

By the resignation of Hon. Horace Davis, the State University will be without a president on the first of September. We notice that the name of Professor Martin Kellogg has been frequently mentioned in connection with the place, and we desire to say that in our opinion the selection is one eminently fit to be made. Prof. Kellogg has been active in the affairs of the University from its incorporation. He holds as no other man does the loyal esteem and confidence of the alumni and of the friends of the University generally. His long experience has taught him the needs of the institution, and he is thoroughly charged with its spirit. No one can better mark out its immediate future. He is perhaps the better qualified in this direction from the fact that he has passed the last two years in attendance upon European universities and in contact with European educators. Thus he is enabled to bring to the advancement of our Western institution, which he knows and loves so well, the latest results of foreign experience and observation in the line of university progress. Prof. Kellogg, in addition to his ability as an instructor, is a man acquainted with affairs and is skillful in handling men so as to make their best efforts effective for the general purposes involved. For these reasons and many others of like significance, we earnestly advise the election of Prof. Kellogg to the presidency of the University, and sincerely trust that such selection may be made.

American Pork Products in France.

It seems by recently published correspondence that Secretary Blaine and Minister Reid have been busily engaged for the last two years in the attempt, so far vain, to place the American hog upon a fair standing in competition with other hogs for the esteem and patronage of the French people. The French Government excluded the American hog from French circles in 1881 because of alleged sickness of the animal which rendered his flesh unwholesome. American diplomatists succeeded in combating this claim, showed that the American porker was enjoying fairly good health; at least as good as the hogs of other nations, and that his flesh was not only good eating but innocent of dangerous microbes, etc. This claim was approved by the highest health authorities of France, by the French Academy of Medicine itself, and as if to emphasize the inconsistency of the exclusion, the American hog canned, smoked, salted, sausaged and the like was almost smothered with premiums at the recent World's Fair at Paris.

Although these facts have been forcibly urged upon the attention of the French Government by bulky diplomatic correspondence and by the eloquent personal interviews of Minister Reid, the American hog still cannot get his snout through the French fence, while the hogs of all other nations go trooping in by the front gate.

The French Government, having been forced to retire from its claim that the American hog is an unhealthy animal, still maintains its exclusion upon the ground that pending American legislation on the tariff will work unfavorably to French products. In his official correspondence with the French Government, Minister Reid used these words:

The French decree, in spite of argument and remonstrance, in spite even of proof that it does nobody any good, has been tenaciously maintained unchanged for nine years, in spite of demonstrated facts that nothing is thereby gained either for its own consumers or its producers, and the only appreciable effect is to do injustice to a century-old friend and discrimination against that friend in favor of Germany, Italy and England, and after such a record and in advance of the slightest known movement to amend it, how can France have reason to expect, as your Excellency indicates, that its evidence of good-will should now be reciprocated by the United States? He who seeks justice should first do justice.

From our point of view, then, the case stands thus: The French Government has persisted for nine years in an indefensible act, discriminating especially against United States commerce. Meanwhile it complains of new laws by the United States Government far less severe and in no way discriminating against French commerce. Its complaints receive prompt and considerate attention, and the disposition thus shown evokes no recognition.

Now, as heretofore, I make my appeal to French friendliness, French justice, and, may I add, to the enlightened sense of French interests.

All this diplomatic eloquence is a defense of the American hog. A century of history, a world of justice, a cycle of futurity, are invoked to smooth down the rising bristles of this new American national bird. It is a moving thought. Let the youth declaim the burning sentences from the corner-posts of the big corral to the hosts below. Let them understand that they may rise to the giddy hight of the tea-chest among the causes of war. Assure them that the United States proposes to secure justice for the American hog even if the De Lesseps canal has to be stood on end and the French Government impaled upon its vanishing point beneath a burning tropical sun. We are not a nation to be trifled with.

Agricultural Interests in Congress.

In the House of Representatives, on the 19th inst., Cannon of Illinois, from the Committee on Rules, reported a resolution setting apart certain days of this week and next week for the consideration of bills reported from the Committee on Agriculture.

The resolution was adopted, after some discussion, and under its provisions the Senate bill in support of agricultural colleges was at once disposed of satisfactorily—as noted in another paragraph.

The next to be taken up is the bill providing for the inspection of cattle and meats for exportation, which is to be voted upon after two hours' debate. Then the bill defining lard will be taken up and the previous question ordered at 4 o'clock on Saturday. On Tuesday of next week the bill defining options will be taken up and the previous question is to be considered as ordered at 3 o'clock.

Horticultural Use of Copper.

To show how the occupations of different classes are often closely associated to mutual benefit, it may be noted that the consumption of sulphate of copper for the prevention of disease in vines is one of the factors for the increased development of the copper mines of the country. During the last 16 months the famous French syndicate which attempted to corner the copper of the world, and failed, has alone sold 179,000 tons of copper, the value in the meantime advancing $100 per ton, showing that consumers had very short supplies. The large producers also sold all the copper they made. The enormous consumption of copper during this period was largely due to the greatly extended use of copper wire for electrical purposes, and of sulphate of copper for the prevention of disease in vines. As far as can be learned, the manufacture of sulphate of copper will probably absorb 20,000 tons more copper this year than last. This shows an enormously increased demand from the vineyard men of the world which must be met by the miners. Bids for delivery of sulphate of copper for the first six months of next year show an increase of over $5 per ton above present prices.

Petaluma.

The coming week will see Petaluma thronged with people on the occasion of the holding of the Sonoma and Marin District Fair. Petaluma is one of our most enterprising and wide-awake towns, and one of the best situated for growth and progress. The engraving which we give on this page shows the general situation of the town, with its background of low hills and its foreground of moist lands through which a navigable stream gives water transportation to the cities of San Francisco bay and the world's ocean highway. Since our picture was prepared there have been notable improvements in the way of buildings, etc., but the site is of course unchanged in its many advantages, and of these the engraving gives a fair impression.

The Indian Wheat Crop.—Hon. J. R. Dodge, Statistician of the Department of Agriculture, in his August report says that the Government of India has just issued its final report upon the wheat crop of 1889-90. From this it appears that the acreage amounted to 24,983,100 acres, and the product 6,303,900 tons, or 235,345,600 bushels of 60 pounds. The acreage was smaller than for several years, and the crop the smallest reported since statistics of production have been regularly collected.

State Board of Horticulture.

At the meeting of the Executive Committee of the State Board of Horticulture held Aug. 14, 1890, Alexander Craw of Los Angeles was appointed Clerk of the Publishing and Quarantine Bureau. Mr. Craw has accepted the position, for which he is well fitted. Mr. Craw will also act as entomologist to the board. Our readers are already aware that he has for years given particular attention to economic entomology, and during his long foremanship of the Wolfskill orchard did excellent work in this line. We are glad that Mr. Craw will now have an enlarged field of operation.

The State Board Committee ordered the erection of glass houses in which to breed the *Vedalia Cardinalis* (Australian lady-bird) through the winter. These will be built at San Gabriel and at San Jose.

The date for the holding of the convention at Santa Cruz was fixed for Tuesday, November 18th to 21st, inclusive. Mr. Lelong is about to enlarge his offices again to make room for his growing work. He will now have a meeting hall fitted up, to which all meetings of horticulturists will be welcome. This new apartment will be ready about Sept. 10th.

Florida on Wheels.—A dispatch from New York does not give a very high tribute to the rolling exhibit of our sister State, of which it says: Florida's show consists almost entirely of canned goods, supplemented by a live alligator car, and instead of being attended constantly, like the California show, by men competent to advertise the advantages of the State, it is in charge of a colored porter, who hands out printed matter.

Canadian Barley.—Mr. Dodge, in his August report, mentions that nearly the whole Canadian export of barley comes to this country. In 1889 the total export amounted to 9,948,207 bushels, of which this country took 9,934,501, and the proportions are about the same from year to year.

Cyclones.—The conclusions reached by modern meteorologists are that cyclones of great intensity are ascending spiral whirls of wind having a rotary motion in a direction in the northern hemisphere opposite to the movement of the hands of a watch.

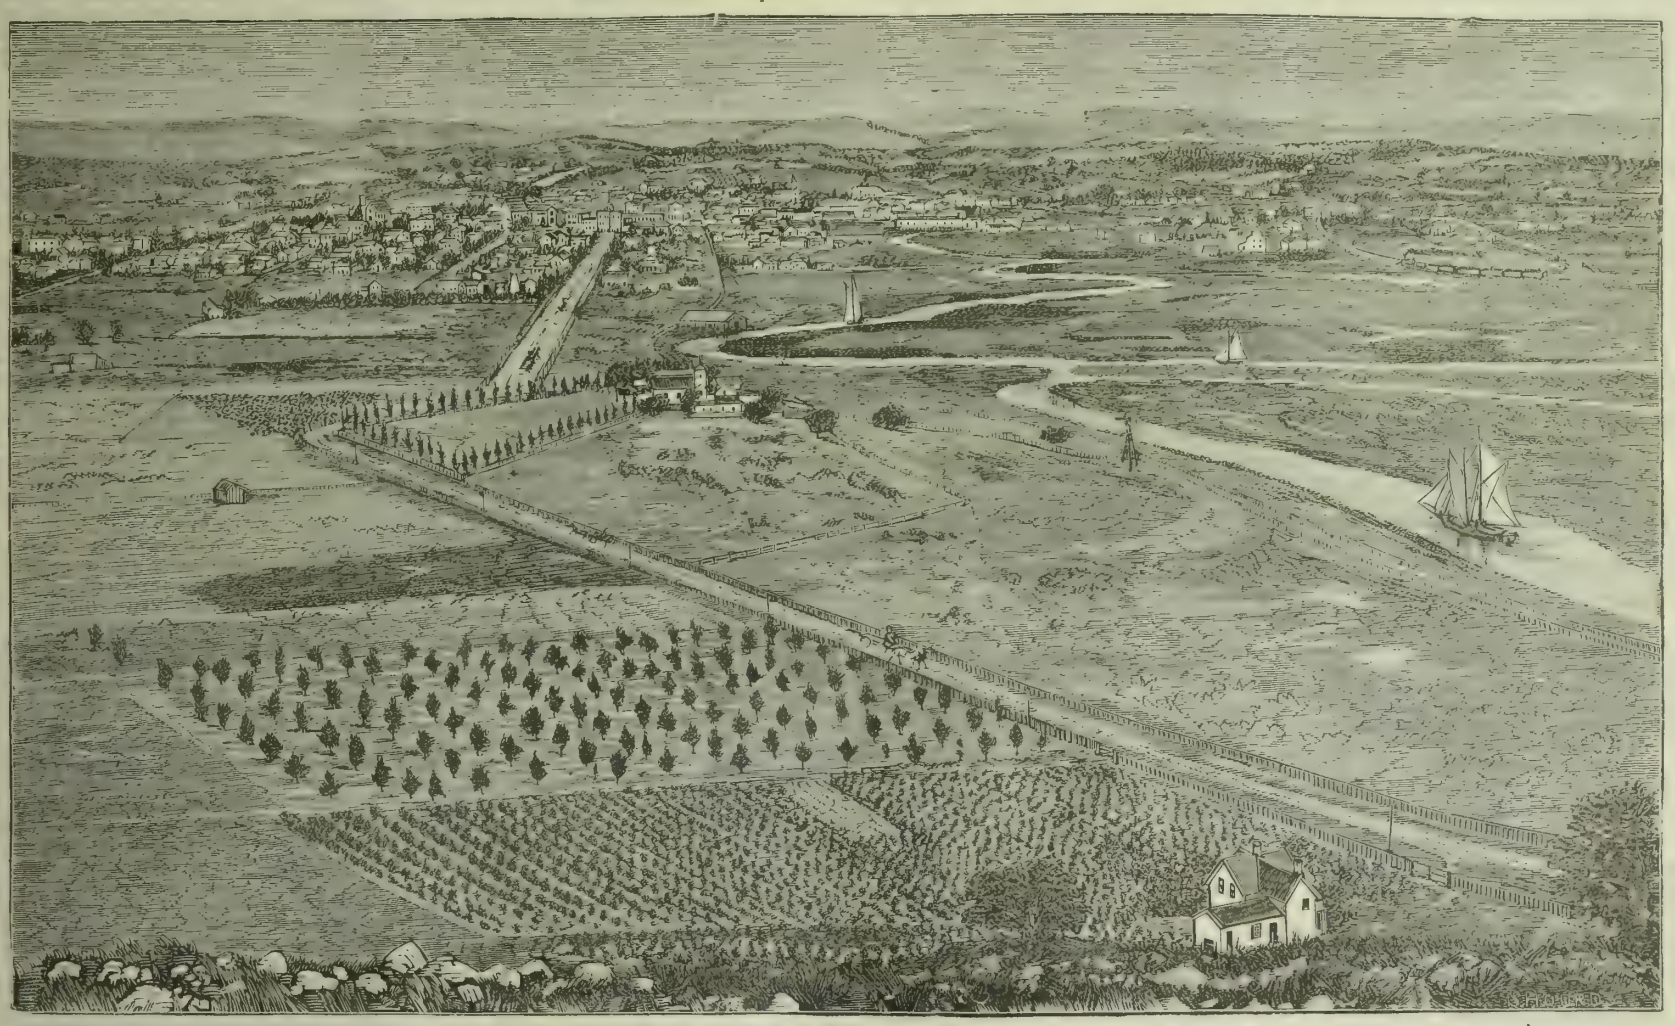
Clover Ensilage at the Oregon Station.

[Written for the Rural Press by Prof. H. T. French.]

The silo on the College farm was partially filled last May with white clover and fine grass cut from the College campus. The grass was allowed to wilt thoroughly before placing in the silo. Some of the material became too dry. To overcome this and cause the material to pack well, we sprinkled each layer as it was put in. Some writers have claimed that water was a positive injury; but I believe it was an advantage in this instance. The grass was put in as it came from the field without cutting with the feed-cutter.

By treading thoroughly as each load was placed in the silo, the whole mass became very compact. After the grass was all in, a small load of green rye was run through the feed-cutter and placed on top. This was covered with loose boards and a few sticks of wood to hold the boards in place. The material on top could not be considered in any sense a weight, as that term is understood in weighting silos. No doubt the ensilage would have done equally well had nothing been placed on the loose covering. The silo was opened about the middle of July, showing only a little waste on top and a trifle in the corners. Even a large portion of that which we considered poor was eagerly devoured by the cows as soon as they discovered it in the yard. The milch cows and calves are fed one ration a day of the ensilage as a supplementary food to that obtained in the pasture.

There is usually a shrinkage in the flow of milk during the dry season; but this is not the case when the cows are supplied with good ensilage. There is even a larger flow of milk than when the pasture was green and good hay was being fed. I do not wish to infer that ensilage will produce a better flow of milk than plenty of good grass in the pasture, but that the flow can be kept up when the pasture fails by using this most excellent food. We are feeding a shorter grain ration than we did before opening the silo. In short the ensilage seems to be a complete substitute for green food.



Clover grows early and can be stored in the silo at a season when other work is not pressing. The clover ensilage can be fed out during the dry season and the silo again filled with green corn for winter use, thus making the feeding cycle complete.

There are many advantages in this system, if successful, the most prominent of which are the manufacture of butter during the two seasons, when prices rule high; and, second, butter can be produced cheaper than on other kinds of food. The benefits do not stop here, for if there are young colts or calves to feed, there is nothing better, during times of extreme drouth or cold, than good ensilage. We have three calves in the barn, one six months old and two four weeks old. All of these are very fond of the ensilage and are doing well on it. The work-horses enjoy it as well and would eat quantities of it if we had it to spare.

We shall enlarge the silo this season, hoping to have storage capacity so that we may have ensilage the year through, if desirable.

Our corn crop will yield a fair amount to the acre this year, yet it was materially injured by the drouth during the forepart of the season.

Corvallis, Ogn.

GENERAL VIEW OF THE TOWN OF PETALUMA, SONOMA COUNTY, CAL.

The Veterinarian.

Horse Cough and Garget.

Editors Press:—Will Dr. Buzard kindly tell me what to do for a valuable horse affected with a cough, accompanied with a sonorous sound in the throat, caused probably by dusty hay? Cause is removed and still the coughing continues violently for weeks.

Also, what will prevent and cure garget in cows? What is milk fever, the symptoms and cure?—R. H. B., *Riverside.*

Editors Press:—Your correspondent's horse is suffering from chronic cough. I do not think the dusty hay has anything to do with it. Apply the following liniment to the throat every two days: Croton oil one-half drachm, glycerine two ounces; also give the following powder night and morning: Pulverized digitalis one drachm; nitrate of potash, two drachms; sulphate of iron one drachm. Keep up this treatment for a week or ten days, then let me know the result.

In answer to his second question I would answer that *Mammitis—Garget*—is inflammation of the udder. This is a frequent disease in the cow. The animal is used as a milk-producing machine, and the lactiferous apparatus is very largely developed. The causes are, exposure to cold when heated, injuries of various kinds, or specific disorders. It is most frequently seen in young cattle and those kept in a plethoric state. The treatment must be constitutional and local. Give a large dose of sulphate of magnesia, and allow the animal to have nitrate of potash in the drinking water. Remove all the milk at regular intervals, either by milking or by the aid of the milk-siphon, or by the calf having free access. Bathe with warm water, then apply a poultice of flax-seed containing belladonna to the whole organ; support the udder by a broad bandage passed over the loins. As soon as an abscess has formed it must be freely opened and dressed with carbolic ointment. If mortification sets in, the animal must be supported by stimulants and tonics, and the dead parts excised, or if they slough, dress with a solution of chloride of lime. If the bag becomes indurated, we must use alkaline injections through the teats, and apply to the udder iodine ointments, and give iodide of potassium internally.

I will treat on parturient apoplexy (milk-fever) next week. A. E. Buzard, M. R. C. V. S. *11 Seventh St., S. F.*

A Waterspout formed on the bay off Escanaba, Mich., one day last week, lasting 15 minutes. It was 200 feet in diameter at its base, extending into the clouds, and made a noise audible at a distance of two miles.

AGRICULTURAL NOTES.

CALIFORNIA.

Alameda.

BARLEY.—Hayward's *Journal*, Aug. 8: It is fortunate for the farmers of Alameda county that with the very short crops, their staple product, viz.: barley, commands such a high figure in the San Francisco market. Alameda county barley is known the world over as marketing the best beer and for that reason the farmers are very foolish to sell even what little they have for the present prices. It is predicted by men competent to judge that barley will be worth at least $1.80 per cental this winter, with the probability that it will reach $2.

CROPS.—*Herald*, Aug. 14: A. Hillebrand raised this year on 32 acres of land just west of this place, 420 sacks of wheat, weighing upward of 60,000 pounds or 30 tons. This is nearly a ton to the acre. William Hanna, who farms on W. J. Fallon's ranch on the Dublin road, just west of this place, had a fine crop of wheat on 120 acres of land this season. The piece yielded 1375 sacks, averaging 164 pounds each. John Galway had a stack of Chevalier barley from 25 acres of land on his ranch on the Dublin road this season, from which was thrashed 876 centals of grain, an average of 35 centals per acre.

Butte.

HARDY FRUIT TREE.—*Register*, Aug. 14: On the old Grant place between Oroville and Wyandotte is a fig tree, broken down so that the top touches the ground, yet resting on the long, stout limbs. Enough of the roots are attached so as to feed the tree. It is now fully 15 years since this tree was irrigated or cultivated. It stands upon a high knoll and in one of the driest spots on the road. We examined the tree this week and found it full of figs. But few trees are more hardy and vigorous than the fig and this one shows they will live under the most adverse circumstances.

Contra Costa.

PINOLE STOCKYARDS.—Martinez *Gazette*, Aug. 13: The work on the Pinole stockyard improvements is going ahead steadily. About 60 men are now employed there, which number will be increased in a few days to 200. There will be four railroad tracks run back as far as may be necessary to accommodate the various branches of business to be conducted there, and four sidings likewise for switching. Instead of a mere cut through a hill for the tracks, the entire hill will be taken away and the material used for filling low ground. The improvements are projected on a very large scale, and an immense business is contemplated.

El Dorado.

FRUIT SHIPMENT.—Placerville *Republican*, Aug. 14: A large number of the fruit-growers of El Dorado county met at Diamond Springs to devise ways and means to profitably dispose of the different varieties of fruit raised in the county, and to select the most desirable location for erecting suitable buildings on the line of the Sacramento & Placerville railroad for the fruit-shipping business.

Fresno.

THE FIRST RAISINS.—Fresno *Republican*, Aug. 14: Schacht, Lemoke & Steiner yesterday shipped three boxes of Muscat raisins as samples of Fresno's crop of 1890. The raisins were grown in light soil in the Church colony. The firm will begin packing raisins in about two weeks. This year's crop will be of better quality than that of last year, owing to the slowness with which the grapes matured.

FIGS.—*Republican*, Aug. 14: Fig-growing is destined to become one of the leading horticultural industries of Fresno county next to the production of raisins. The fig thrives well here and there never has been known such a thing as a diseased fig tree. When properly handled, dried or crystallized, it will be a most profitable crop, and the fig-growers have awakened to the necessity of taking action toward establishing a permanent market for this most wholesome and nourishing of all fruits.

CORRECT.—Selma *Irrigator*, Aug. 14: Geo. Heisinger has bought three times as much fruit as he expected to and is still buying large quantities. The fruit is shipped to Chicago under a Sacramento brand. It is to be hoped that another year will see our fruit go out under a Selma brand. We are not ashamed of our fruit and want the Eastern people to know just where it comes from.

Inyo.

CROPS.—Bishop *Register*, Aug. 14: The yield of small grain throughout this valley was probably never any greater than it is this year, nor the quality any better. The unprecedented damp and wet weather of the past and present week, however, may possibly injure the quality of a small portion of it. The wheat acreage is four times greater than last year, barley about one-fourth less, oats and corn full one-fourth larger. Barring untimely frosts, the yield of corn per acre is sure to be quite up to or above average. Potatoes were never of a finer quality nor of a larger yield per acre; the acreage is about double that of last year. There is also a considerable increase in both the acreage and yield of alfalfa. The yield of fruit, especially of apples and peaches, is much lighter generally than last year.

STOCK DYING.—*Register*, Aug. 14: Horses, jacks, cattle and hogs are dying in considerable numbers down the valley around in the vicinity of Independence. No one is able to say what particular disease it is that carries off any of these animals, further than it appears to be a sort of quinsy that affects the hogs, and a sort of farcy with the others. Death follows in a few hours, sometimes in a few minutes, of the first symptoms.

Kern.

BIG PEACHES.—Bakersfield *Echo*, Aug. 14: The peach crop, which year by year is adding to the notoriety of the Kern delta, is again ripening, and promises to do even more for its owners and the community generally than heretofore. If this season does not place this locality in the very front rank as a peach-growing section, it will be a great surprise to those who have made a careful study of this industry. The variety ripening at this time is the Orange cling. It is yellow in color and of good texture, although not so good a shipper as the George cling, which ripens next month. But for size it may be put against anything in the world. Considerable rivalry exists among the different growers as to which can produce the heaviest peach. Lowell Bros. lead off this year with some specimens weighing 16 ounces avoirdupois each. On Friday evening last Charley Maul came in from his ranch with a small box under his arm. Several of them weighed 20 ounces each, and one tipped the beam at 23 ounces. Mr. Maul's orchard is about two miles from Bakersfield and the trees are about five years old.

Lake.

CROPS.—Lower Lake *Press*, Aug. 16: The crops generally turn out better than expected. Hop picking will begin in about two weeks; the prospects are good. The corn crops never looked better.

Los Angeles.

GRAPES.—Pomona *Progress*, Aug 14: In about three weeks the picking of the crop will begin. No one can estimate the extent of the grapes of the valley, because of the heavy bearing. Cook & Langley have already contracted for over 1300 tons of wine grapes. To prepare these for market, over 200 men and boys will be employed for not less than two months, and for a third of the time, about 300 hands will be employed. The grapes will be dried in the vineyards where they are picked, but at the last of the season, if there are early rains, the fruit will be taken to the evaporator at the cannery.

Napa.

FRUIT NOTES.—*Register*, Aug. 15: The French prune is about ready to be picked. The yield is this year not quite up to the average. Many orchardists lost fruit trees this season, due to the excessive moisture of last winter. Perhaps more peach trees suffered than any other variety. The peach crop is this year light, the fruit is small, and in some cases wormy. The yield of apples is not up to the average either in quantity or quality. The fruit is, generally speaking, quite wormy. The pear crop is in many orchards a total failure, and with all growers is small. The fruit set well but has since dropped off alarmingly. The plum crop is also rather short. Of grapes, taking an average throughout the valley, perhaps a two-thirds crop may be looked for. Prices are expected to be a little better than during the past two years. Sun-dried peaches, unpeeled, now command 20 cents per pound. This figure some of our orchardists are now receiving for a good article. All varieties of fruit are marked up, and as a matter of course fruit-growers are jubilant. One orchardist near town, who has about 70 acres in various fruits, will clear about $6000 this year.

DRIED GRAPES.—St. Helena *Star*, Aug. 15: We understand that there are San Francisco parties furnishing the prepared paper for drying grapes on at four cents per pound, which makes the cost of that article for vineyardists only 30 cents for the taking care of a ton. The same parties will contract for the grapes, when dried, at from $75 to $80 per ton. As it is estimated to take only 3½ pounds fresh to make one pound dry, the profit can be easily figured out.

San Benito.

IRRIGATION.—Hollister *Free Press*, Aug. 15: In a few days water will be flowing through the canal of the San Benito Irrigation Co., and thousands of acres of land will be so situated as to be able to be flooded with plenty of water. Land, which until now has only raised hay or grain, and that during "dry years" very sparingly, will be able to produce plentiful crops of alfalfa, vegetables, small fruits, etc., and farmers who have considered themselves fortunate in clearing $10 or $15 an acre yearly from their land will be placed in a condition which will enable them to produce crops which will yield them a handsome profit.

San Diego.

IRRIGATION BONDS.—*San Diegan*, Aug. 11: At the election held in Escondido to decide the question of issuing $450,000 in bonds with which to construct an irrigation system and develop a water supply, the bonds were carried by a vote of 130 to 23.

GOOD PROFIT.—San Jacinto *Register*, Aug. 14: E. Mead, Jr., sowed this year 500 acres to wheat and barley. This was put in with a six-horse team and a four-gang plow. He did all his own work. The entire crop brought $4000. The expenses amounted to $1500, leaving the nice little sum of $2500 net. This was Mr. Mead's first year of farming in California.

HAY.—S. D. *Sun*, Aug. 13: The movement of alfalfa from San Pasqual to San Diego goes steadily on; a constant stream of loaded wagons is going in, yet the demand keeps pace with the supply. The price is stiffening a little lately, and probably $14 or $15 can be had before the season ends.

San Joaquin.

PEACHES—TOMATOES.—Stockton *Independent*, Aug. 16: Joseph Hale of Roberts island is shipping to Chicago several hundred boxes of mammoth peaches of the Crawford and Clingstone varieties. Both for size and flavor these peaches are unexcelled. Ordinarily the fruit is shipped in boxes 4½ inches deep, but this year Mr. Hale is compelled to use boxes six inches in depth. How large the fruit is may be gauged from this fact: The six-inch box admits of only two layers of the fruit in depth and three layers in width fill the box. Mr. Hale next season intends to put out 30 acres more of peach trees....Mr. Hale raises tomatoes, and from two acres he states that he will reap a harvest that will yield him $500. His sales of tomatoes one day amounted to $100, another day $35 35, and a third day $52. The vines will continue to bear until nipped by the frost.

San Luis Obispo.

PAWPAW TREES.—San Miguel *Courier*, Aug. 14: Some time since, Mrs. Nancy Traver of Adelaide sent to Indiana for some trees and shrubs. She received 44 pawpaw trees, some dates and other trees and some shrubs, which are doing well and making a good growth.

Santa Clara.

SUGAR BEETS.—Gilroy *Advocate*, Aug. 16: The beet crop on the Moro Cojo ranch, as in this valley, has vastly improved in the past two or three weeks, and the company now feels confident that the beet yield of the ranch will exceed the estimates that have been given.

Solano.

THE WHEAT CROP.—Dixon *Tribune*, Aug. 16: From information gleaned from the owners of warehouses, we are able to form some estimate of the wheat crop of northern Solano. The season is about closed at Tremont, and Judge Dosk estimates that the amount of grain stored in the warehouses and piled in the yards is not more than one-third the crop of last year. At Batavia, wheat is still coming in from the McMahan and McCune & Garnett farms, and G. M. Coulter estimates that there will be half as much stored this year as last. George Ulsteen, who has charge of all the Dixon warehouses, says the crop of this year is about half as large as that of last year.

FARMERS FERTILIZING.—Vacaville *Reporter*, Aug. 14: The farmers are acting wisely in their efforts to improve their soil. There is increased interest in this work this year. They have cleaned out their corrals and barn lots and scattered the manure in their orchards and on their fields. They have visited the livery stables and private stables in town, and cleaned them up and hauled many wagon-loads out on their ranches. The soil will soon be exhausted without this replenishing process.

Sonoma

HOP TARE.—*Democrat*, Aug. 16: The Sonoma County Hop-Growers' Association adopted the following: That the members of the Sonoma County Hop-Growers' Association fully indorse the new tare established and adopted by the State Hop Growers' Association, and that we will not, from and after the passage of this resolution, sell or contract any hops only under the tare of 3½ pounds per bale. That any member violating the new tare rule shall be subject to a fine of $100 and expulsion from the association.

HOPS.—*Dispatch & Democrat*, Aug. 15: Judge McGarvey sold 60 bales of hops last Monday for 20 cents a pound. D. Pitner also sold 60 bales at the same time for 20 cents a pound.

FRUIT SALES.—*Dispatch & Democrat*, Aug. 15: Last Monday Judge McGarvey sold to the Star Dried Fruit Co. of Healdsburg the entire crop of prunes in his orchard for 2½ cents a pound, delivered on board the cars at Ukiah. J. H. Donohoe sold the fruit crop in the Wagonseller orchard. Wm. Van Allen of Healdsburg purchased the Bartlett pears at $45 a ton for first-class and $30 a ton for second class; the prunes at $40 a ton, choice plums at $20 a ton, and mixed plums at $10 a ton, delivered at Healdsburg, purchaser to furnish the boxes. T. S. Merchant of the Magnolia cannery, Healdsburg, purchased the mixed pears at $16 a ton. We understand that Dr. King was offered a good price for the fruit in his orchard across the river. It is principally prunes, and he intends to dry them himself.

ENCOURAGING.—S. R. *Republican*, Aug. 14: The fruit crop, though not so large as in seasons past, is more than half a crop. The prices now being realized more than compensate for the deficiency in quantity. Grapes promise well and without any unforeseen drawback will turn out as good if not a better crop than last year. Grape-men are confident that a better price will be obtained than last year; some are of the opinion that as high as $15 per ton will be paid ere the crop is fully disposed of. The hop crop is fully up to the best expectation, and like the fruit crop, the price is largely in excess of that obtained for last year's product. The lateness of the season prevented many from sowing grain, yet there has been considerable grain and hay harvested in the county. While money has been close among the farmers for some time, the indications from the causes above stated are very promising for easier times in that respect for the next few months. Many of the wine-cellars are empty or nearly so, the product of former years having been shipped to market. This will cause a more than usual demand for wine grapes.

HOP PRICES.—Healdsburg *Enterprise*, Aug. 16: Twenty-two cents per pound has been offered for 1890 hops grown in this locality. The price will probably run to 25 cents.

Sutter.

LEVEE WORK.—Y. C. *Farmer*, Aug. 15: The work of repairing the levees in District No. 70 will begin in a few weeks and will be pushed as rapidly as possible. As the work will be done by the residents of the district, and they expect to all work together, it will take about six weeks to finish filling in the various breaks and otherwise repairing and raising the levees. About 50 four-horse Stockton scrapers, 20 wheel scrapers and some smaller scrapers have been ordered, and every convenience secured for those who will do the work. The directors are talking of getting a patent grader or ditcher to be used in raising the back levee. On this machine the dirt is taken direct from the plows on a carrier to the levee.

Tehama.

NO EXHIBIT.—Red Bluff *People's Cause*, Aug. 16: The Directors of the Agricultural Association have decided not to have a pavilion exhibit during the fair. There has been so much work in connection with the race-track that the directors have not had time to gather such an exhibit as is desired—one that will be of lasting benefit to the county—and will wait till next year, when the association will be in condition to devote time and money toward this important adjunct, without which no country fair can be wholly successful.

Ventura.

RETURNS FROM APRICOTS.—EDITORS PRESS: Mr. Sexton harvested, weighed and sold 61 tons Royal apricots from 290 trees for $1525—a shade over $500 per acre—and as with all orchards here, much of the crop wasted.—A. D. BARNARD, *Ventura, Aug. 9, '90.*

BEAN CROP.—*Free Press*, Aug. 16: A gentleman, well posted in such matters, and a conservative man, yesterday estimated that there would be shipped from Ventura county this season, 900 carloads of beans. The estimate was based on a yield of 1000 pounds of beans to the acre, the acreage planted being 18 000 (this is 624 acres less than is given in the Assessor's agricultural report for the year). If the estimate of the yield to the acre be correct, the crop will be 9000 tons. A few lots have been sold at less than 3½ cents per pound, but the bulk of the crop will be sold at higher rates.

Yolo.

LARGE DRIER.—Woodland *Mail*, Aug. 14: D. A. Jackson has begun the erection of a first-class drier on his property east of Woodland. Mr. Jackson has his own crop of grapes and has purchased largely of others, and is determined that he will not risk his grapes to such a misfortune as occurred last fall when the early rains destroyed the splendid second crop and brought disaster on grape-growers. Mr. Jackson has under way a drier of quite large dimensions, 55x57 feet. It will be constructed on the plan of the driers on the Byron Jackson vineyard with important improvements.

HOPS.—Woodland *Four Corners*, Aug. 16: The first car of Pacific Coast hops was shipped from M. H. Durst's hophouse yesterday, consigned to New York through Horst Bros. A special engine took the car from here to make connections at Lathrop with the overland passenger train. This car will go through on mail time, and will be the first car of new hops to reach the Atlantic seaboard.

SMALL FRUIT FARMS.—Woodland *Mail*, Aug. 16: There has been a good inquiry during the past few days for 10 and 20 acre tracts for planting to fruit and vines. From the present indications there will be more land planted to fruit this year than ever before.

Yuba.

PUMP IRRIGATION.—Marysville *Appeal*, Aug. 15: Mr. Peacock says that the irrigation plant on his tract at Colmena is working perfectly. He uses a naphtha or kerosene engine for pumping purposes. His berry vines have made a splendid growth under the influence of the water, and have been highly productive this season. Wherever a good supply of water can be struck, and will rise in a well to within 20 or 30 feet of the surface, as at Colmena, the success of irrigation by pumping is assured. Water can be had in this way at a small cost, and is completely under the control of the owner of the land, with no chance of dispute over water rights or failure of supply; nor does he have to take any chances of excessive charges for use of water.

NEVADA.

LAST WINTER'S STOCK LOSSES.—Carson *Cor. Chronicle*, Aug. 16: T. B. Rickey says: I have been riding since June 15th over the ranges and we have lost 30,000 head of cattle in Humboldt county. In one ravine I saw heaps of cattle for three miles, and they were piled up as many as 300 to 400 in a bunch. A herd which sought shelter from a storm were covered with snow and died. Another herd went in on top of them, dying as the snow sifted over them. They must have trampled each other under foot, for the bones of many of them were broken. The sun has dried out the top, but the effluvia from those underneath is sickening. Everywhere you go you find the same state of affairs. No one escaped except those who had stock in the western and southern parts of the State.

Track and Farm.

The State Fair Races.

The State Board of Agriculture met Thursday, August 6th, to make preliminary arrangements for the State Fair, which begins on September 8th and continues two weeks. The entries were opened, and it was found that all the events had filled except two, and for one of these a free-for-all race was substituted. The entries indicate that the races—which begin on Thursday, September 11th—will be equal to anything ever seen at the State Fair. The entries are as follows:

First Day—Thursday, September 11th

No. 1. Trotting (The Occident Stake)—A trotting stake for foals of 1887. Entries closed January 1, 1888. Entrance, $100, of which $10 must accompany nomination; $15 to be paid January 1, 1889; $25 January 1, 1890, and $50 thirty days before the race. The Occident Gold Cup, of the value of $400, to be added by the society. First colt, cup and six-tenths; second colt, three-tenths; and third colt, one-tenth of stake. Five to enter, three to start; otherwise National Trotting Association rules. Mile heats, three in five, to harness. Closed in 1888 with 53 nominations. Value of stake January 1, 1890, $1835.

The following have made third payments:

1. Palo Alto Stock Farm, b f Wild May, by Electioneer, dam May by Wildidle.
2. Palo Alto Stock Farm, b f Coval, by Electioneer, dam Columbine by A. W. Richmond.
3. Palo Alto Stock Farm, br f Clarion, by Ansel, dam Consolation by Dictator.
4. Palo Alto Stock Farm, ch c Norris, by Ansel, dam Norma by Alexander's Norman.
5. Palo Alto Stock Farm, b f Wildmont, by Piedmont, dam Wildflower by Electioneer.
6. Jos. Cairn Simpson, b f A., by Antevolo, dam Lady Del Sur by Del Sur.
7. B. E. Harris, br or blk f Lorena, by Jim Mulvaney, dam Elmorene by Elmo.
8. Lot D. Slocum, b f Moss Rose, by Anteeo, dam Luella by Nutwood.
9. H. H. Helman, gr g Richmond Chief, by Monroe Chief, dam Eta by A. W. Richmond.
10. G. Valensin, blk f Fleet, by Sydney, dam Flight by Buccaneer.
11. P. Fitzgerald, br c Kill Ross, by Killarney, dam by Cal. Dexter.

No. 2.—Trotting—Purse $1200; 2:22 class.

1. J. L. McCord, ch m Mary Lou, by Tom Benton, dam Brown Jennie by Dave Hill Jr.
2. La Siesta Ranch, b m Wanda, by Eros, dam Accident by Elmo.
3. San Mateo Stock Farm, b m Sister V., by Sydney, dam Nettie Lambert by John Nelson.
4. G. A. Doherty, br s Victor, by Echo, dam by Woodburn.

No. 3.—Pacing—Purse, $800; 2:30 class.

1. C. W. Godard, ch Pinto g C. W. G., by Adonis, dam inbred to St. Clair.
2. John Garrity, ch g Hummer, by Sidney, dam Humming Bird.
3. Napa Stock Farm, b g Gold Medal, by Nephew, dam unknown.
4. H. Willis, b g Our Dick, by Gibraltar, dam Mattie W.
5. S. C. Tryon, blk s Costillo, by Echo, dam Bessie Turner by Fred Low.
6. John Patterson, blk m Princess Alice, by Dexter Prince, dam Mollie by General McClellan.
7. Owen Bros., ch g T. B., by Juanito, dam unknown.
8. San Mateo Stock Farm, ch h Rupee, by Guy Wilkes, dam Sible Hayward by Poscora Hayward.
9. J. G Moran, b g McGinty, by Daniel Lambert, dam by Davy Crockett.

Second Day—Friday, September 12th.

No. 4.—Running. Opening scramble for two-year-olds. A sweepstake of $25 each; $25 forfeit, or only $10 if declared on or before September 1st; with $350 added, of which $50 to second. Winners at this distance in 1890 once to carry three pounds; twice, five pounds extra. Maidens allowed five pounds. Three-quarters of a mile.

1. Palo Alto Stock Farm, b c Nero, by Flood, dam imp. Queen Bess by Strathconan.
2. Palo Alto Stock Farm, ch f Rosebud, by Wildidle, dam imp. Rosette by Struan.
3. Undine Stables, Quena, by Kyrle Daly, dam Rachel.
4. H. I. Thornton, br f Bessie Barnes, by Darebin, dam Carrie C.
5. H. I. Thornton, ch g Arcade, by Milner, dam Nannie Hubbard by Hubbard.
6. L. U. Shippee, b c Lodowic, by Longfellow, dam Carrie Phillips, by Pat Malloy.
7. L. U. Shippee, b f May H., by Falsetto, dam Glenluine by Glenelg.
8. L. U. Shippee, b f False Queen, by Falsetto, dam Queen Victoria by Lexington.
9. William H. Frye, b f Lady Franklin, by Joe Hooker, dam by Odd Fellow.
10. M. T. Walters, b c Altus, by Billy Bolinger, dam Della Walker.
11. Dennison Bros., ch f Minnie B., by Prince of Norfolk, dam Lizzie Idle.
12. John Reavey, ch c by Joe Hooker, dam Lady Stacy.
13. O. Harrison, b c Hy Lo, by Cyrus, dam Katharine.
14. Elmwood Stables, b c Duke of Milpitas, by Duke of Norfolk, dam Gypsy.
15. Owen Bros., b s Hero, by Wildidle, dam Precious by Lever.
16. W. M. Murry, blk c Power, by Powhattan, dam Lawn Tennis.
17. W. M. Murry, b c Aristocrat, by Flood, dam Cuba.
18. L. J. Rose, b f Fairy, by Argyle, dam imp. Fairy Rose by Kisber.
19. L. J. Rose, b h Conrad, by Flood, dam imp. Goula by Exminster.

No. 5.—Running — The California Breeders' Stake—A sweepstake for three-year-olds (foals of 1887); $100 each, h f, or only $10 if declared January 1st; $15 May 1st; or $25 August 1, 1890; declaration void unless accompanied by the money; with $600 added; of which $150 to second; $100 to third. Winner of any stake race in 1890 of the value of $1000 to carry five pounds; of two or more, ten pounds extra. Maidens allowed five pounds. One mile and a quarter. Closed in 1888 with 39 nominations.

No. 6.—Running—The Rosemeade Handicap, for all ages; of $50 each, h f; $15 declaration; with $400 added; second to receive $100, and third $50 for the stakes. Weights announced by 10 A. M., and declarations due by 6 P. M. September 11th. One mile and one-eighth.

1. Palo Alto Stock Farm, b c (5) Peel, by Monday, dam Precious by Lever.
2. Palo Alto Stock Farm, ch f (3) Muta, by Wildidle, dam imp. Mutiny by Adventurer.
3. Undine Stables, ch g (5) Tycoon, by Reveille, dam Margery by Error.
4. P. Siebenthaler, ch c (3) Sheridan, by Young Bazaar, dam Lost Girl by Leinster.
5. H. I. Thornton, br m (6) Abi, by Red Boy, dam Abi by Woodburn.
6. L. U. Shippee, br m (4) Picnic, by imp. Mr. Pickwick, dam Countess by Theobald.
7. Charles Kerr, ch s (5) Jackson, by Luke Blackburn, dam Ivy Leaf.
8. J. J. Dolan, b g (4) Revolver, by Joe Daniels, dam by Partisan.
9. Captain A. B. Anderson, ch s (4) Four Aces, by Hock Hocking, dam Maid of the Mist.
10. Santa Barbara Stables, b s (4) Othello, by Hock Hocking, dam Sunday.
11. Elmwood Stables, b g (5) Nabeau, by Nathan Coombs, dam Beauty.
12. W. L. Appleby ch m (5) Carmen, by Wildidle, dam Nettie Brown.
13. W. L. Appleby, b m (3) Raindrop, by Wildidle, dam imp. Teardrop.
14. Wesley George. b g (7) Applause, by Three Cheers, dam Alice N.
15. O. Appleby, br m (4) Alfarata, by Wildidle, dam Monday Filly.
16. Matt. Storn, ch m (4) Lurline, by Longfield, dam Katy Pease by Planet.
17. Matt. Storn, ch m (4) Marigold, by Milner, dam Katy Pease by Planet.
18. N. A. Covarrubias, b s (4) Dan M. Murphy, by imp. Speculator, dam Leona

No. 7.—Running—Selling purse, $300, of which $50 to second; for all ages; horses entered to be sold for $1500 to carry rule weights; two pounds allowed for each $100 less, down to $1000; then one pound for each $100 less, down to $500. Horses entered not to be sold to carry five pounds above the scale. Valuation to be placed on starters only by 6 P. M. the day preceding the race. Mile heats.

1. M. T. Walters, b g (4) Albatross, by Pill Box, dam Della Walker.
2. Dennison Bros., b g (a) Dave Douglas, by Leinster, dam Lilly Simpson by Newry.
3. H. D. Miller ch m (a) Ida Glenn, by Glen Ellen, dam Queen.
4. J. N. Van Winkle, b g Silverbow, by imp. Fechter, dam Belle of the Mead.
5. Albert Hiller, b g (3) Achilles, by Norfolk, dam Thetis by Ten Broeck.
6. Elmwood Stables, br m (4) Installation, by Inauguration, dam Brown Maria.
7. W. L. Appleby, b g (4) Wild Oats, by Wildidle, dam Mary Givens by Owen Dale.
8. Wesley George, b g (a) Applause, by Three Cheers, dam Alice N by Norfolk.
9. Matt. Storn, ch s (3) Larghetta, by Jils Johnson, dam Leveret by Lever.
10. C. Holloway, ch g (5) Forester, by Joe Hooker, dam Mattie C. by Specter.
11. L. J. Rose, s g (a) Mikado, by Shiloh, dam Margery by Error.

Third Day—Saturday, September 13th.

No. 8.—Trotting, Two-year-old stake—Entrance, $50, of which $10 must accompany nomination; $15 payable July 1st, and remaining $25 August 10, 1890; $300 added by the society. Closed March 15, 1890, with 14 nominations. Mile heats.

The following have made second payments:

1. San Mateo Stock Farm, ch f Vida Wilkes, by Guy Wilkes, dam Vixen by Nutwood.
2. Souther Stock Farm, b c El Benton, by Electioneer, dam Nellie Benton by Gen. Benton.
3. Souther Stock Farm, blk c Jim Sinfoot, by Figaro, dam Fanny Sinfoot by Irwin Davis.
4. Palo Alto Stock Farm, br c Almoneer, by Alban, dam America by Hambletonian 10.
5. Palo Alto Stock Farm, b f Elleneer, by Electioneer, dam Lady Ellen.
6. B. E. Harris, ch f Starlight, by Dawn, dam Lena Bowles by Ethan Allen.

No. 9. (Failed to fill.)

No. 10.—Trotting—Trotting purse, $1000; 2:30 class.

1. Palo Alto Stock Farm. rn m Hilliard, by General Benton, dam Daisy Miller by Electioneer.
2. Phillips Bros., b g Prince B., by Brilliant, dam Maud,
3. T. E. Keating, ch g Frank M., by Priam, dam by General Bena.
4. Matt. Earp, b g Jim Leach, by Inca, dam by Sacramento.
5. B. C. Holly, br m Flora G., by Altoona, dam by Conway's Patchen.
6. George Theuerkauf, ch g Lee, by General Lee, dam by George M. Patchen.
7. L. U. Shippee, b h Moses S., by Hawthorne, dam by McCracken's Black Hawk.
8. San Miguel Stock Farm, br h Balkan, by Mambrino Wilkes, dam Fanny Fern.
9. DeTurk & McGraw, blk s Silas Skinner, by Aleona, dam Fontana by Almont.
10. H. I. Thornton, b s James Madison, by Anteeo, dam Lady Patchen.
11. Hermit Stable, g s Larco, by A. W. Richmond, dam Maud Smith by Overland.
12. Owen Bros., g g Bar Barbara, by Len Rose, dam Barbara.
13. J. C. Moran, b g Wallie, by Geo. Wilkes, dam by Mambrino Patchen.

Fourth Day—Monday, September 15th.

No. 11.—Running—The Daisy D. Stake for all ages; of $50 each, h f, or only $15 if declared on or before Sept. 1st; with $350 added; of which $75 to second; third to save stake. Maidens, if three years old, allowed five pounds; if four or more, seven pounds. Three-quarters of a mile.

1. Undine Stables, ch f (3) Retta B., by Joe Hooker, dam Kate Carson by Joe Daniels.
2. P. Siebenthaler, ch c (3) King Hooker, by Joe Hooker, dam Violet by Leinster.
3. H. I. Thornton, br m (a) Abi, by Red Boy, dam Abi by Woodburn.
4. L. U. Shippee, br m (4) Picnic, by imp. Mr. Pickwick, dam Countess by Theobald.
5. Dennison Bros., ch c (3) Princes' First, by Prince of Norfolk, dam Lizzie Idle.
6. John G. Sohn, ch s (4) Wild Robin, by Keystone, dam Rifleman Gladiator.
7. O. Appleby, b f (3) Juniata, by Wildidle, dam Monday Filly.
8. Charles Kerr, b s (5) Jackson, by Luke Blackburn, dam Ivy Leaf.
9. J. J. Dolan, b g (4) Revolver, by Joe Daniels, dam by Partisan.
10. E. Pickett, ch c (5) Peregrine, by Jumbo or Joe Hooker, dam Irene Harding.
11. Santa Barbara Stables, b s (7) Consuelo, by Grinstead, dam Nina R.
12. W. L. Appleby, ch m (5) Carmen, by Wildidle, dam Nettie Brown.
13. W. L. Appleby, ch m (4) Odette, by Shiloh, dam Margery by Error.
14. Wesley George, b g (a) Applause, by Three Cheers, dam Aline N. by Norfolk.
15. O. Appleby, br m (4) Alfarata, by Wildidle, dam Monday filly.
16. Owen Bros., b m (a) Daisy D., by Wheatly, dam Black Maria by Belmont.
17. George Hearst, ch f (3) Minneola, by Warwick, dam Belle S.
18. N. A. Covarrubias, b s (4) Dan. M. Murphy by imp. Speculator, dam Leona.
19. G. H. Kennedy, b f (2) Acclaim, by Three Cheers, dam Rosette.
20. L. J. Rose, b g (3) Rico, by Shannon, dam Fannie Lewis by imp. Buckden.

No. 12 —Running—The Capital City Stake, a handicap for three-year-olds; of $100 each, h f; $20 declaration; with $400 added; second horse, $100. Weights announced by 10 o'clock A. M. Saturday, Sept. 13th. Declarations due by 6 P. M. same day. One mile and a sixteenth.

1. Palo Alto Stock Farm, ch f Muta, by Wildidle, dam imp. Mutiny by Adventurer.
2. P. Siebenthaler, ch c Sheridan, by Young Bazaar, dam Lost Girl by Leinster.
3. L. U. Shippee, b m Mabell F., by Longfellow, dam Carrie Phillips by Pat Malloy.
4. L. U. Shippee, b c Take Notice, by Prince Charlie, dam Nota Bene by Gleneig.
5. Elmwood Stable, b f Initiation, by Inauguration, dam Brown Maria.
6. W. L. Appleby, b f Raindrop, by Wildidle, dam imp. Teardrop.
7. Owen Brothers, br s Captain Al, by Kingston, dam Black Maria by Belmont.
8. Matt Storn, ch f Marigold, by Milner, dam Katy Pease by Planet.
9. W. M. Murry, b c Leland, by Flood, dam Amelia by Lowlander.
10. L. J. Rose, b g Rico, by Shannon, dam Fannie Lewis by imp. Buckden.

No. 13.—The Sunny Slope Stake, a sweepstake for two-year old fillies (foals of 1888); of $50 each, h f, or only $10 if declared on or before Jan. 1st, or $15 by May 1, 1890; declarations without money are void; with $350 added, of which $50 to second. Non-winners allowed five pounds. Five-eighths of a mile. Closed in 1889 with 20 nominations.

No. 14.—Running—Selling purse, $350, of which $50 to second; for all ages. Horses entered to be sold for $2000 to carry rule weights; one pound off for each $100 down to $1000; then two pounds for each $100 down to $500. Horses entered not to be sold to carry five pounds above the scale. Valuation to be placed on starters only by 6 P. M. Saturday, Sept. 13th. One and one-eighth miles.

1. Undine Stable, ch g (5) Tycoon, by Reveille, dam Margery, by Error.
2. P. Siebenthaler, ch c (2) Sheridan, by Young Bazaar, dam Lost Girl, by Leinster.
3. M. T. Walters, b g (4) Albatross, by Pill Box, dam Della Walker.
4. Dennison Bros. b s (3) Mohawk, by Norfolk, dam Irene Harding, by Jack Malone
5. H. D Miller, ch m (a) Ida Glenn, by Glen Ellen, dam Queen.
6. Captain A. B. Anderson, ch s (4) Four Aces, by Hock-Hocking, dam Maid of the Mist.
7. A. Hiller, b g (3) Achilles, by Norfolk, dam Thetis, by Ten Broeck.
8. Elmwood Stables, ch m (7) Nerva, by Bob Wooding, dam Lizzie Marshall.
9. W. L. Appleby, b g (4) Wild Oats, by Wildidle, dam Mary Givens.

California's Stallions.

I beg to announce that, with a view of perpetuating the forms and characteristics of the leading stallions of California, I am issuing a series of lithographic likenesses. Each portrait issued will be an acknowledged likeness, the result of a close study of the horse and an artistic treatment of the subject. In order to secure for the series an immense advertising value, from a breeder's point of view, 4000 copies, at least, of each portrait will be issued.

Terms, $100 for first issue of 100 copies. In quantity, for advertising purposes, copies will be furnished at low rates.

H. BOYD, Artist.

268 Golden Gate Ave,, San Francisco.

Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, *or beyond the time he intends to pay for it*, let him not fail to write us *direct* to stop it. A postal card (costing one cent only) will suffice. We will not knowingly send the paper to any one who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent. LOOK CAREFULLY AT THE LABEL ON YOUR PAPER.

ROAD CARTS in great variety, also our $35 Phaeton Body Cart. Write for Circulars, Frank Brothers, San Francisco.

California Inventors Should consult DEWEY & CO. AMERICAN AND FOREIGN PATENT SOLICITORS, for obtaining Patents and Caveats. Established in 1860. Their long experience as journalists and large practice as Patent attorneys enables them to offer Pacific Coast Inventors far better service than they can obtain elsewhere. Send for free circulars of information. Office of the MINING AND SCIENTIFIC PRESS and PACIFIC RURAL PRESS, No. 340 Market St., San Francisco. Elevator, 19 Front St.

Truman, Hooker & Co's Vineyard Cart.

FARMER'S VINEYARD CART.

Side-boards can be taken off. Wheels high. Tires wide. Strong, serviceable and extremely low in price. Tires 3 to 4 inches wide. Hollow iron axles and solid iron axles. Especially adapted to vineyard and farm work, *with wide tires, narrow track.* Light, strong, and made of the best material. Measures 4 feet 6 inches from point of hub to point of hub, which enables it to be used in any place on a vineyard or farm where an ordinary cart or wagon cannot; and the side-boards being high, it carries a larger load than a cart. Write for prices.

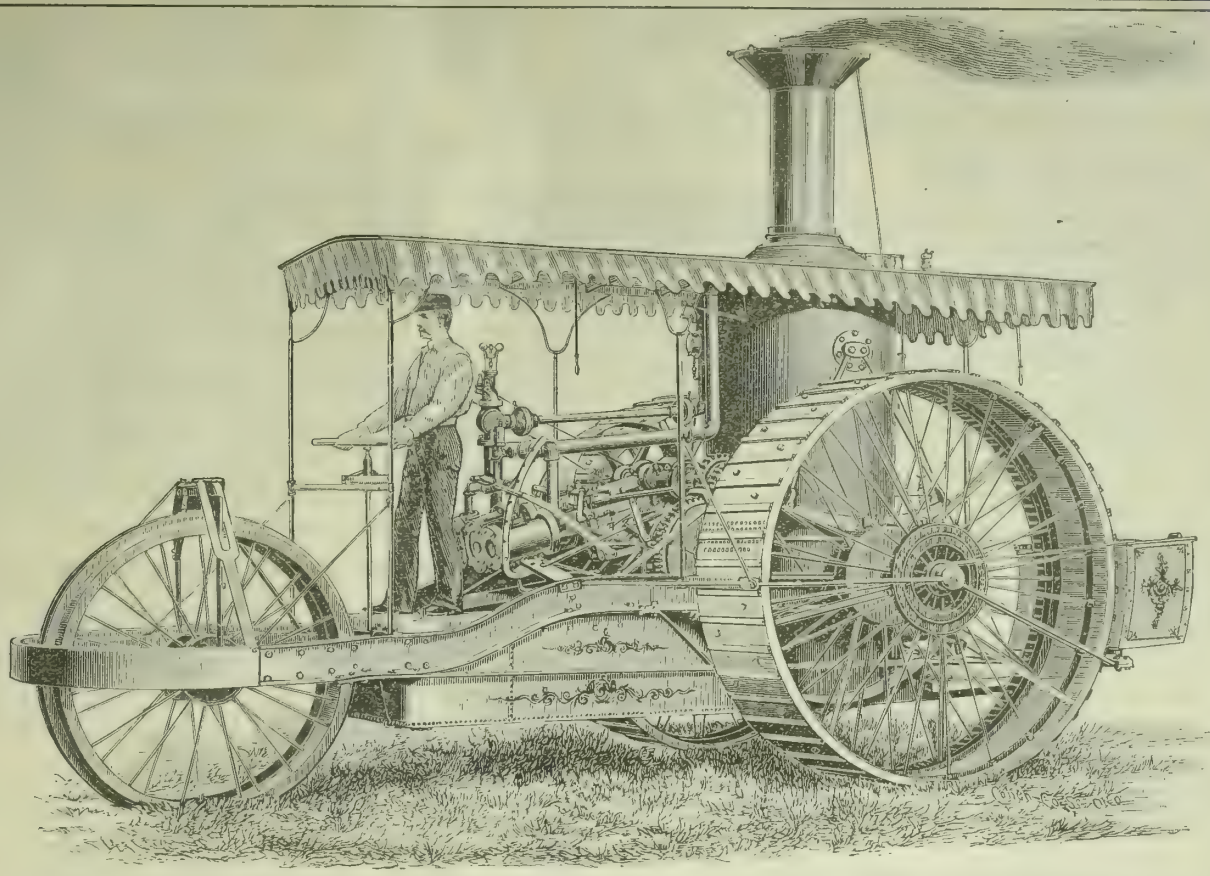
A Great Sale of Holsteins and Standard Bred Horses.

We call attention to the sale of Mr. J. H. White of Lakeville, to be held in this city on September 4th, consisting of his entire herd of thoroughbred Holsteins and a number of standard-bred horses.

The herd of Holsteins was made up from a noted herd imported from the north of Holland, in 1884, the animals being selected by Theodore Koch from such noted strains as the Jacobus, Leegwater, Pieter and Simon herds. The head of his herd, Oro Blanco, was bred by C. Rus, Haarlemmermeer, North Holland. A good cut of him appeared in the RURAL PRESS of December, 1888, as also two of his noted cows—Winfridala No. 8032 (Holstein Herd-Book), who has been a famous prize-winner, and Annemie No. 8026 (Holstein Herd-Book), bred by P. Koppes, Haarlemmermeer, North Holland. Mr. White's cattle are registered and have been pronounced by experts among the best on the Pacific Coast. This sale will give our breeders a good opportunity to procure some of the most noted cattle and horses in this State.



CITY FLOWER THIEVES.—The Board of Directors of the State Floral Society have presented a communication to Chief of Police Crowley, calling attention to the stealing of plants, shrubbery and flowers from private grounds and the various cemeteries, and asking that he instruct the officers of the department to exercise as much vigilance over this kind of thievery as over other classes of crime.

Stockton Combined Harvester and Agricultural Works.

An important industry for Stockton during the last 18 months has grown into large proportions, and is a feature of no little interest to our State. The increased demand for street cars, and especially for cable and electric street cars, induced this company during the interim of manufacturing agricultural machinery and implements to build a small number of street cars for local use. These cars were in merit, durability, lightness of draft and attractive appearance much superior to any that had been in use in this section, and soon brought orders from adjacent cities for duplicates. This business has steadily grown in volume until it has become a leading branch of this great plant. The superintendent, Mr. Elliott, made this department an especial study, and it is but a proper tribute to his skill and handiwork to say that he has brought out a car that has been pronounced by experts the best street railroad car on the Pacific Coast, if not the best in the United States.

A RURAL reporter visited these works last week and saw the foundation-work for 25—mostly electric street cars—and was informed by Mr. Elliott that there were orders on their books for 60 more. The destination of these cars is largely for Oregon and Washington, with some few for the southern portion of our State.

Mr. M. Laufenburg, a very skillful and experienced inventor, has designed and built a new combined harvester that is claimed to have lightness of draft and other qualities which adapt it to the wants of small farmers and those who desire only to harvest their own crops. A cut and full description of this new harvester will appear in our columns.

JACOB PRICE'S FIELD LOCOMOTIVE—EXACT REPRODUCTION FROM PHOTOGRAPH.

Jacob Price's New Field Locomotive.

[Patented Jan. 14th, 1890.]

A full-page advertisement appeared in last week's RURAL in the form of a communication from D. L. Remington, accompanied by a cut of his traction engine. In Mr. Remington's article he takes Mr. Price to task for failing to give him (Remington) proper credit for what he has done for steam plowing, in an article relative to Price's machine published in an Eastern trade paper a few weeks ago.

We know nothing of the merits of the controversy between these two gentlemen, but it would seem that Mr. Remington could hardly expect Mr. Price to advertise a competitor.

However, be these things as they may, the RURAL, in pursuance of its usual custom in illustrating and describing new inventions, presents on this page an excellent picture of Mr. Price's new machine, which can be seen any time between now and September 10th, plowing near San Leandro, California, in a firm, dry soil, with twelve 11-inch plows (four gangs of three plows each).

It is said to walk along with them with the utmost ease as fast as a man can walk, and appears to be capable of hauling as many more.

The cut shows its construction so clearly that little is left for the written

DESCRIPTION.

It is of about 100 horse-power—as horse-power is commonly figured—or, to express it in another manner, it will pull as much as 40 or 50 horses, besides propelling itself. Its weight is only 8½ tons. The carrying wheels are about 8 feet high and 26 inches wide. The steering wheel is 5 feet high and 14 inches wide. The boiler is an enlarged fire-engine boiler of the most approved type and is made strong enough to carry 200 pounds working pressure with safety. Its *fire* surface is 200 feet and its other heating surface (flues) 200 more, making a total heating surface of 400 feet. The main gears *are steel rollers working on oiled steel pins*, and the remainder are made from metal patterns cut by the celebrated gear-makers, Brown & Sharp, of Providence, Rhode Island. The entire machine is mounted on long, easy, elliptic springs, in a manner that utterly obviates any interference with the working of the gears, a result, according to Mr. Price, never accomplished before. The machine has twin engines, piston valves and link motion. It is adapted for plowing, running combined harvesters, freighting with wagons, hauling saw logs, or pulling of almost any kind, and is suitable for any stationary work such as running threshing machines, sawmills, etc. It is made in two sizes, the larger one being as shown and described above, and the smaller of about half its weight and power. Its appearance, as is evident from the cut, is much in its favor, being very compact and neat as well as convenient in the matter of throttle and reversing levers and steering gear. It is almost wholly of forged steel, and was made at the works of the J. I. Case Threshing Machine Company, Racine, Wisconsin, by Jacob Price of San Leandro, California, and also of Racine, Wisconsin.

Large, illustrated circulars, giving prices and full particulars, may be had by addressing Mr. Price at San Leandro.

J. M. WELSH, President. M. D. BAKER, Secretary.

Important Auction Sale

— OF —

Standard and High-Bred Trotting Horses

— AND —

THOROUGHBRED HOLSTEIN CATTLE.

Property of J. H. WHITE, Esq., Lakeville, Sonoma County, Cal.

On Thursday and Friday, September 4th & 5th, 1890.

At RAILROAD STABLES, Cor. Turk and Steiner Sts., San Francisco.

On account of a contemplated change in business, we are authorized by Mr. White to dispose of all the high-bred stock upon his noted breeding farm at Lakeville, Sonoma County. This comprises over forty head of high-bred Trotting Stallions, Brood Mares, Colts and Fillies, most of them standard and all exceptionally fine individuals. They consist of the get of Stallions by Electioneer, Director, Antevolo and other noted horses. Most of the brood mares are with foal by Hernani, one of Electioneer's most prominent sons. Several have been bred to Director. Taken collectively they are, in size and form, the finest looking lot of trotters yet offered in California, and their breeding is upon the most approved speed lines.

The Cattle comprise over one hundred head of thoroughbred registered Holstein Cattle. The progenitors of this herd were selected of the choicest strains upon the famous breeding establishments East, and have been judiciously crossed with a view to develop to the fullest extent the milking strains. Mr. White has expended a large sum of money and great care in perfecting this band of cattle, and can justly claim it as one of the superior herds of the United States.

Catalogues are being prepared and will be sent on application only. Horses and cattle may be seen at ranch, six miles from Petaluma.

KILLIP & CO., Auctioneers, 22 Montgomery St., San Francisco.

THIRD ANNUAL AUCTION

— OF —

HOLSTEIN-FRIESIAN CATTLE

At SACRAMENTO, September 13, 1890.

By order of **FRANK H. BURKE of Menlo Park** we will sell, without reserve, Bulls, Cows and Heifers. Included in this sale will be all of the celebrated PRIZE-WINNING ANIMALS, and the winners of Sweepstakes and Gold Medals during the past year, about 30 head in all.

These animals are ALL THOROUGHBRED AND REGISTERED and from the choicest families, including the AAGGIES, NETHERLANDS, JACOBS, MENLOS and TWISKS. It is the only offering ever made on this Coast of these extra fine butter and milk tribes.

For further particulars apply to

Red Polled Cattle.

We have 19 head of Imported Stock.

Young Bulls and Crossbreds on Devons for sale.

H. MECHAM,

Importer and Breeder of Shropshire Sheep

They were all imported from England in '88, or bred direct from Imported Stock, and all registered.

H. MECHAM,

—BREEDER OF—

American Merino Sheep Without Horns.

The only flock in the United States. When we bought our sheep East 20 years ago, among them was a ram without horns. He grew to be a large fine sheep, shearing at 2 years old, a 12 months' fleece, 35 lbs. of long white wool.

I have bred from him and his get ever since and have never made an out-cross and never used the same ram but one year on the same flock. My rams at 2 years old will weigh from 160 to 180 lbs.; have a strong constitution, without wrinkles, and will shear on an average about 25 lbs., a 12 months' fleece, of long white wool. Rams and Ewes for sale. **P. O. Address:**

Stony Point, Sonoma Co., Cal.

R. R. Station, Petaluma.

S. F. Market Report

Market Review.

DOMESTIC PRODUCE, ETC.

SAN FRANCISCO, Aug. 20, 1890.

General trade in farm products has been fairly active at good prices. Fruits have held firm, while hay, hops, wheat and barley have advanced. The Eastern and European markets for wheat show quite an appreciation in values. The following is to-day's cablegram:

LIVERPOOL, Aug. 20.—Wheat — Moderate demand, California spot lots, 7s 2½d to 7s 6d; cargoes off coast, 38s 9d; just shipped, 38s 6d; nearly due, 38s 9d; cargoes off coast, improving; on passage, firm; Mark Lane wheat, firmer; wheat and flour in Paris, turn dearer; weather in England, fine after rain.

Foreign Grain Review.

LONDON, Aug. 18.—The *Mark Lane Express*, in its review of the British grain trade during the past week, says: Harvest is making active progress. The wheat crop varies greatly, according to localities. The crop is full in heaviest growing counties. New wheat shown in London and provincial markets samples well. Supplies of old are almost exhausted. So low are farmers' reserves that the total supply of old corn in the country, whether as wheat or flour, does not exceed 4,000,000 quarters. Foreign wheats are hardening, and prices show an average advance of 6d. Flour firm. Corn strong on advices concerning American crop, combined with cable dispatches from Buenos Ayres, stating that supplies there are exhausted. To-day the market closed decidedly dearer.

Liverpool Wheat Market.

The following are the closing prices paid for wheat options per ctl. for the past week:

	Aug.	Sept.	Oct.	Nov.	Dec.
Thursday	7s6½d	7s5½d	7s5½d	7s5d	7s8d
Friday	7s6½d	7s6½d	7s6½d	7s5½d	7s7½d
Saturday	7s5½d	7s6d	7s6½d	7s5½d	7s8½d
Monday	7s6½d	7s6½d	7s6½d	7s5d	7s8½d
Tuesday	7s6d	7s6½d	7s6½d	7s5d	7s8½d

The following are the prices for California cargoes for off coast, nearly due and prompt shipments for the past week:

	O. C.	P. S.	N. D.	Market.
Thursday	38s3d	38 6d	38s6d	Firmer.
Friday	38s6d	38s6d	38s6d	Strong.
Saturday	38s6d	38s6d	38s6d	Strong.
Monday	38s6d	38s6d	38s6d	Firmer.
Tuesday	38s9d	38s6d	38s9d	Strong.

Eastern Grain Markets.

The following shows the closing prices of wheat in New York for the past week:

Day.	Aug.	Sept.	Oct.	Nov.	Dec.	May.
Thursday	103⅝	104	104⅜	104⅝	105⅝	...
Friday	104⅛	105½	106⅜	106⅝	106⅞	...
Saturday	106⅜	107½	107⅞	108⅛	109½	...
Monday	106⅛	107	107⅝	108⅛	109	114
Tuesday	109⅜	110½	111⅜	111⅝	112½	115⅝

The closing prices for wheat have been as follows at Chicago for the past week:

Day.	Aug.	Sept.	Dec.	May.
Thursday	98¾	100	105⅞	107⅞
Friday	100⅝	101⅝	104⅝	108⅝
Saturday	102	103⅛	106⅛	110
Monday	101	102	105¼	109⅛
Tuesday	105	105½	109⅜	113⅜

CHICAGO, Aug. 20. — Wheat — $1.04½ for August, $1.05 for September, $1.08¾ for December and $1.13 for May.

NEW YORK, Aug. 20.—Wheat—$1.11⅛ for cash, $1.09⅞ for September, $1.12⅜ for December and $1.16¼ for May.

Hops.

NEW YORK, Aug. 17.—Hops closed with a strong market, helped by the English crop estimates. Choice on spot is firm, 20@25c; other useful old, 10@15c; poorest, 5@7½c; 200 Washington, contracted for at 27½c, landed here.

CHICAGO, Aug. 17.—Hops are held firmly on account of the strength prevailing elsewhere. There is said to be a very fair demand, with good prospects for continuing. Brewers are only sparingly supplied, and are in a position which obliges them to remain on the market as buyers. Sales are at the following figures: Washington and Oregon prime, 23@24c; do. low grades, 18@22c; California choice, 23c; do. prime, 20@21c.

The *Mark Lane Gazette*, July 28th, reports as follows: From a personal inspection of the principal hop districts of England, we should estimate the coming crop to yield, with everything in its favor from to-day, 300,000 cwt., and it may, with adverse weather, fall very far short of this. England's consumption is now 700,000 cwt. of hops per annum. It will not be possible to import our deficiency. Every cwt. of old hops will be wanted to keep the brewers going until the 1891 crop is secured. To-day there has been a demand for them; they are very good and selling at ridiculously low prices. Eighteen hundred and eighty-nine hops have a further rise to-day; the lowest are now making five pounds and the finest eight pounds. The position of the market is now much more serious than it was at this time in 1882, and October may see much higher prices than ruled then.

Eastern Wool Markets

PHILADELPHIA, Aug. 15.—Wool is nominal.

BOSTON, Aug. 15.—Wool is steady. The largest transactions were in Territorial and Texas at 16@24c, or on a scoured basis of 57@60c.

NEW YORK, Aug. 15.—*Bradstreet's* says: The wool markets are unchanged and uninteresting. Enough material is going into consumption to hold prices steady, but too little to present any appearance of activity. There is a general disposition on the part of buyers and sellers alike to await developments with respect to the pending tariff legislation. In the Boston market fine fleeces are quiet, the bulk of the week's business having been done in Territory and Texas wool. Fewer worsted manufacturers than a week ago have been on hand. At Philadelphia the inquiry for fleece wool is rather better. In the New York market, and indeed elsewhere, quotations are in great measure nominal. The fall clip in California, it is reported, will be unusually small, partly because of large losses of sheep last winter and partly by reason of increased demand for mutton.

Fruit Prospect.

SPRINGFIELD, Mass., Aug. 14.—The *New England Homestead* says: Apples will be scarcer and more costly this season than for many years. There is but half a crop of winter fruit in the famous Annapolis valley, Nova Scotia, and still greater reductions in the apple belt of Southern and Western Ontario and Michigan. In Maine and limited sections of Vermont and New Hampshire there is a fair yield. Throughout Southern New England, New York, Pennsylvania, New Jersey and the interior States generally the promise of winter fruit is worse than ever before known. The great apple belt of Western New York has almost no crop whatever. Curiously enough, there is an area in Missouri and Kansas within a radius of 100 miles of Kansas City in which there is a phenomenal crop of winter apples of fine quality. Eastern buyers are already gobbling it up at good prices. Summer and fall apples are also short and command good prices. Peaches are a practical failure in Southern Ontario and Michigan, as well as in the Southern States and Connecticut. Pears and plums yield unevenly, but far below the average crop. Grapes, however, are an immense crop, save in sections of New Jersey and the South, where the black rot is playing havoc with this fruit. The scarcity of other fruits will sustain the market for grapes.

The *Homestead's* preliminary report of the potato crop indicates a disastrous shortage in the South and West, curtailed in New York, and a fair average in New England, if spared by the rot, which is now making its appearance.

WASHINGTON, Aug. 18.—The August crop bulletin, just issued, says: The prospect for both apples and peaches is poorer than it was one month ago. The intimation in previous reports that the condition in New England and along our northern territory, returned high in the early reports, would decline as the season advanced, has been proven correct. The decline in those sections has been heavy, although their prospect is slightly better than that of the adjoining States. The causes which have operated to bring about the present low prospect have been noted in previous reports—unfavorable weather during the winter and spring and the frosts of March. The present returns show that the results of the cold weather are still apparent in the blasting and dropping of immature fruit. The Pacific Coast alone reports a medium prospect, California standing at 78, Oregon at 83 and Washington at 90. The peaches on the slope are in poorer condition than the apples, the California average being but 65. As compared with other fruit, the condition of grapes is comparatively light, especially so on the Pacific Coast. In the States on the Atlantic Coast the present prospects point to a crop of medium proportions, though the conditions vary locally in some of the States.

BAGS—The market is strong at another advance. Calcuttas standard-sized are quoted at 8c. The higher price of silver is in favor of holders.

BARLEY—The market has been quite active at steadily advancing prices. In futures, trading has been fair. The bear contingency has been so badly crippled that they do not venture to sell much short; the principal sellers are the bulls, having a profit in sight. The following are to-day's reported sales:

Morning Session: Buyer 1890 — 100 tons, $1.37½; 200, $1.37¾; 300, $1.37½; 200, $1.36⅞; 100, $1.37; 100, $1.36⅝; 200, $1.36½. Buyer season—200 tons, $1.41¼; 400, $1.41⅜; 600, $1.41½; 200, $1.41 ₩ ctl. May—100 tons, $1.35 ₩ ctl. Afternoon Session: Buyer 1890—100 tons, $1.37; 500, $1.36¾; 100, $1.36½. Buyer season—100 tons, $1.40½; 100, $1.40⅜; 300, $1.40¾ ₩ ctl.

BUTTER—The market is barely steady under freer receipts and more attention given to pickled. The latter is in heavy supply.

CHEESE—The market appears to have a steadier tone under a slightly increased demand.

EGGS—The market is strong and higher. About all the surplus held in cold storage has gone into consumption.

FLOUR—The market is strong, but not quotable higher.

WHEAT—The sample market continues strong, with buyers paying in the country an advance on city quotations. Charters are higher, 47s. 6d. being bid for a handy-sized iron vessel. The advance in silver, now $1.20 an ounce against 92¼c on August 20, 1889, is in favor of holders of wheat. In futures, trading has been fair. Frosts at the East, wet weather in England and high price of silver make the bears cautious. The following are to-day's reported sales on Call:

Morning Session: Buyer 1890—200 tons, $1.46½; 900, $1.46¾; 100, $1.45⅞; 100, $1.45¾. Afternoon Session: Buyer 1890—100 tons, $1.45¾; 100, $1.45⅞; 400, $1.45½; 1500, $1.45⅝. Buyer season—500 tons, $1.54½; 100, $1.54¾ ₩ ctl.

[COMMUNICATED.]

Market Information.

Cereals.

The *Mark Lane Express*, Aug. 4, in reporting the meeting of the National Association of Millers, says that James W. Rush read a paper on "The World's Wheat Crop and Wheat Values." In the course of his remarks he said that in the United States the population was estimated to exceed 65,000,000, and the requirements of wheat amounted to 375,000,000 bushels, while the average production in the ten years since 1880 did not exceed 442,000,000 bushels, the production in the present year being only about 430,000,000 bushels. It was notorious that our requirements in this country were much larger, while the acreage under wheat was much smaller than in 1880. France, Germany, Belgium and Holland had stood practically still in the matter of wheat production, while in Spain and Italy the increase in the home requirements had largely exceeded that in the home production of wheat. But in Russia, Roumania, Austria and Hungary there had been a decided increase in the production of wheat. He was of opinion that America was approaching the time when she must considerably increase her wheat acreage or fall out of the ranks of wheat-exporting countries. The ensuing season was not going to be one of undue abundance, nor of any serious scarcity as far as wheat was concerned.

The talk is that the United States corn crop will probably be short 1,600,000 bushels, owing to the amount of ground abandoned. In the short crop of 1887 there were 5,000,000 acres of corn so badly damaged that it was left ungathered, and the estimate is that there will be 4,000,000 acres abandoned this year. Norton & Worthington of Chicago say of the position: "It is a question if at the advanced prices for both corn and oats the deficiency in supplies has not been fully discounted. In this connection we will remind our friends that the crop of 1887 was 1,456,000,000 bushels after a crop of 1,665,000,000 bushels in 1886; and the price of corn here ranged 54c to 60c during May, 1888; 46¼c to 35⅝c during June; 45⅜c to 50½c during July."

The wheat crop indicated this year by the State reports so far received compared with the Government report of last year as follows:

Wheat.	1890.	1889.
Indiana	26,700,000	41,187,000
Ohio	27,700,000	36,865,000
Kentucky	3,500,000	10,812,000
Kansas	28,000,000	30,942,000
Illinois	14,500,000	38,014,000
Totals	95,000,000	157,790,000

In spring wheat the Minneapolis *Market Record's* estimate gives the crop of Dakota and Minnesota 90,000,000 bushels, against 87,000,000 last year.

The wheat market has ruled fairly strong throughout the week, although an attempt was made to break prices but without success, owing to holders' firm views. The light tonnage here is used by buyers against the market for immediate delivery. Speculators and exporters are taking all the choice parcels offering, paying in the interior a slight advance on city quotations. The advance in silver will tell largely in favor of wheat, owing to the higher cost of Indian and Russian wheat delivered in England, France and Germany.

Barley has held strong at slightly higher prices. Receipts have been large, but not in excess of the demand, which keeps stocks well in hand. The prevailing opinion is that still higher ranges will obtain. This opinion is grounded upon the small crop and large demand.

Notwithstanding receipts have been free, the market holds strong. Much of the strength is due to the light crop in the Central States and the well-grounded belief that prices will rule higher in 1891.

Rye moves slightly freer at full quotations. Some holders ask an advance on quotations.

Feedstuff.

Ground feed, bran, middlings and ground barley are higher with the market strong. The demand is good. Feedmeal is firm.

Receipts of hay are large, but stocks light, owing to a good shipping and home demand. The yield in this State is not up to the average, and as the consumption is large, the market, it is claimed, will rule strong throughout the season. The yield in Oregon and Nevada is said to show quite an increase over last year.

Fruits.

Under heavy receipts and forced sales, owing to many overripe fruits coming in, the market for pears and peaches broke, and remained low up to Monday, when an improvement set in, resulting in better prices at the close. Canners are again in the market, having worked up their surplus. At the close, canning plums, gages, peaches and pears are quite strong.

Nectarines and figs are in lighter receipt, but no higher.

Table grapes show more strength, with the more choice fetching an advance. The quality is improving. There is a good home and shipping demand. For wine grapes correct quotations in this city are hard to get. Interior prices are unchanged.

For dried fruits the market is essentially unchanged, except for apples, which show more strength, owing to unfavorable crop reports received from the East. As near as we can learn, orchardists are free sellers, not caring to hold too long. For fruits in sacks the following is the range, with something extra going a shade above our outside quotations: Evaporated apples, 11½@13c ₩ lb.; sliced, 8@9c; quartered, 7½@8c; pitted plums, 7½@9½c ₩ lb.; evaporated peaches, 18@20c; bleached apricots, sacks, 13@16½c; boxes, 16½@18c; white nectarines, 14@16c; red nectarines, 12½@13½c; prunes, 7½@10¾c; grapes, 3½@4c ₩ lb.

Buyers are trying to get lower prices on raisins, but so far without success. The market for well-known brands is reported firm. It is claimed that the shipments by sea will show a large increase, while the East will call for more. For September-October delivery, buyers quote layers at $2@2.25, according to brand, with some quoted even lower. Loose Muscatels are quoted at from $1.75@2, with still lower figures named for common to fair. In the sweat, 5@6c is quoted.

Vegetables.

In garden truck the market does not show any material change.

Onions, under light receipts and a good demand, have advanced, closing strong. Since Jan. 1, 1890, the overland shipments aggregate 132 tons.

Notwithstanding the heavy receipts, potatoes have strengthened, closing very strong under a good demand. The overland shipments since Jan. 1st aggregate 2494 tons. Of this, 1320 tons were shipped from Los Angeles.

The shipments of vegetables overland aggregate 1657 tons since Jan. 1, 1890.

Live-stock.

Bullocks and mutton sheep are offering free, causing a weak market. The stock in Arizona and Nevada is in most excellent condition. Many cattlemen are driving their stock to Nevada, owing to the good pasturage in that State. Hogs are steady at full prices. In milch cows there is nothing new to report. Common to fair work horses are offering quite freely. General utility horses and matched teams are inquired for.

The market for dressed cattle is quoted as follows [to obtain the price on foot, take off from the price for stall-fed one-third to one-half, according to the nature of the feed and time fed; and for grass-fed take off the price from 40 to 60 per cent]:

HOGS—On foot, light grain fed, 4¾@4¾c ₩ lb; dressed, 7¼@8½c ₩ lb.; heavy, 3⅞@4¼c ₩ lb.; dressed, 5¾@6¼c ₩ lb. Stock hogs, 4¼@4½c ₩ lb

BEEF—Stall fed, 6½@—c ₩ lb.; grass fed, extra, 6@—c ₩ lb.; first quality, 5¼@5½c ₩ lb.; second quality 4¾@5c ₩ lb.; third quality, 4c@— ₩ lb.; bulls and thin cows, 2@3c ₩ lb.

VEAL—Small, 6@8c ₩ lb.; large, 4@6c.

MUTTON—Wethers, 6½@7c ₩ lb.; ewes, 6@6½c ₩ lb.; lamb, spring, 7@8c.

Miscellaneous.

From the *Commercial News* of Aug. 20th the following summary of tonnage movement is compiled:

	1890.	1889.
On the way to this port	288,350	237,800
On the way to neighboring ports	21,250	20,500
In port, disengaged	5 215	17,325
In port, engaged for wheat	37.454	59.238
Totals	352,269	344,863

To get the carrying capacity, add 65 per cent to the registered tons as given above.

From July 1, 1890, to Aug. 13, 1890, the following are the exports from this port:

	1890.	1889.
Wheat, ctls	1,045.439	1,162,753
Flour, bbls	136,514	158,142
Barley	35,106	127,286

Poultry has held strong throughout the week. Receipts overland are only fair.

For future delivery, nuts continue in good demand, with full prices secured quite readily.

Hops are in good demand at advancing prices. It is stated that 22½c was paid on yesterday for a choice article.

Wool is in fair demand at steady prices.

Hay products are firm, but no higher.

Honey continues barely steady. Receipts are lighter. The following are to-day's quotations: Choice white comb, 8@9c; do, in 1-lb. frames, 10@11c; ordinary comb, 7@7½c; white extracted, 5½@5¾c; amber, 4½@5c ₩ lb.

The overland shipments in last month aggregate as follows: Beans, 3315 ctls.; brandy, gals., 11,826; canned goods, 4,839,980 lbs.; dried fruits, 2,869,140 lbs.; deciduous fruits, 13,095,510 lbs.; citrus fruits, 98,750 lbs.; honey, 23,900 lbs.; wine, gals., 303,539; wool, lbs., grease, 1,777,810; pulled, 40,680; scoured, 342,190; potatoes, 28,887 ctls.; onions, 21,673 ctls.; hops, 80,370 lbs.; vegetables, 129,850 lbs.

The exports by sea in last month aggregated as follows: Flour, bbls., Central America, 2681; South America, 515; Mexico, 344; Panama, 300; Honolulu, 1039. Wheat, ctls., Cork, 175,587; Liverpool, 67,689. Corn, ctls., Central America, 1646; Honolulu, 150. Barley, ctls., Victoria, 281; Honolulu, 3797. Beans, lbs., New York, 23,758; Central America, 1037; Victoria, 2898; Apia, 2362; Honolulu, 20,857. Hay, bls., Honolulu, 1180. Brandy, gals., New York, 360. Wine, gals., New York, 76,556; Central America, 825; Honolulu, 6323. Potatoes, sks., Central America, 281; Mexico, 261; Honolulu, 1166. Hops, lbs., Victoria, 941; Honolulu, 204. Bran, sks., Honolulu, 1263. Onions, sks., Mexico, 135; Honolulu, 519. Oats, ctls., Honolulu, 519. Dried fruits, lbs., Victoria, 1375; Mexico, 624; Apia, 478; Honolulu, 2705.

California Fruits East.

NEW YORK, Aug. 17.—California fruit-growers are helping this side of the continent out of its comparative fruit famine most commendably. Last week 41 carloads, chiefly of pears and peaches, with a good assortment of plums, arrived. The early prices of the week were satisfactory. Two thousand five hundred boxes of Bartlett pears from one shippet sold at a range of $3 to $5.35 a box, mostly over $4. Peaches did well, selling from $1.80 to $3.05 a box of 18 to 20 pounds. A good many were damaged on the cars and had to be sacrificed at low prices. Plums are still desirable, but they begin to arrive. From all local accounts, California will rule the grape situation also this fall. Dried-fruit merchants are industriously trying to introduce dried grapes into this market to help them piece out the needs of next winter. There is an unusually heavy crop on the coast, and they sell freely in the East. Their cheapness—5¼ cents per pound; wholesale—will probably give them a place after consumers learn how to remove their somewhat objectionable seeds.

NEW YORK, Aug. 17.—Dried peaches will work up to California prices. This would be a good experimental season for dried peaches. Canned fruits rule high. Extra peaches, $3.20; Standard, $2.75 apricots, $2.25; white cherries, $2.40. Prunes hold their own, regardless of some disparaging comments that have been published here. Sellers of raisins at the moment seek buyers who, with the menace of low values in view, are in no hurry to contract. A few orders are named at $1.75@2 free on board. There is an industrious endeavor to widen the introduction of dried grapes. The cheapness leads to good results. Dried apricots steady, 18½@19c.

CHICAGO, Aug. 18.—Porter Bros. Co. sold ten carloads of California fruit to-day at the following prices: Beurre d'Anjou pears, $2.95@3; overripe, $1.50@2 20; Beurre Hardy pears, $1.85@2 25; Beurre Clairgeau, $2; Susquehannas, $1.75@2.10; Early Crawford peaches, $1.40@1.90; poor order, 90c@$1.20; Gros prunes, $1.25@1.30; Foster plums, $1 65; Muscat grapes, per half-crate, $1.65@1.75; Tokays, $1 80.

NEW YORK, Aug. 18.—Sgobel & Day sold six cars of California fruit to-day as follows: Bartlett pears, $2.80@3.55; Early Crawford peaches, $1.60@2.25; Gros prunes, $1.90@2 40; Egg plums, $2.05@2.15; Columbia plums, $1.80; Victorias, $1.70@1.95.

CHICAGO, Aug. 19.—Porter Bros. Co. sold to-day ten cars of California fruit: Bartlett pears, green, brought from $3 to $3.35; overripe stock, $1.40@2.50; Gros prunes, $1.10@1.35; Early Crawford peaches, $1.25@1.85; Susquehannas, $1.70@1.85; Orange Clings, $1.45@1.75; Quackenboss plums, $1.25; Muscat grapes, full crates, $3.10@3.20; half crates, $1.30@1.75; nectarines, $1.75.

The Montgomery Auction Co, sold to-day for account of Gregory Bros. Co. and others three cars of California fruit. Bartlett pears brought from $2.55 @2.50; late Crawford peaches, $1.55@1.50; Clings, $1.25@1; red nectarines, $1.40@90c; Bradshaw plums, $1.40; Egg plums, $1.15; Columbias, $1.40; Gros prunes, $1.60@1.25.

NEW YORK, Aug. 19.—The agents of the California Fruit Union auctioned to-day two carloads of Bartlett pears at $275@260 per ton. Prices on Bartlett pears are lower than last week. The demand is increasing.

CHICAGO, Aug. 14.—The Montgomery Auction Co, sold to-day for the account of the Earl Fruit Co. and the W. R. Strong Co. five cars of California fruit. Early Crawford, $1.50; Susquehanna, $1.45@1.35; Lemon Cling, Orange Cling, $1.35; Bartlett, $2.90; Gros, $1.45@1.40; Columbia, $1.45@1.20; Bradshaw, $1 20; half-crates Muscats and plums, $1.75@1.50; half-crates Tokay grapes, $2.55@2.20; half-crates Rose de Peru, $1.40; half-crates Fontainebleau, $1.20.

NEW YORK, Aug. 14.—The California Fruit Union auctioned off to-day two carloads of fruit. Gros prunes sold at $2.30@2 10 per box; Columbia and Bradshaw plums, $1.75; Yellow Eggs, $1.85; Bartlett pears, $4.40@3.50. The market on Bartletts is lower, the late high prices having checked the consumption. There is a strong demand for peaches, and supplies are moderate.

CHICAGO, Aug. 20.—California green fruits have fair demand, with ample receipts and offerings. Nectarines, bxs, 20 lbs, $'@1.26; peaches, Crawfords, bxs, 20 lbs, $1.75@2; do Orange Clings, $1.50@1.75; pears, bxs, Bartlett, green, $3@3.50; do ripe, $2@2 50; do Duchess, $2@2.25; Gros prunes, 20-lb bxs, $1.25@1.50; Purple Duane plums, 20-lb bxs, $1@1.25; Washington plums, 20-lb bxs, $1@1.25; Egg plums, 20-lb bxs, $1@1.25; Columbia plums, 20-lb bxs, $1@1.25; German prunes, 20-lb bxs; $1.50 @1.75; grapes, half-cases, 4 baskets, Fontainebleau, $1@1.25; do Muscat, $1.50@1.75; do Tokay, $1.50 @1.75; do Rose of Peru, $1@1.25. California dried fruits rule firm, with apricots quoted at 17½@18½c ₱ lb. The demand is fair and previous arrivals are about all taken. The crop is said to have been pretty well absorbed and dealers do not look for receipts to be anything more than very moderate. Peaches have hardly started to move. Samples of new goods are shown and for choice unpeeled the market is quoted at 22@24c ₱ lb. Dealers are afraid to accept bids for goods to arrive, as holders on the coast are so firm that they are liable to raise their views, and dealers do not want to sell unless they know they can place goods.

COWHIDE HORSESHOES, it is said, are fast coming into use in England and in many parts of the continent of Europe. It is claimed for this styled shoe that is much lighter, that it lasts longer, and that split hoofs are never known in horses using it. It is perfectly smooth on the bottom, no calks being required, the shoe adhering firmly on the most polished surface. Its elasticity prevents many sprains, the horse's steps being lighter and surer. It is said that straw, treated with chemicals unknown, has been used for horseshoes for centuries in Japan.

To Subscribers and Readers.

A HANDY PAPER BINDER—A. T. Dewey's patent elastic binder, for periodicals, music and other printed sheets, is the handiest, and very cheapest of all economical and practical file binders. Newspapers are quickly placed in it (as received) and held neatly, as in a cloth-bound book. It is durable, and so simple a child can use it. Price (size of this paper, Harper's Weekly, and Scientific American), 75 cents; postage 10 cents. Postpaid to purchasers of this paper, 50 cents. For sale at this office. Send for illustrated circular. Agents wanted.

VALUE OF PATENTS.—A short time ago it was revealed, in the course of a lawsuit, that stock in a baking-powder company in New York had reached the enormous value of $4200 a share, the original value of such shares being $100. A few days ago a patent-medicine man sued his wife, and incidentally it was stated that 49 shares of the patent medicine had paid the enormous dividend of $49,000 in one year.

Complimentary Samples.

Persons receiving this paper marked are requested to examine its contents, terms of subscription, and give it their own patronage, and as far as practicable aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription, paid in advance, 5 mos, $1; 10 mos., $2; 15 mos., $3. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber, please show the paper to others.

LARGE ESTATES.—It is generally supposed that this country can discount the world in the extent of some of its landed estates; but it appears that Australia may possibly go us better. Three estates were recently advertised for sale in Queensland, the first of which has an area of 454 square miles, of which the rent is $1600; the second has 648 square miles—about 415,000,000 acres—and the third 553. The one most advantageously situated is "within 100 miles of a railroad."

For Sale.—Valuable land in Tulare county artesian belt. 160 acres, 1½ miles southwest of Tulare city; 480 acres, 7 miles southwest of Tulare, with large flowing artesian well, well-finished two-story horse, large barn, etc.; 160 acres, 2 miles southwest of the above; 480 acres 3 miles southwest of Pixley and about 4 from Alila. For sale by owner in lots to suit at low prices, low interest and very easy terms. For further information, address LAND OWNER, Box 2517, S. F., or A. T. DEWEY, No. 220 Market street, San Francisco, Cal.

THE owner of a new tire, made of hollow spring steel, circular, oval or square, thinks that it will succeed rubber tires for wagons or bicycles. It can be fixed on so that it can never come off.

WORTH'S
PATENT
Combined Screw and Toggle Lever
WINE, CIDER
—AND—
OLIVE PRESS

Have discarded the second pressing, as I only got one-half gallon of wine. Every person who has seen the press working is satisfied that it is the best wine press for work, strength and durability.—WALTER PHILLIPS, Bennett Valley.

The wine press has given entire satisfaction.—E. E. MEYER, Wright's P. O., Santa Clara county.

We think your press is one of the most powerful presses ever made, and very simple to operate. A boy of ten years can run the press and do better work than a man on any other press we have ever seen.—J. & F. MULLER, Windsor, Cal.

Can press two tanks—2000 gallons capacity each—a day, and have plenty of time before 5:30 o'clock to clean everything, with one of your small size wine presses.—R. C. STILLER, Guberville, Cal.

Every wine maker should have one, especially when he does not distill his pomace.—VACHE FRERES, Old San Bernardino, Cal.

The working of your press has been fully up to your representations.—J. F. CRANK, Sierra Madra Vintage Co., San Gabriel, Los Angeles county.

The wine press worked quite satisfactory.—JAMES FINLAYSON, Healdsburg, Cal.

The wine press bought of you gave entire satisfaction. WM. HILL, Petaluma, Cal.

We take great pleasure in attesting the true merits of your wine press. The one in our winery gives the utmost satisfaction. We cheerfully recommend it as good as the best.—DOWNEY FRUIT AND WINE CO., Downey, Los Angeles county, Cal.

Can cheerfully recommend your press as being the most powerful and durable press I have ever seen, and can warrant its giving satisfaction.—WILLIAM PALMTAG, Hollister.

The small wine press bought of you gave entire satisfaction. Would recommend it for small cellars of 25,000 to 35,000 gallons capacity.—A. BURNHAM & SONS, Bennett Valley, Santa Rosa P. O.

W. H. WORTH.

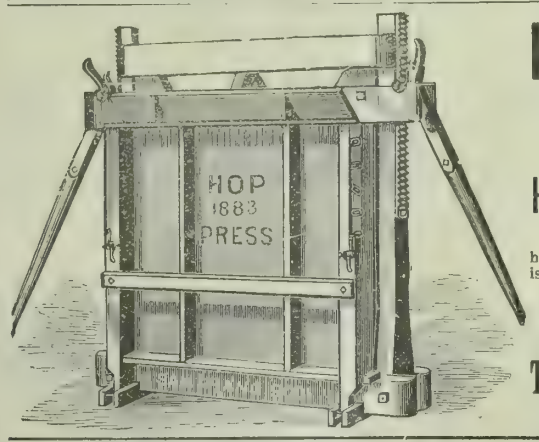
THE PELTON WATER MOTOR

Affords the cheapest and most convenient power for Ranch, Vineyard or Dairy purposes, as well as for running dynamos for electric lights, pumps and every other variety of machinery.

It possesses in the same degree the wonderful energy and power that has made the Pelton Wheel famous in all parts of the world.

These motors are made of varying sizes, with capacities ranging from the fraction of one up to 15 and 20 H. P., enclosed in iron cases, all ready for pipe connections, and are warranted to develop a given amount of power with one-half the water required by any other wheel.



The cost, considering capacity and efficiency, is fully 50 per cent less.

Circular, giving full information, sent on application.

Parties writing for information should give full particulars as to power wanted, source of water, supply, with head or pressure. Address

GRAPE ARBOR AT GREENFIELDS COTTAGE, KERN VALLEY, CAL.

Grapes on Trellises.

Visitors who see our thousands of acres of grapevines short-pruned so that they are but low, forked stumps in winter and low mounds of verdure in summer, may form the idea that the grapevine on arbor or trellis is unknown in California. Such is, however, far from the fact, for California, in addition to her large and rapidly extending area of short-pruned vineyard, has probably as notable long-trained vines as the world can show. The famous vines of the Santa Barbara region, which were so famous in word and picture 15 or 20 years ago, were spread over trellises or arbors of immense area. In most of our grape regions there may be seen vines similarly grown, either trained over high or long artificial supports or, of their own accord, covering large outbuildings or renewing the verdure of old, dead oaks with the foliage of the grape. Besides these notable instances of vine extension there are frequently seen vines grown on arbors or trellises, either for shade or landscape effect or because the behavior of the variety seems to demand long canes rather than the short-pruning system.

The engraving on this page shows one of our best specimens of grape arbors. It is on the Greenfields ranch, in Kern county. It extends 100 feet from the piazza of the superintendent's cottage to the yard, where stands the building in which the farm hands are fed and lodged. Our picture is from the cottage looking southward the entire length of the arbor. There are 25 vines planted on each side of the arbor, which have grown in 12 years trunks of three to four inches in diameter, and the canes so trained that the sides down to about five feet from the ground are thickly inclosed and are interwoven overhead into a dense mat of foliage. The picture, which is a direct reproduction from a photograph, may be trusted to tell its own story of the fruiting of these vines. The framework of the arbor needs to be well made to sustain such a burden. It is nine feet in width and ten feet to the arch overhead.

Old Folks' Day.—Here is a hint from Indiana for fair managers. One of the features which draws a crowd at the Gibson county fair is "Old Folks' Day," when all over 70 years of age are admitted free and treated to a dinner. Over 225 old citizens took their places and listened happily to an address from two prominent speakers on Ye Olden Times. This day is spoken of as one of the best, and the attendance large.

The farmers of Orange county made money enough to wipe out $181,000 in mortgages last year.

Horticultural Progress.—To increase the practical value of the census returns in the interests of agriculture, a number of inquiries never before made in a census were included this year; for instance, in the Horticultural Section, in addition to giving the number of "acres" planted in fruits and "bearing trees," apples, peaches, vines, etc., the new census has additional columns for "young trees not bearing," "young vines not bearing," and thus the progress in any given kind of fruit will be indicated for each county and State in the Union. When the returns show an increase in "young trees not bearing" and "young vines not bearing," those sections of the country where fruit-growing is prosperous and is being extended will be plainly pointed out. California should astonish the country in this line of progress. We trust that the census of 1890 may supply data which has not been available hitherto.

Correspondence

Correspondents are alone responsible for their opinions.

From Creston to Carpinteria.

An Itinerary.

Editors Press:—I left Creston Tuesday morning, August 12th, with team for San Luis Obispo, 25 miles southerly. The first four miles lay through the Huer Huero rancho, subdivided and sold to settlers within the last five years at rates ranging from $10 to $20 per acre, part valley and part rolling hills, friable soil, white and blue oak timbered. Thence six miles to the Salinas river, through canyons, over heavy grades and a rocky, brushy country. Thence five miles through the Atascadero and Santa Margarita ranches, over pine, oak and brush ridges, friable soil, to

Santa Margarita,

The present terminus of the railroad. The town is situated in a beautiful valley, 3000 or 4000 acres in extent, studded with heavy white oak timber. Several thousand acres have been subdivided recently and offered for sale at rates ranging from $20 to $100 per acre; soil, deep and rich; hills surrounding; light soil; good fruit land. Thence ten miles to San Luis Obispo, over rolling lands to the "Questra grade," two miles; thence eight miles over the mountains, good grade, to

San Luis Obispo,

With its 3000 inhabitants, situated in a cove at the base of the mountains, opening out to the west and south by a valley averaging two miles wide and 30 miles long, reaching from Cambria on the coast north to a point seven miles south of San Luis. Land worth from $20 to $100 per acre.

From San Luis we take the narrow-gauge railroad to Los Olivos, 60 miles south. Port Harford is on a branch of the same line nine miles from San Luis, our chief shipping point and the best harbor between San Francisco and San Diego.

Twelve miles south of San Luis is Arroyo Grande, a valley about one mile wide and five or six miles long, sedimentary soil of the richest kind. Squashes grow large enough for pig-pens. Beets and carrots push each other out of the ground, 30 tons of onions to the acre, with corn jumble thicker than canebrakes. Land worth from $250 to $300 per acre.

Thence eight miles to Nipomo, a new town of the boom order, some good land, mostly heavy adobe, surrounded with sandy hills covered with scrub oak; land values unsettled. Thence ten miles to

Santa Maria,

A town in a valley of the same name, and a river likewise, desolate and uncontrollable, a sand waste a mile wide and continually encroaching on its friable banks; some good land from $20 to $50 per acre; considerable town, with possibilities limited.

Thence 20 miles to Los Alamos over an indifferent country, mostly sand and hills. Los Alamos is situated in a nice little valley half a mile wide and three or four miles long. Land worth from $20 to $40 per acre.

Thence over rolling ridges covered with scrub oak 13 miles to Los Olivos, the present terminus of the narrow-gauge railroad. The valley surrounding the town is a beautiful one, half a mile wide and several miles long; deep and rather heavy soil, chiefly settled in small farms. Land worth from $20 to $80 per acre.

Thence by stage three miles over a rich undulating country, oak-timbered, to Santa Ynez, better known as the "College Ranch," owned by a syndicate; 30,000 or 40,000 acres, hill and vale, generally deep loam soil, claimed to be a good fruit and olive country, the only apparent drawback being prevailing northwest winds. Land, from $10 to $40 per acre.

Thence 15 miles over rollers, indifferently cultivated fields, then mesa lands, glades, hills, around bluffs, across streams, through gates, over big cattle ranches and lands of varying quality to a little red house under the great hill, where dinner was served with trout from the adjacent streams.

Thence six miles over rocks, around sharp curves, up narrow grades, through thickets, under live-oak shades, half-way up the mountain to

"The Hermits,"

A little house at a turn in the road—dense forests of live oak and witch hazel surrounding, filled with the murmurings of a dashing stream of pure water; a tall figure with woolen skirt and slouch hat in the foreground; bearded face, a high, broad forehead, with sad, expressive eyes that appeared to look backward on the past rather than to the future. "What shadows we are and what shadows we pursue."

Thence three miles to the top of the mountain, up-grade continually, narrow, rugged and rocky. Near the summit there is a great dawn of desolation; below, around, and to the northwest and southeast a hundred miles of

Rock-Ribbed Hills,

Brush and burning sands—emblematic of human life; the desolation that precedes the dawn of some new hope. Over the brow—then looking down, down 3000 feet we beheld the vale of Santa Barbara; beyond, the "gray and melancholy waste" of old ocean, with the large islands of Santa Clara and Santa Cruz sleeping on his bosom, 40 miles away.

Down, down, through gulch and canyon to the "Robin's Nest," a little wood-colored house on the hillside, with a garden and a few fruit trees below. Out of every door and window, and from around every corner, peeped a timid little olive-colored face—all girls of one Spanish couple, so numerous, it is said, that no one but their parents has ever been able to count them.

A drink to the weary horses and passengers, tendered by half-a-dozen of the larger of the multitude of little misses, having been received with thanks and a few nickels, the stage moved on down the steep grade, three miles farther, to the valley, averaging two or three miles wide and 15 miles long—with the ocean on the west and the precipitous mountain range upon the east—cut up into small farms, neat houses, well-tilled fields, chiefly set in fruit and nut trees, with Lima beans invariably intervening.

Santa Barbara.

Thence southeasterly, over two miles of low rolling hills, and Santa Barbara appears to us from the northerly end of State street, running through the heart of the city, 80 feet wide, paved with bituminous rock for three miles at a cost of $100,000 per mile. Its appearance reminds one of a dude with a long, wide, spotless shirt-bosom and his extremities indifferently clothed. Nevertheless it is a very attractive town of some 6000 inhabitants, and owing to the low hills to the northwest, the heavy mountains on the east and the high ridge on the west, coupled with the influence of Santa Clara and Santa Cruz islands, the climate all the year round can hardly be excelled anywhere under the sun. Boom prices for town and country property no longer prevail, but there is certainly nothing here in that line to give away unless it be the chunks of climate thrown in with your hotel bills. Twelve miles southeast of Santa Barbara is Carpinteria, a village of perhaps two dozen houses. The railroad runs near the ocean shore all the way, passing Summerland, where a big flow of gas has been struck recently.

J. V. Webster.

From Santa Maria.

Editors Press:—I see in my last week's Rural that the San Luis Obispo Fair managers offer a pipe organ to any couple who will get married in the Pavilion during the fair. This may be so, but I find no mention of it in their fair catalogue.

S. M. V. A. & S. A. Fair.

I send you by to-day's mail a catalogue of the Santa Maria Valley Agricultural & Stock Association's Fair, which does contain an account of such an offer made our society by the "Day & Fisher Music Co." of Los Angeles, and they also agree to give two musical concerts in the Pavilion during the fair. The star singers of the Angels City will be here. We consider this a very generous offer on the part of the Music Company, and worthy of public notice.

Our fruit, vegetable and grain display last year was pronounced equal to that of our county fair by all who saw it. (We were awarded a silver medal as a special premium on apples at the county fair.) Fruit culture is in its infancy here, yet it is thoroughly demonstrated that our valley is second to none on the coast for general horticulture; hence a great interest in tree-planting is everywhere manifest. Manufacturers and agents for farm and orchard machinery would do well to place samples of their stock on exhibition at our coming fair. The farm machinery now in general use is not suited to tree culture and will be in a measure displaced another season by sulky plows, orchard cultivators, etc. We have quite a number of young orchards just coming into bearing which will require fruit-graders, cutters, etc.

We also have fruit pests, and would like to know the best remedies and see methods of application demonstrated.

In other words, bring or send in your spray pumps, evaporators, cultivators and other devices for handling ground, tree or fruit, and I, as Superintendent of Pavilion, will guarantee that all will receive impartial attention.

One of the main features of our fair will be the races, and we boast of some pretty good horses. The running horses Comet and Moses B., of late Los Angeles fame, are owned here; also the trotters Electro, Saxton and others. A two-year old filly from Topsy is making rapid strides to the front. If you want to attend a first class fair and at the same time visit the coming fruit center, don't fail to come to our fair, Sept. 10th to 13th.

The Republicans hold their county convention here Sept. 9th. This will bring us quite a crowd and will take some of Santa Barbara's good citizens 90 miles from home. That isn't far for a Republican to go to serve his country, but it is quite a distance for a poor man to go to pay taxes.

Fruit Pests and Commissioners.

Our fruit-growers have recently organized a horticultural society here, with substantially the same objects in view as those of the Southern California Pomological Society mentioned in your issue of Aug. 16th. One of these objects especially interests us now; that is, "Efforts to secure proper legislation touching fruit pests." One year ago Aug. 1st our Board of Horticultural Commissioners was organized, and up to June 1, 1890, over 100,000 trees had been inspected in this district, and several old and badly diseased orchards were dug up and burned. The majority of our orchards were sprayed during the winter and spring, and badly infected trees disinfected or destroyed.

In the Lompoc district there were more than 25,000 trees inspected and much disinfecting done. In the Santa Barbara district they were simply eaten up with pests, but as the *Icerya purchasi* seemed to be the worst, having virtually killed the citrus industry, the commissioner devoted his time principally to propagating and distributing the *Vedalia*, and in six months had completely wiped out the cottony scale. Our Board of Supervisors had been commended by the press and the State Horticultural Society for their wise choice of commissioners and hearty co-operation generally, but they became weary of well-doing, and at their meeting in June decided to allow the commissioners but five days' work in each month. I had often heard it said that when men become tired of well-doing, we must look out for a brilliant spurt in the opposite direction; and we have it verified here! Just when the commission had got in good working order, with fair prospects of wiping out the pests entirely, they were told to devote no more than five days' time in each month to inspecting, which ends their usefulness. They can no longer inspect trees, clons, cuttings, plants, etc., which are being shipped in constantly; neither can they keep watch of fruit-stands, wagons, boxes, peddlers, and other avenues by which pests are brought in and scattered through the country. The whole kick seems to come from the southern district and from members who think more of the profits derived from selling climate than from products of the soil.

The truth is, the County Horticultural Commissioners are not under the proper authorities; they are supposed to be the working tools of the State Board and should be under its direct control. The destruction of fruit pests and guarding against their introduction is absolutely necessary in every county where trees are grown, and it is unfair for one county to go to the expense and trouble of disinfecting while another county is propagating a new supply. The State Board knows, or should know, the exact condition of things in every county, and with the power in its hands to appoint the necessary inspectors and quarantine guardians for each county, district or locality, it could soon materially better the existing conditions in most places by holding in check, if not entirely wiping out, the pests, which are fast gaining ground where neglected. The State Board could keep competent men in the field by paying them liberally and for their whole time. Then an inspector could afford to prepare himself for a life-work in entomology, but he will hardly do it for five days' work in a month at $3 per day and pay his own expenses! The fruit-grower cannot afford the time to post himself and keep posted on all the pests and diseases we have and are liable to have, owing to our climatic conditions. A competent inspector, who can warn him of the approach of danger, is a necessity and will be more and more appreciated as our country grows older.

Members of the Farmers' Alliance are talking this matter over. The next meeting of our County Alliance will be held here Oct. 7th, and I think they will have some demands to make of those who hope to gain their votes at the coming election.

O. W. Maulsby.

Santa Maria, Aug. 20, 1890.

Ventura Notes.

Editors Press:—I have thought perhaps a few lines from this portion of the State might be acceptable.

The fruit crop of Ventura county is very bountiful this season. Apricots have yielded from $50 to $300 per acre direct from the orchards. The nurserymen say there is again a demand for these trees. Prunes on the coast are shy bearers; but inland 16 to 20 miles, the trees produce heavily. This fruit has not had a just trial here, as all of the trees are comparatively young.

As far as we can learn, there has only been a small amount of honey gathered this season. Bee-culture is not given so much attention as a few years ago. Many have kept bees as a source of income until orchards or vineyards came into bearing. The orchardist finds that bees and fruit are not yoke-fellows.

Some inquiries are being made by Eastern capitalists about our available oil territory. Negotiations are pending for large tracts here, we understand. The oil interest is a source of income of which our county has but just begun to see the magnitude.

Improvements of all kinds are steadily going on in all sections in dwellings, roads, bridges, etc. The town of Ventura boasts a new electric-light plant. She takes her evening enjoyment within its ghastly glare. Her citizens are trying to secure a street-car line, which will be a much to be desired improvement. Glanders has made its appearance here; so far the inspector has ordered several animals shot.

The hot weather and lack of fogs will cause the Lima-bean crop to be short this season. In riding over the county one does not feel satisfied with the thin, sickly appearance of the bean-fields.

We have some lovely drives in this county. One of the finest is from Ventura to the Ojai. If you take the creek road you have a tortuous rippling stream beside, beneath or around you nearly all the way. The steep, high sides of the canyon through which you wind are a tangle of wild roses, and over the tall forest trees are hanging canopies of soft green grapevines through which even a vertical sun may not penetrate.

And then Camp Comfort, what a magnificent natural tent one finds—a tent of perpetual green. Those stately live-oaks have sheltered many a weary head in the past centuries. If one returns by the grade-road, how sublime the view of the wooded slopes and of many a yawning chasm and rocky gorge.

If the sun sets before you reach the valley, how you enjoy watching the sunshine creeping up the mountain-sides, pausing a moment on the top to throw a farewell to the purple mist below. The altitude and the shadows make the air chilly and you reach for the discarded hat and wrap. Later, you reach The Avenue—Ventura's boast—and bowl along for five miles on a level road which is kept sprinkled during the summer months and is lined with trees and pleasant homes. Straight before you is the sea, glinting in the moonlight; over all the shadowed drive is moonlight. When at last you reach home, how much you have to brighten the next day.

M. E. Dudley.

Ventura.

The Stock Yard.

A California Trail From Arizona.

E. L. Vail writes to the *Southwestern Stockman* of Willcox, Arizona, concerning a permanent trail from that Territory to this State, for which arrangements have been made among several of the leading stockmen of the Territory. He says:

"It is proposed to build a ferry-boat to cross the Colorado river; the plans for the same are now under consideration and the money subscribed to build it. Thousands of cattle have been driven over this trail, and though many years have passed since the Texas drovers traveled it, their old 'bed grounds' are to be seen everywhere after leaving the Colorado river. John Lang crossed the desert successfully with a herd of steers in January last, on the upper trail. We took the lower trail in March, as we were told there was more feed and water that way."

Mr. Vail also gives an interesting account of his recent experience in driving a band of cattle over the proposed trail, which we quote:

From Tucson as a starting point, the distance to the next watering-place (Charqua Yuma) is 18 miles, where water can be had at Molina's ranch; thence along the old stage-road to the Florence Canal is about 30 miles; at times water can be found in tanks near the road, and I have since been told by Charles Proctor that there is a better trail by passing to the southwest of Picacho Peak. We followed the Florence Canal to Casa Grande and the old stage-road to Maricopa. Here we watered our cattle in tanks along the railroad, which had been left by recent rains. If we had found no water there we should have gone to the Gila river, about 10 miles north. Before leaving Old Maricopa, which is four miles west of the present station, we watered all our horses and filled up our water barrels at a Mexican ranch. The distance from here to Gila Bend is about 50 miles, and there was no water on the way for our stock, but we made the drive in two days and one night, our cattle grazing well, and did not suffer much for water. The best place to water stock at Gila Bend is just above the ferry.

From Gila Bend we followed the old stage-road along the Gila to Yuma, swimming the Colorado river about five miles below Yuma. We found very poor feed on the Gila, as last summer was a dry one, and up to the time we passed the winter had been no better.

After crossing the Colorado river, we followed the river on the west side for about 18 miles, thence went south and westerly through some Indian villages to Willow lake, which is supposed to be in the bed of New river and the last water by the lower trail on this side of the desert. We could find no one who knew whether there was any water on our road this side of Carriso creek, and Mr. Turner and your correspondent, after an unsuccessful hunt for water ahead, returned to camp inclined to believe the Colorado desert as bad as it was generally reported. We were therefore greatly pleased to find that Col. D. K. Allen's surveying party had camped at Willow lake during our absence. The colonel gave us some valuable and accurate information regarding our route and the distances to the various lagunas on the desert, and reported feed good nearly all the way to Carriso creek. Colonel Allen is in the employ of the International Company of Mexico, having been about eight months on the Colorado desert exploring it in the interest of his company, and I doubt if there is a man living who knows the country better.

From Willow lake to New River Station is about 25 miles, the road running nearly northwest. Here we found water for all our cattle and good pasture. Our horses and part of the cattle had had water in a small tank about nine miles back.

Resting our stock one day here, we next drove to the Mesquite laguna, two miles north-

east of Indian Wells Station, thence to a large laguna which was discovered about seven miles northwest of Indian Wells. This lake was nearly half a mile long, and we saw a large flock of ducks on it. We left this lake about 5 o'clock in the afternoon and drove until 10 P. M; starting again at daylight next morning, arrived at Carriso about sundown.

Our cattle improved in condition from the time we left the Colorado river, as the feed on the desert was better than we found after leaving Red Rock. The lagunas found on the desert are the rain-water which collects in the lowest places, and is held for many months by the clay soil. In former years, during the high water in the Colorado, New river was filled with water which ran back into the desert as far as Indian Wells, but the great floods which occurred in 1882 (I think) left a bar in the mouth of New river, which has prevented the water of the Colorado from entering New river as it formerly did, and in consequence the old laguna at Indian Wells was dry when we crossed the desert.

Inclosed extracts are from a letter received from Colonel Allen, informing me that the bar in New River has been broken or a new channel opened by the floods of last month.

"Glad to know that you succeeded so well in your work with the cattle. We saw your dust for two or three days—at least my men did. I did not believe that you would have any trouble in finding water. You ought to see that same country now. From Haul Hanlon's, just below El Rio, the first station west of Yuma, for 40 miles, the whole country is under water from two inches to 3½ feet. Right where you watered your cattle near our camp, I came over the land with a boat last week. Animals have to swim all the streams (arroyos) to Indian Wells. The whole country will be a lake—in fact, it is all a lake.

"Probably for the next two years there will not be much difficulty as to feed and water on either of the roads or trails from Yuma west across the Colorado desert. As a general thing, I believe the supply can be depended on for 1000 head of cattle from November till April. The two best and surest places to dig wells, if necessary to do so on the road between Algodones and Carriso creek, would be at Seven Wells and Indian Wells, provided the feed is as good as I think it will be after this flood. This is on the north trail. On the south I should try the mesquite lowlands nine miles west of where you camped near us, and Alimo is 15 miles northwest of there, where I think water can be had without digging very deep."

Fruit Preservation.

The Use of Sulphur and Zinc in Fruit-Drying.

EDITORS PRESS:—I inclose herewith a letter lately received, which has been called out by the Bulletin treating of the sulphuring of dried fruits issued not long ago by this department.

The writer treats of a phase of the subject that I left untouched, partly because the use of "galvanized," that is, zinc-covered drying-trays, is not as common with us as it is in the East, where the evaporation of fruit juices in zinc-covered evaporators has already caused much comment and animadversion. Many years ago I had occasion to battle against the use of zinc churns and churn-dashers, which were specially recommended for making the butter come quickly; it *was* gathered more quickly by the zinc salt dissolved in the buttermilk. It may not be amiss to call attention to the fact that fruit-trays made of "galvanized" *wire netting* stand on precisely the same plane as the evaporators made of zinc-covered sheet-iron, and that preserve kettles made of that material are nothing less than poison pots. Many so-called dispensations of providence in the way of dyspepsia and other disorders of the digestive organs may be traced to this pernicious practice of imbuing fruits and other edibles with solutions of metallic salts. I think the warning given in this direction by Dr. Smith's letter is well-timed in this State as well.

Permit me right here to answer a criticism, reproduced by several papers, of a statement made in Bulletin 86 of this Station. It was asked how, when objecting so strenuously to the use of burning sulphur for bleaching fruit, I could consistently recommend a solution of sulphide of soda, which contains the same compound—sulphurous gas—which is set free promptly by the acid of the fruit and so exerts its bleaching action.

To this I reply that the strength of the solution recommended is a definite figure, not easily exceeded by any tolerably reliable workman, and is totally insignificant when compared with the varied and often extravagant amounts used in the sulphur-box. If it were true in practice that the sulphuring is done only to "set the color," as my objector says, it would be a very safe thing, but once light the sulphur-pan and there is no telling how far the caprice or neglect of the workman may let it go. Nothing of the kind can happen if the fruit is dipped once, before drying, into a solution of definite strength; that also "sets the color" to a somewhat darker shade than sulphuring in the box, but satisfactory to any reasonable purchaser, and with no perceptible injury to the flavor of the fruit. The reason for this advice is therefore a thoroughly practical one, even if given by a "professor."

E. W. HILGARD.

Dr. Smith's Letter.

Prof. Hilgard—DEAR SIR: To-day I have read in "Popular Gardening" your views as there given about "sulphuring," or the bleaching of dried fruits. It is a subject to which I, as a medical man chiefly, have given no little research, and think I called attention to the objections to it before any one else—at least, so far as I know—several years since.

Your paper seems a good one, yet not so clear or full and explicit in some things as I could wish. I have not time to write very much. Evaporated fruit is better than most sun-dried, but it should never be bleached or tampered with. The God-given flavor and color of honest drying is all that is ever safe or proper.

Sulphate of zinc is the most common poison found in the bleached or sulphured fruit, and now nearly all large evaporators sulphur all the fruits they dry. The most of them use zinc-coated or "galvanized" trays to hold the fruit. Burning sulphur forms sulphurous acid, and the air and moisture in the evaporator, and perhaps aided by the heat, changes that into a weak sulphuric acid; and that, acting on the zinc, produces the sulphate found in all fruit thus evaporated. Dr. Peter Collier of Geneva, N. Y., Experiment Station, found it present to the amount of 2½ ounces to each 100 pounds of fruit, or 12 grains of "white vitriol" to each pound of fruit. That is enough to impair the flavor and prove injurious, as he says, if used in considerable quantity.

Better not tamper with a practice that is so dangerous and likely to make intelligent people afraid of dried fruits. The fruit industry—and a large one, too, is in great danger if the bleaching and all other sophistication of the most healthful of foods—preserved fruits—is not soon stopped.

JOEL W. SMITH, M. D.

Charles City, Iowa.

In a City Cannery.

A *Chronicle* reporter was conducted through the Lusk cannery on Brannan street recently by Mr. Sewall, the superintendent. Here, as in the other packing-houses, more fruit is being put up than in any previous year, some 750 women being employed in peeling, coring and canning. Very little talking was being indulged in, the women and even young children down to 10 or 12 years old all being too busily employed to stop to talk. The children easily make 50 cents day, Mr. Sewall says, if they stick to their work. The fruit is pared and cored and then washed in large troughs of clean water. Then each can is crowded full and marked with the grade of fruit. The can until this point has the large circular opening in the top, through which it is filled. The cans are placed in racks holding several dozens, the racks being mounted on cars which bring them to the right hight for convenient handling. They are then wheeled to the syrup tank and filled with syrup, about 300 to 350 pounds of sugar being used to a ton of peaches. The little caps, each with a small hole in the center, to cover the circular openings, are next soldered on with an apparatus by which a large number are handled in a minute. The truck on which stands the rack is then passed on to a tank full of boiling water, in which the rack, cans and all are immersed. The hole in the cap is so small that no water enters and none of the syrup comes out.

Next the rack full of cans is replaced on the truck and passed on to the second solderers, who deftly deposit a drop of solder on the hole in the cap. To make sure that no live germs of decomposition are left within, the cans are again immersed in boiling water and are then ready for packing, in which is included the placing of the proper label and boxing. The syrup is used only to make the fruit palatable and not for its preserving effect, heat and hermetical sealing being depended upon for that.

The cans are made by machinery in the upper story of the building and come rolling down in a steady stream, during working hours, along a railway built for the purpose.

Apricot Pitters.

EDITORS PRESS:—Now that the apricot season is over, will not some one tell us about the small pitting machines, the cost of using them as compared with pitting by hand, their adaptability to fruit of various sizes and conditions, etc. D. M. DIMMICK.

Carpinteria.

[The suggestion is a good one. It was announced recently that the Rogers pitter was doing well at Los Gatos. We would like notes on various devices.—EDS.]

The Stable.

Eastern Experience in Raising Colts.

Mr. J. J. Woodman gives his experience in an interesting way, and though worked out under Eastern conditions, may prove in some respects suggestive on this coast. We quote as follows:

Of course it is understood that *I* am raising colts and horses for the money there is in them, and therefore endeavor to raise them with the least possible trouble and expense, and still have them cared for and grown well enough to readily sell at a reasonably fair price. I raise both spring and fall colts, and think I can raise the latter easiest and cheapest, especially from work mares; besides, by having rye or other early green feed for them after being weaned, their growth is not checked nearly so much as is the case with colts weaned in the fall, which must of necessity subsist on dry and artificial food for several months. I do not usually allow my spring colts to follow their mothers when they are at work, but turn them into a box-stall with oats and water where they can help themselves or turn into a field with some older colts they are acquainted with, where they soon learn to run quietly between meals. I usually halter-break them by tying beside their mother for a few days while doing some moderate work, and find it much easier than wrestling with them after they become older and stronger. I prefer not to wean spring colts until cool weather comes in the fall, generally in October, and find that they winter better than those that I buy and am forced to take earlier. I find it much harder to keep colts growing and thrifty the first winter than afterward, and feed them corn, oats, bran, middlings, roots, if I have them, with plenty of good hay; and usually fail to grow as fast or look as well as I wish them to. We do not tie weaning colts, but turn them loose into a warm box stall, and find it easier and more quickly done. I kept eight head last winter in a stall 14x16 feet, and they got along nicely together; we turn them out pleasant days, and feed cornstalks in the yard at noon. If cold and stormy, we leave them out long enough to drink and have a little play, then put them back and water again at night.

We frequently see weaning colts turned out every day, warm or cold, wet or dry, to stand shivering all day in the fence corners; their owners expecting them to grow flesh, muscle and bone from exposure to the elements, and we usually see that they grow more bones than anything else. I am practicing sowing winter rye early in the fall for early green feed the following spring, and consider it a most excellent plan. We plow sod or stubble only deep enough to turn over, and sow rye on the furrow at the rate of two bushels to the acre, and drag over once thoroughly. My idea is to do the work as quickly and cheaply as possible; besides, when plowed shallow, say three or four inches, the land is not punched up so badly by colts in early spring, while still soft, and by plowing the usual depth the next time, the sod, weeds and stubble are kept beneath the surface. I pasture the rye usually until after corn planting, which gives clover pastures a chance to get well started before being fed. The rye acts as a laxative for the colts, rids them of worms and starts them to shedding their old hair; so that when turned into the clover they are in good shape to grow right along, and the rye-fields are in the very best condition to turn over and plant to beans. I feed no grain while colts are on pasture, and hardly think it pays in the long run to do so. The winter after my colts are a year old, I usually tie them in stalls, using five-ring halters and tying them short; feed them straw mostly, with a fair amount of grain, with hay or corn fodder at noon, fed in the yard if pleasant, and in the barn when severely cold or stormy. By putting something they like in their feed-boxes when out of doors, as an apple, ear of corn, handful of oats, or a little salt, they quickly learn to come in and take their proper places when the doors are opened and they are called, which is much easier than trying to drive them in with a club, and less strain on the temper. The winter after they are two years old I feed them about the same, except, perhaps, giving them a little more straw, and usually harness and drive them a few times as I may have time.

I have, so far, sold more at this age than any other, and believe it to be the best and most profitable age to sell at, and also to buy at, if the purchaser wishes them for immediate work. Some one may ask why I feed straw so much, and I will explain by saying that when I feed with a fair amount of grain, I can make them grow and look reasonably well after they are one year old. I usually raise a good deal of hay, but make it a practice to feed out the straw first. I have raised millet a few times, and have found it when cut early, well cured and fed with straw, an excellent food to help out with. I have never fed oilmeal to any extent, but have found middlings excellent. For several years have raised beets, which make good food when it begins to get warm in the spring; colts and horses usually eat them readily, and a large amount can be raised on a small piece of ground. Have also raised turnips and carrots, but prefer beets to turnips for feeding, and carrots require too much labor for the bulk produced per acre.

When a colt does not eat corn well and has lampas, instead of burning down the bars of the mouth I feed soft food for a few days. When I notice a colt's eyes running I look for a chaff in its eye or a bruise outside, and let its wolf teeth alone. In fact, in raising horses one needs to use a good deal of common sense and judgment, even if it is not in exact accordance with whims we may have heard from childhood up.

As to the profits of horse-raising, from experience I am fully convinced that the same feed and care that will grow a steer old enough and large enough to sell for $50 will grow a colt that will sell for $200, and believe I can keep a colt nicely on the same feed that would keep five sheep, with even greater profit in favor of the colt.

The Vineyard.

Judge Stanly's Experience with Resistant Vines.

Hon. John A. Stanly, whom our readers already know through accounts of his progressive work in dairying, land reclamation, vine-growing, etc., has written a letter to W. B. West of Stockton, upon points suggested by Mr. West's first letter to the RURAL upon resistant vines. The letter is printed below by permission of the writer and recipient:

Judge Stanly's Letter.

W. B. West, Esq., Stockton, Cal.—MY DEAR SIR: I have just read with great interest your communication "Number 1" upon "Resistant Vineyards" published in the RURAL PRESS of this week. I trust that you will succeed in arousing in our viticulturists a proper interest in this matter.

The object of this writing is to express to you my experience of this year as to the bearing quality of vines grafted upon resistant (Riparia) stock. Heretofore, with an experience of but four years, I had about made up my mind that vines so grafted would *not* produce as well as French vines grown upon their own roots, and had roughly calculated that the grafted vines would probably yield 20 per cent less than the same varieties would on their own roots. But this year all this seems to be changed in my vineyard. My grafted vines now bear a crop very much in excess of the same varieties, which I have had an opportunity of observing, which are growing upon their own roots.

This is especially so in the case of the Zinfandels, Mataros and Tannats. Is it possible that the root system of the Riparia is so much more vigorous than that of the Vinifera as to make the grafted vine more productive?

That this root system of the Riparia is more vigorous than that of the Vinifera seems to me to be established by the fact that the Riparia (ungrafted) produces more numerous and longer extending canes than I have ever seen in the case of viniferas of the same age, and this upon the hypothesis that the root growth bears relation to the cane growth.

I beg your attention to another observation which I have made this year and which may prove of value. The grape crop this year in Napa is said to be very light; the grapes are said to have suffered from coulure and heat. My vineyard has so far been absolutely exempt from this complaint, and to the contrary bears such a large crop as to make me a little uneasy as to the *quality* of the wine to be produced from them. My vineyard is, as you are aware, in the lower part of Napa valley, where the summer climate is very much mollified by the saline air of the bay, and to a superficial observer this difference of climatic conditions might afford a reason for the exemption of my vineyard from the effects of the heat or whatever cause may have produced the shortness of the crop in the upper valley. But this difference in climate does not account for the difference of crop, as is demonstrated by the fact that the vineyards of my neighbors, having the precise climatic conditions of my own, are in the exact condition of shortness of crop as those vineyards higher up the valley. My vineyard is on resistant roots and my neighbors' on vinifera roots. Is it possible that this fact can account for the exemption of my vineyard from the causes which have produced the shortness of the crop of my neighbors, and of the vineyards in the valley generally?

I express no opinion upon this question, but give you the facts in the hope that your longer experience and more extended knowledge of such matters may enable you to answer the question.

You did me the honor of paying my ranch a very hasty visit a few years since, and if your engagements would admit of your doing so, I would be very glad if you could repeat this visit this year before the coming vintage, and before you conclude your contributions to the RURAL upon "Resistant Vines." Truly yours,

JOHN A. STANLY.

[Mr. West considers the above record of experience of much interest. He remarks in handing us the letter for publication that he considers coulure and heat effects as due to climatic conditions and not to root influences, except that a young vine with a strong root may resist adverse climatic conditions a little better. It should also be noted that Judge Stanly cultivates his vineyard well, and that is another means of insuring strong vines.—EDS. PRESS.]

Eastern Grapes on Our Southern Coast.

EDITORS PRESS:—I would like to inquire, through the PRESS, relating to the raising of the more hardy varieties of Eastern grapes—for instance, the Concords, Delaware, or Martha—in this locality. Why are they not raised in Southern California? Providing the conditions of soil were favorable, what other drawbacks are there aside from the fogs? Prevailing winds here are from the west, with occasional eastern gales in fall and spring.

Hueneme. H. S. HARVEY.

[Some of our readers resident on the southern coast may give us an interesting letter by describing their experience with these varieties.—EDS. PRESS.]

PATRONS OF HUSBANDRY.

In our Rural Press [illegible] issued every week, will be found [illegible] matter from this and other jurisdictions, of interest and importance to Patrons. Any subscriber who wishes can change free to that edition.

Pull Together.

Some Grange readers south want to know what the RURAL thinks of the Farmers' Alliance.

While we cannot yet tell so much about it as we may be able to later, we believe this new farmers' organization is on the eve of doing a "powerful sight" of good. It has our best wishes for true success. If the costly lessons of experience the Grange has learned in 21 years are worth anything to the Alliance, every true Patron should freely lend a hand and help along those who are traveling our way, whether they drive a single or double team, or foot it a part or the whole of our road. Why not? Why should one fraternal society (any more than a church) do otherwise than say God-speed to all other deserving organizations? May we not yet hitch teams to advantage, at least in hard places?

A Gala Day at Watsonville.

Saturday, Aug. 23d, was truly a gala day for Watsonville. At an early hour scores of teams, loaded with provisions and happy Patrons, might be seen coming from all directions to the Opera-house, the Grange headquarters for the occasion. The artistic Overseer, Bro. A. N. Judd, with his superb committee, had embowered the stage with vines and flowers, while sheaves of golden grain, from which gleamed half-concealed sickles, with agricultural implements appropriately decorated, presented a beautiful farm-scene seldom witnessed. The tables were—but oh, pshaw! "Pity without relief" is useless, so why tantalize? Suffice it to say that Bro. R. Barland and his energetic committee received encomiums from all, while Bro. C. Porter and committee's coffee was voted A No. 1.

After banqueting the body, the talented Lecturer, Sister A. Bowman, presented a feast to the soul through a splendid program. Exercises were begun with an overture by the Grange Orchestra, or Bowman's Band, led by Dr. Cargill and assisted by C. and W. Bowman, F. Hitchings and Miss Pearson, a pianist and graduate of the Conservatory of Music at Boston. During the exercises this accomplished lady rendered an original musical composition in so artistic a manner as to prove her a genius of harmony. She is temporarily visiting our valley for health and observation, and our music-loving people might, perhaps, induce her (as she is much pleased with the Pajaro) to give courses of instruction in music, both instrumental and vocal. Miss Childer's piano solo, "Drops of Rain," was true to nature. The music throughout was said to be the best heard here for years. Little Lima Bixby captured the audience by her sweet song, while Mrs. Struve's address of welcome and Mrs. Tate's essay were well received. Miss Moliere, a true disciple of the great Delsarte, who has of late freely bestowed her time and talent for the education and amusement of our people, favored the audience with "Money Musk;" being roundly encored, she responded with a selection from Shakespeare, so powerfully as to stamp her a gifted elocutionist and queen of tragedy.

Among the visitors were three of the State Grange officers—the silver-tongued Master, E. W. Davis, the "Old Man Eloquent," P. M., I. C. Steele, and the inimitable young-old man, Treasurer C. J. Cressey—all of whom gave admirable addresses.

Much credit is due the entire Grange for its hospitality and good management, and to none more than to Bro. and Sister J. C. Drew, while Bro. and Sister Uren rendered valuable assistance.

The "Big 40" class was in charge of Sister J. A. McCune and Bro. Hitchings, who marshaled them with ability and skill.

After the meeting a large number of applications for membership was received and (contrary to intention) amid all our other work, another large class will be pushed through with dispatch before the meeting of the State Grange.

Thus ended another day which proved both a credit and a pleasure to all participants, and shows plainly how good it is for farmers to meet together in unity, peace and friendship.

A. P. R.

THE FARMERS' MOVEMENT is a natural outgrowth of the times. For years this most important class of the population has been outrageously robbed. They have borne their wrongs with too much patience; but now they are turning on their oppressors, and it will be a sorry time for the blood-suckers when the votes are counted next November. Let the farmers and industrial classes generally concentrate on Legislative and Congressional candidates, and they can secure what they want. Vote only for the men who will carry out your principles.—*Cincinnati Enquirer.*

The Master's Desk.

E. W. DAVIS, W. M. S. G. OF CALIFORNIA.

Farmers of California, remember how you have to delve and sweat to earn the money to pay your State and county taxes. Remember this fall brings a general election, and let me say to you now, before the heat of the campaign is on, remember to vote for men who will appropriate less of public money. Taxes are too high. There is no sense in such extravagance. No farmer can afford to pay the present rate of taxation. Bankruptcy is sure to follow unless taxes are reduced. Remember!

Be vigilant, Patrons, for the politician is about seeking your vote and taxable property.

The Executive Committee of the National Grange and the Executive Committees of the Pennsylvania and Virginia State Granges were to hold a joint meeting at the Interstate Grangers' Picnic Exhibition, which comes off at Williams' Grove, Penn., August 20th to 30th. This is a step in the right direction. This is meeting together, talking together and working together.

Brother H. E. Hayes, Worthy Master of the Oregon State Grange, and other prominent Patrons from our northern sister State, are expected to be present at our State Grange session in October. Come, brothers and sisters of Oregon, don't wait for special invitations. Our Patrons will all be glad to welcome you to our annual conclave.

Only a little more than a month till the meeting of State Grange! How many new Granges are to be organized before then? Deputies should lose no time in preparing for the session.

Now is the time to get your blanks for the railroad agents to sign, so you will be enabled to get reduced fares to the State Grange. Don't forget the blank. Call on Brother Dewey for it if the Secretary of your Grange cannot supply you.

The Trade-Card Plan is worthy of your consideration. Has your Grange taken any action on the subject? Don't say the Executive Committee has not proposed something tangible in the way of business. If you know of a better plan to help the farmer, propose it at the State Grange.

The charter for Waterloo Grange has arrived, and has been duly signed and forwarded.

One by one the links of that strong chain—the *farmers'* chain, the Grange—are being welded. During the past six months there have been, on an average, two new Granges every day. Does it seem to you that the Grange is not growing? Does it impress you that the farmers are not organizing, and that they do not appreciate the power and influence of the Grange? To me it seems just the reverse.

When Faith, Hope and Charity are prompted by Fidelity, then, indeed, is good sure to follow; and remember, the Grange exercises Faith, Hope and Charity, and does it in (Good Faith) Fidelity to all mankind.

When you go to the garden to get a flower, you select an opening bud, or at best a half-opened rose. So, when you select the flowers of the community—men and women—for the Grange, get those who are full of promise; get those who will help and be helped, who will suggest and receive suggestions, who will work for the Grange and be profited thereby personally. Such we want and need.

Encourage your son to earn $3, and when he has earned it, advise him to join the Grange. Membership in the Order will pay him a better dividend than any corporation stock in the United States. Parliamentary law, education, art, science, music, morals, manners and true manhood are always valuable property. These the Grange has to give to any inquiring, attentive, studious young man.

"Not all that glitters is gold." Half of the sweet words that are spoken are not meant. How important, then, when one finds a *true* friend to fully know that fact, and knowing it, to make your friend know it also. Then, indeed, the kind word *is* fitly spoken.

Strive to make *your* Grange the most instructive, the most attractive, the most popular one in California. Then will the attendance increase, the membership grow and the Order be profited.

Remember every leaf on the tree or plant has its use and a duty to perform. So every member of a subordinate Grange has a work to do and a duty to discharge.

Study the true doctrines of Government and you will be more than a partisan; you will then see the need of protecting home and country, and that beats any and all party politics.

Love thy neighbor as thyself, and at the same time forget not that the Grange is the best place to meet neighbor and to discuss those questions that interest all farmers alike. Don't underestimate the Grange!

From Tualitin Grange, Oregon.

EDITORS PRESS:—Tualitin is not dead, neither is she sleeping, that her correspondents have been so derelict in duty; but rush of farm work, cares almost innumerable, which weigh heavily at this season on the farmer, his wife and children, prevent the pen from performing its duty.

No, our Grange members are faithful, our meetings full of interest, and occasionally we add to the number of those who strive to aid us in our work.

The Grange's Opportunity.

When we realize what the Grange might be, what it would be were all its members fully aroused to a consciousness of their duty, each feeling his or her own individual responsibility, working together with enthusiastic determination—working mentally as well as physically—we wonder why the wheels of reform do not roll more rapidly, bringing with every turn the glad tidings of progress in the cause of America's suffering people; for although we claim freedom for our country, is it really ours while the fact is clearly demonstrated that millions of our people are bound as with an iron clasp and pray to be relieved? Whence is relief to come? Only through the education of the men and women of our land.

Cannot the Grange do its full share in this ennobling work of educating the laboring classes, that they themselves may be able by earnest, united, unflinching effort to pave the way, thoughtfully and peacefully, but steadily and surely, to a condition of freedom from servitude and from the shackles of oppression? May the time be not far distant when both men and women shall understand the laws which govern them, and keep in check the elements of corruption which are found even in the highest official stations of our so-styled free American Government!

Sister C. E Kinney, in her "Communication to Sisters of the Grange," strikes the keynote of success in Woman's department, and would every Grange in the nation adopt the plan therein suggested, the social and educational standing of the woman of the farm would be so improved that no other class could excel them in useful lore, or lend more helpful aid in the great movement which agitates the minds of the multitudes thoroughly aroused to the necessities of the present age. How plainly she shows the importance, the utility, the beauty of our work, and the ignorance of the majority of women, both in country and in city, in reference to the laws of their own State.

Sisters, let it be not long *said* of *us*, should we be called "to stand alone," that in default of a business education we "are at the mercy of unscrupulous men!"

Brothers of California, Oregon and Washington, will you not encourage and assist the women of your Grange, that they may keep "mentally abreast" and "be the strong allies and counselors whom our Order needs in this crucial struggle for justice, competence and a type of life worth living on the farm?"

Sister Kinney's letter is deep and practical, and merits the thoughtful attention of the Grange. May its suggestions be of untold benefit to our Order, is the wish of yours fraternally,

S. L. HAYES.

Oswego, Or., Aug. 19, 1890

Eureka, Magnolia and Grass Valley.

EDITORS PRESS:—Eureka Grange has been moved into Auburn, where they think that they can do better and get more members than they would at their old place of meeting.

On the 23d instant, wife and I went by rail from Marysville to Lincoln. At the latter point we procured a livery team and drove 16 miles across the country to Auburn, where we found a goodly number of the members of Eureka Grange assembled at the Grange hall. As soon as we entered, they came forward to greet us with true Patrons' hospitality; and presently the Grange was called to order, and by request of the Worthy Master, I took the chair and conferred third and fourth degrees on a class of four—two brothers and two sisters.

After the degree work was finished, we were invited to take seats at the table prepared for the occasion, and to conclude the fourth degree after the inner man had been satisfied. I gave them a good talking-to on the Good of the Order and what they should do to make theirs a live Grange.

Bro. Hall of Newcastle was there; also Bro. Still of Magnolia. The latter has made arrangements for me to visit Magnolia Grange on the 11th of September, and I hope to see as many Grangers as possible present there and then, as it is a long trip for me and it takes three days and considerable expense to make the visit. So I want a good turnout of the Grangers in that vicinity.

I sent word by Bro. Still for Grass Valley Grange to meet with Magnolia on that day, so that the one visit would do for both Granges.

Fraternally, B. F. FRISBIE.

Yuba City, Aug. 25, '90.

MARCH GRANGE.—Bro. W. T. Lam, W. M. of March Grange, made the RURAL a friendly call the first of the week, and brought cheerful news from Pennington. He says they initiated three new members last Saturday, have more in prospect, and will be represented at the State Grange this year for the first time since their organization.

Timely Thoughts for Farmers.

An Address to the Grangers of Santa Barbara County

[Delivered at the Carpinteria Grange Picnic, Aug. 14, 1890, by J. V. WEBSTER, P. M. C. S. G.]

Worthy Master, Patrons and Friends:—I have often heard of Carpinteria valley. Brother Cadwell never fails to give a favorable impression of it wherever he goes.

Colonel Heath, while at my house some two years ago, praised your climate and your soil, declaring that all land here suitable for walnut-growing was intrinsically worth $300 per acre unimproved.

The picture of its loveliness has not been overdrawn. The sea and the land intermingle but a little distance to the west. Through the enshielding hills the warm currents are kindly tempered to the fortunate dwellers of this delightful region.

This Santa Barbara link in the golden chain of California counties is not less bright and enduring than those formed by her most favored sisters. To the close observer, every spot visited but adds to the charms of our beloved State. In Santa Barbara you have had a boom. Nearly every town south of this has had one. Many people of the colder counties and countries accuse you of exaggeration as to your climate and possible resources. The same is said of your sister counties farther down the coast. If so, it is like the youth who expatiates on the beauty and perfection of his mother, for no sentiment is higher or holier than love for our great Alma Mater.

It needs no prophet to divine the probable future of this coast; as yet we are but just beginning to gather the bright pebbles along the shore of a boundless ocean of beauty and wealth.

The earth is girdled with restless, ever-moving humanity, always seeking the unknown and thirsting for the unattainable. So it has ever been, and so it will ever be. Spots have been found upon the globe so enchanting in position, climate and resources that people of all nations cluster around them like ants about confectioneries.

Be satisfied! The last found is certainly the best. Worship the brown soil of your fields. Love and cherish it as you would an indulgent mother. It is not yours, but simply given in trust for the millions yet unborn, and he who wantonly impoverishes or destroys an acre of land is worse than a vandal. Take pride in your productions. Endeavor to add continually to the charm and comfort of your surroundings, and a wealth of beauty and utility will be developed in California yet unequaled in all the world. Then seekers after health, wealth, pleasure and solace will turn to you, as turns the morning-glory to the rising sun, that life may be sustained and strengthened.

God may shower His blessings upon the earth, but their disposition is left in the hands of men; and to the thoughtful, the chief element in the religion of the future will be the love of Nature.

That we or our children may realize the full fruition of this thought, every citizen has a sacred duty to perform.

Stability and Security of Government

Are indispensable to this development—a Government wherein is secured the greatest good to the greatest number. This end can only be attained by an unbiased and watchful care upon the part of every one in the full discharge of every duty devolving upon all worthy citizens.

The weak must be sustained and the strong restrained. Blind party following must have an end, which can be reached only by a more liberal and intelligent public sentiment.

We complain of many wrongs; some of them are oppressive and discouraging. The farmers of the nation are especially concerned in having them righted.

Combinations

Are the order of the times, and always against the political or material interest of the producers. To offset this tendency, we must meet organization with organization, and there is certainly no time for delay.

These wrongs and exactions come chiefly through the tax gatherers, trusts and transportation companies, and have shown unbearable. The agricultural interests of the Atlantic States are paralyzed. Farms are being abandoned by the thousand. The great Northwest, with her granaries filled to overflowing, mourns in anguish over the fitful profits allowed them by the common carriers. A few railroad magnates and trusts appear to hold the financial destiny of the country in the hollow of their hands. Their dictation is commercial law, from which there appears to be no appeal.

"All the Traffic Will Bear."

To extract from every product for its carrying "all the traffic will bear" is the declared principle and practice in railroad operating; in other words, to extract every cent obtainable in the form of freights and fares.

Is there any remedy for this evil? We complain of hard times. What is the cause? Is it altogether because of the limited amount of money in circulation? Or does not our embarrassment chiefly arise because of unjust exactions?

It is not so much our earnings as our savings which induce prosperity. If the legitimate profits of our toil are taken by excessive taxes, trusts and transportation companies, an additional money circulation will not materially relieve us.

Can we not reach a conclusion as to where the bulk of our profits has gone?

Let us see. The estimated value of all railroad property in the United States is about $8,000,000,000. *Eight thousand millions of dollars!*

Equal to 500,000,000 pounds of silver! *Two hundred and fifty thousand tons*, and would load 50,000 cars with 10,000 pounds each, and make a train 580 miles long. Reduced to gold, it would make 31,250,000 pounds, or 15 625 tons, and would load 3125 cars with 10,000 pounds each, or would make a string of $20-pieces reaching from San Francisco to New York, thence across the Atlantic Ocean to Liverpool, and then have sufficient left to build a golden palace. In fact, this $8,000,000,000 of railroad wealth represents more money *than the aggregate assessed value of all the farms in the United States*—less the mortgages and other incumbrances thereon—and a value equal to the net receipts of all the products raised since railroading became a prominent factor in the carrying trade!

This estimate will give you some idea of the vast wealth accumulated by a comparatively few men within the last 40 years. Seven-eighths of this amount is represented by gifts of the Government, State, county and municipal donations, coupled with the unjust exactions from the people, in the shape of extortionate rates of freights and fares.

With this condition of things existing, is there any wonder that the agricultural interests of the State and nation are depressed? What wonder is it that mortgages are continually piling up on our farms? What hope is there of the country's prosperity, when the principle in railroading prevails everywhere, as expressed by Leland Stanford 15 years ago, that the policy was, and is, to extract from every product for its carrying "all the traffic will bear." In other words, to take every cent which can be extracted from every product carried. Is there no remedy for this evil? Many have been proposed and subsequently found to be unavailing. Legislation, fixing rates of freights and fares, has been tried and failed. A few years since, State railroad commissions were thought to be the proper thing. This experiment has been abundantly tried, with unsatisfactory results.

The United States railroad commission has done something in a general way, but the root of the evil will never be reached by any method yet adopted. Nevertheless, regulation and control we must have, or abandon all hope of agricultural prosperity for the future.

How shall we secure it? That is the burning question which transcends all others.

It appears to me that there is one possible solution of the difficulty. That is, for the Government to condemn, appropriate and operate a sufficient number of railroad and telegraph lines to regulate and control the traffic.

The Nationalists

Declare in favor of the Government condemning and appropriating *all* railroad and telegraph lines, to be operated by Government employes.

Monstrous conception and dangerous beyond precedent! Put it in practice and republican government in this country will speedily come to an end.

A million and a quarter of men are at present required to operate the railroad and telegraph lines in the nation. This vast number of voters, appointed to positions by any party under Heaven, would make them the friends and allies of the appointing power. This is simply demonstrated human nature, and there is no escape from the inevitable conclusion. Self-interest would subsequently carry them with the party of their appointment. Consequently, this element would hold absolu ely the balance of all political power, and from their dictation there could be no appeal, short of revolution. An oligarchy in governmental affairs would then control the destinies of a great people, ultimately culminating in centralization, with a single head in the lead.

Certainly, we are sufficiently near this line of danger at the present time; certainly, the rich and powerful have already a sufficiency of power, and every increase in this direction certainly decreases the chances of republican government on this continent.

Any government to be enduring must be able and ever ready to protect the rights of its subjects. Robbery under the forms of law is the most dangerous and demoralizing of all robberies. Therefore all laws should be just and strictly enforced.

I am opposed to the Government engaging in any business inimical to individual enterprise, where avoidable, but it must have and exer cise strength sufficient to regulate and control a crying evil.

Two lines of railroad and two or three of telegraph across the continent, under the direction and control of the Government, will be sufficient for the purpose.

The Pacific Railroads.

From San Jose to Omaha, the Central and Union Pacific roads equitably belong to the people. Having totally failed to comply with the terms of the Congressional Acts under which they were created and endowed, their lease of co porate life should not be extended, as proposed in the refunding bills now before Congress.

The Government should, therefore, condemn and take possession of said roads, and in conjunction therewith condemn, pay for and appropriate a continuation of the line to Boston via Chicago and New York; then, in the same manner, take possession of some other line from, say, Richmond, Virginia, traversing the Southern and Gulf States, via the "Sunset route" to San Diego or San Francisco.

Rates of freights and fares, fixed and maintained by the Government, on any two such roads, would substantially regulate and control the carrying trade of the whole United States, by compelling every other road to adopt, substantially, the same rates, or become simply feeders to the Government lines.

So with the telegraph lines indicated.

That this plan will be the ultimate result of the controversy appears inevitable, for there seems to be no other practical solution of the embarrassing situation, and public opinion is certainly drifting in this direction.

In order to divert popular attention from this and other vital questions, every cunning device conceivable is being used.

The Sub-Treasury Scheme,

Recently advocated before the Ways and Means Committee of Congress, is of this order; so with Senator Stanford's proposition to loan money by the Government directly to the farmers at nominal rates of interest. Many worthy people have been led off on these tangents. Wall street and other money centers are aiding to stuff these bubbles, in order to divert attention from the consideration of practical and vital questions.

Certainly we need more money. $1,300,000,000 are all we have in actual circulation in the United States, or about $20 to each inhabitant. In 1865 we had in circulation $31 for every man, woman and child. We need at least that proportion now, in order to successfully conduct the business of the country and enable the debtor class to meet their obligations. To meet this emergency, farmers all over the nation have been urging Congress to pass an Act providing for the

Free Coinage of Silver.

For months a bill of this nature was under consid-ration, but the money kings were too powerful for the American people. A compromise has been adopted, providing for the monthly purchase of 4,500,000 ounces of silver, to be paid for in legal-tender notes, redeemable in coin of the United States.

While not altogether satisfactory, this measure has settled the question for the present, and much increase of circulation is likely to result therefrom; consequently easier times are anticipated.

What the farmer chiefly needs is the privilege of retaining a fair proportion of the profits of his products. Being robbed of this, he can have but little available funds, no matter how much money there may be in circulation.

Many industries and branches of trade appear to be fairly supplied with money. The banks are full to overflowing, and secure large returns on their investments. The farmer appears to be in the lurch and most distressed of any class only because somebody else captures the profits of his products.

He is as much embarrassed in his buying as in his selling. Being short of cash, he goes in debt for necessary supplies at ruinous credit rates, anticipating better times—which never come.

The injunction is, "Pay as you go;" you have this gratuitous advice from almost every writer and speaker, as a solution of our financial troubles. But how can the farmer pay as he goes when his goings are continually greater than his comings, in spite of his most desperate efforts "to make both ends meet"? Does he not work a sufficient number of hours? Ask the early twilight, the sun at meridian hight, or the dews of night! The country is certainly attractive and enchanting, but 16 hours of toil per day would mar and curse the glories of Paradise!

What other people labor so incessantly? Would you have him stint his table below its present level, in order that he might be able to pay as he goes? The inmates of San Quentin live as well, while charity and hospital patients are better clothed and fed! What other sacrifices would you have the average farmer make? Not one-half, not one-third of them feel that they can afford to subscribe for a farmers' paper! Printed in San Francisco is one of the best rural and Grange journals published in the United States; yet not one-half of the male members of our Order in this State are on the subscription list of the RURAL PRESS! Nothing can indicate a greater scarcity of money or a greater lack of interest in matters vital to farmers than this fact! The tether is certainly tightening. The slack in the rope has nearly run out, and we might as well brace our feet to withstand the shock that is surely coming.

Trusts and "combines" control the price of almost every product; hence the farmer is unable either to buy or sell at legitimate rates. He is the dupe and dumb, patient pack-animal of every other calling, simply because of his passivity or unorganized efforts. It is difficult to establish unity of action among farmers, chiefly because of their isolation and inaccessibility.

Then, again, if the Grange has an advocate, some other farmer will say he thinks the Alliance is better. If the Alliance has an advocate, the Granger feels antagonized, and between the two, sandwiched in with the constitutional grumbler, but little effective work is done.

The struggle for human existence grows continually greater. The organization of other classes for self-protection goes steadily on. The merchants, mechanics, cooks and hod-carriers are units of their kind. At their meetings they discuss, quarrel and even fight over resolutions and propositions presented, but when any measure is fairly adopted by the majority, the minority gracefully surrenders and joins the majority to push the work agreed upon. Hence the influence of these organizations, socially, politically and financially.

How is it with the farmers? Disintegrated, nowhere fully organized, apparently unconscious of their power and influence. Meetings are held, resolutions are discussed and adopted. The dissenters go home, grumbling and sad, while the majority, reaching their domiciles elated, go to bed and dream of victory, as did the people of Foxopolis, after having passed resolutions denouncing the frogs in the millpond for disturbing the midnight slumbers of the inhabitants by their continual croaking.

Every jewel has its price, and the measure of its value is the cost of its production. So with every human effort. The value of the attainment is measured by the sacrifices made. Effort is stirred by the divinity within us, and without it there can be no divinity of purpose. Sacrifices must be made by the lovers of humanity. The progress of the world is carried on the shoulders of a very few. Then will you not make a vow here to aid in the good work?

For the sake of our calling,

Join Something.

If you don't like the Grange, unite with the Alliance. If you like neither the one nor the other, why then, join the croakers. Increase their numbers to the greatest extent and when the society of croakers gets stronger than the Grange and the Alliance combined, then we will turn over and join them, to the end that all farmers may get aboard of the same craft for a single pull at least.

There was never a more propitious time than the present to move in the matter. "The fields are white unto the harvest." Driveling away is our substance by exorbitant expenditures in every department of the public service.

A general election is near at hand. The smooth-tongued politician is abroad in the land. He is affable and pliable now. Pledge him to do the service of the State, rather than that of the bosses and bribe-givers. Do you want another Legislature like the last? Twelve and a half million dollars appropriated for defraying the State Government's expenses of two years—$3,000,000 more than ever expended before in the same time. Over 72 cents State taxes last year, and it will take about 75 cents on each $100 of valuation to pay the State's expenses for the current year. Add to this the amount of your county and town taxes and figure out how much more you can stand.

Dear indeed are our party affinities. How we do love to whoop up for it. Its influence is certainly boundless, when it can seduce an honest man into voting for a thief simply because he happens to be on our party ticket. There is nothing but misery in the lead of such nonsense. We have got to get over all this unpatriotic twaddle before we can hope for better things.

But, says the wire-worker, the next Legislature will elect a United States Senator. What of that? What difference does it make to the average citizen which party secures its man? Every Senator elected from this State for the last 20 years has paid for the place in gold coin, either directly or indirectly. As to the merits of the men elected, the Lord only knows which has been worst. King Coin and corporations have controlled their action, and unknown and unnumbered are they as representatives of the dear people. The constable of your town is of more concern to you. Then cast party shackles to the wind and vote for *men* and *measures* calculated to secure equitable legislation and reduce the expenses of government.

Legislative Candidates.

The character of the Solons now seeking your suffrage is of deep concern to every voter. Important measures will be pressed upon the attention of the incoming Legislature, and we should commit no mistake in the make-up of that body. At best it will be all we can do to offset the bums and bribe-takers likely to be sent up from San Francisco. We must secure:

(1) The passage of an Act providing for the Australian system of voting in this State.

(2) An Act providing for the payment of State and county taxes in semi-annual installments.

(3) An Act providing for the re-assessment of Central and Southern Pacific R. R. property, whereby these corporations may be compelled to pay their delinquent taxes, amounting to over $3,000,000.

(4) An Act providing for the levying and collecting of an income tax on the net annual earnings of all corporations in excess of $20,000, graded so as to increase the rate of tax as the incomes of such associations increase.

(5) The election of a United States Senator who will pledge his vote and influence to changing the Federal Constitution so as to provide for the election of such Sena:ors by a direct vote of the people.

These are non-partisan questions in which every good citizen is deeply concerned. These are some of the live issues that should be brought prominently forward in the approaching canvass, and the partisan nominee who will not pledge himself to their support should be left at home.

If retrenchment in expenses and reforms in other directions do not speedily appear, our republican institutions will certainly be endangered.

There is unrest everywhere. A life and death struggle has commenced between the tax-payers and the tax-eaters. In every considerable city and town in the land this latter element is continually increasing. All eyes, the nation over, are turned to the country, whence only aid can come in this emergency. Disintegrated and their energies paralyzed by unju t burdens, the farmers are at present poorly able to respond to this call. Consequently disorders must arise. They have already arisen in many of the great cities. Their police forces are being continually increased in order to protect the lives and property of the respectable element.

If the yeomen of the nation were united in action and fairly prosperous, the danger would disappear. But they have been oppressed and plundered so often by unjust laws, corrupt court decisions, trusts and transportation companies that many of them have lost heart.

The way things are now running, thirty years hence will see the American farmer reduced to the condition of the French peasants of a hundred years ago. When appealed to by Louis XVI to aid him in quelling the Reign of Terror inaugurated by the red-handed Jacobins of Paris, they replied: "You have, by oppressions and extortionate taxes, robbed us of our substance, and all love for your government is gone. We therefore have nothing to lose and everything to gain in the success of the revolution."

May this nation be saved from a like calamity! Nevertheless, the tendencies of the times are certainly in that direction. The rich are continually growing richer, more reserved and exacting, while the poor are continually growing poorer and more dependent, with the soil-tillers working for a bare sustenance.

The moral tone of the affluent "society" people of the present day has reached a lower level than that prevailing in the voluptuous age, just before the fall of the ancient Grecian and Roman republics.

How can we check this evil tendency? Who will suggest a remedy? To my mind there appears but one practical solution of these difficulties—but one avenue of escape from the dangers of revolution—and that is, by unity of action among all farmers, to secure just and equitable legislation and a fearless enforcement of the laws; to restrain the rich and protect the poor; to place *manhood* above money and above obligations to party creeds, to the end that misdeeds may be punished, the administration of the government less expensive, simplified and purified, and every man made to feel that exact justice will be meted out to him.

You may call me an alarmist—it may be so. I judge the future by the past. I believe that like conditions produce like results the world over, and that if we would avoid the embarrassments and dangers of the past we must avoid the causes which produced them.

Take these thoughts home with you. Give them a candid consideration and I think you will at least agree with me in urging farmers to organize.

Grimes Up and Doing.

EDITORS PRESS:—**Grimes Grange held a lively and interesting meeting on the 23d inst. The busy season here is on, and the Patrons turned out in force.**

Sisters Clare, Schillig and Kilgore were appointed a committee on a Harvest Feast, and the members are looking forward to something grand. An invitation was extended Bro. Frisbie to visit us at his convenience, and we intend to give him a warm welcome when he does come.

Quite a number of our members purpose attending the Harvest Feast to be given by the Yuba City Grange on the 29th inst. We will expect our Yuba City brothers and sisters to return the compliment when we give our Feast.

Our Grange will be well represented at the Watsonville meeting. Besides our Worthy Master and his family, several of our members will be present. Brother and Sister A. A. Thayer were elected alternate delegates to the State Grange.

Bros. C. P. Wilson and Jesse Poundstone were elected delegates to the California State World's Fair Convention to be held at San Francisco September 11th.

A special meeting was called for Wednesday evening, August 27th, to confer the fourth degree on a brother who desired to attend the Yuba City Grange on the 29th.

This Grange is certainly in a very flourishing condition and promises to become even more so. We purpose to do everything in our power to make it interesting for those already members, and to attract others to seek admission. P.

Grimes, Colusa Co., Aug. 24, 1890.

He Will Be Right Welcome!

The many Californian members of our Order who had the pleasure of hearing and meeting Bro. J. H. Hale of Connecticut when the National Grange was with us last autumn, will read with interest the following letter, just received by the State Secretary:

SOUTH GLASTONBURY, CONN., Aug. 19, 1890.

Bro. Dewey: Possibly you know I have in charge a special investigation of the semi-tropic fruits of the country for the Eleventh Census of the United States. It is my intention now to visit your State early in the fall, and I hope to reach there in time to attend your State Grange meeting at Watsonville on the 8th of October; for I assure you nothing wou'd give me more pleasure than to meet once more with the loyal Patrons of the Pacific Coast; and at the same time there ought to be many in attendance at your convention who could give me much valuable information upon the subject I am investigating. Fraternally yours, J. H. HALE.

We will gladly welcome back so jolly a representative of the National Grange. His bright presence will help insure a lively session; and if Sister Hale (as we hope) is coming with him, it will be all the better!

NORTH PACIFIC INDUSTRIAL EXPOSITION.—**In inclosing to the editor of the RURAL PRESS a complimentary ticket for the second annual exposition of the N. P. I. Association, Sup't and Sec'y Allen says that the time has arrived when the character of the exposition can be largely determined, and he is pleased to be able to state that it bids fair to excel any ever held on this coast in the magnitude and beauty of its exhibits. Many new and attractive features, not hitherto found at any similar exposition in the United States, will be shown, and the Secretary believes that the educational value of a visit to the exposition upon this occasion cannot be too highly measured, and no one can afford to let the opportunity pass without carefully examining its wonders and enjoying its delights. We sincerely hope the display will fulfill its promise to the full content of its sanguine promoters.**

A Country Courtship.

Driving the cows from the upper meadow—
  Beauty and Brindle and Bess—
Now in the sunlight, now in the shadow,
  And now in the wind's caress,
With song as sweet as at morn the starling
  Is wont to the skies to trill,
Mollie, the farmer's daughter and darling,
  Comes tripping adown the hill.

Purple and black are the braided tresses
  Her dainty temples that crown;
Light is her step on the sward it presses
  As fall of the thistle-down.
The squirrels peek from the wayside hedges
  As the maiden moves along,
And count it chief of their privileges
  To list to her jocund song.

Down where the alders and slender rushes
  Border the rivulet's banks,
And the widened sweep of the water gushes
  Under a bridge's broad planks,
Whistling a love-song in broken snatches—
  His hat pushed back from his brows—
Robin, the miller, awaits and watches
  For the coming of the cows.

Up to their knees in the stream, the cattle
  Drink deep of its crystal flow;
Little they care for the lovers' prattle
  Or the bliss the twain may know.
Their heaving sides with their draughts distended,
  They enter the path again,
And crop the grasses, with heads low bended,
  On either side of the lane.

The shadows deepen, the dew is sprinkling
  With diamonds all the meads;
And faint and far, in the distance tinkling,
  The sound of the bells recedes.
Still on the bridge where the water glistens,
  As the moonlight on it falls,
The miller talks, and the maiden listens,
  But the cows are in their stalls.

—*H. D. Kelly in Ladies' Home Journal.*

Subjects for Conversation.

[Written for the RURAL PRESS by MARGARET B. HARVEY.]

When I was a small girl, about thirteen years of age, I was consumed with an unquenchable desire to be "ladylike." And to be ladylike I thought implied the ability to converse well. I confided some of my ambitions to my Sunday-school teacher, whom I believed a miracle of perfection.

"Yes," she said benevolently, "it *is* a good thing to be able to converse well—it *is* 'ladylike.' As you grow older and gain more knowledge of the world, you'll learn how to converse. For instance, if you'd been a little older and seen a little more, you wouldn't have talked about what you did the other day."

"What I did the other day!" I exclaimed in surprise and fear. "What was it?"

"About the horses—that wasn't interesting!"

Not interesting! I felt utterly crushed. That, for the time being, was the end of my ambition. I had committed the unpardonable blunder of relating something that was not interesting!

But many times since has this conversation come back to me. Many times have I remembered the circumstances under which I told "about the horses."

My teacher, another lady, the latter's nephew and myself were in a Germantown wagon, driving along a romantic country road. The horse stopped to nibble at some bushes that overhung the post-and-rail fence. I noticed it and exclaimed:

"A horse will eat lots of things—he'll chew a pine log!"

"How do you know?" asked my teacher.

"Because we had a hired man that told me so. He had been in the war and seen the army horses do it." Then, struck with a sudden recollection, I added: "That man told us a great many queer stories. He said that some of our own soldiers stole horses from the Government and sold them to the rebels."

"Why, Emma!" "Why, Tom!" "Did you ever hear of such a thing?" "Wasn't it dreadful?" It was with such exclamations of surprise and incredulity that my statement was received. Yet, two days later, Miss Emma herself told me that it was "not interesting."

In the light of recent experience, I venture to assert that it *was* interesting. It interested me when I heard it first; it interested my hearers when I repeated it. I have never repeated it since, but I have often wondered whether it was really true. Never yet have I seen anything of the kind mentioned in the many-times-told "annals of the war"—never yet have I met another soldier who related a similar story. Yet so strong was the impression of that "squelching" that I have scarcely recovered from it yet. I have never had the courage to ask a single question about army horses for fear I should lay myself open to the reproach of being "uninteresting;" and I have no doubt that I shall go through life ignorant concerning some of the very things I want to know, simply because I cannot bring myself to ask.

My teacher's words have not come true. As I grow older and gain more knowledge of the world, I am more and more in doubt as to what constitutes the fine art of conversation. If, as the critic of to-day is so ready to declare, this is a lost art, it may be because the people of to-day were squelched when they were little, as I was. If they had been left to their own unperverted instincts and permitted to talk "about horses," perhaps they would be talking much better now. Perhaps some out of them all would have volunteered to tell me about army horses, and not felt afraid. I might have known by this time what I have long wanted to know, without asking a question.

But oh! I *do* hear so much that does not interest me a particle. Is the fault with people or with me? The same Miss Emma consumed a whole hour telling me how her dog bit her chicken—I did not know that she had a chicken, and was mortally afraid of her dog. Would she have been offended if I had told her that *that* was "not interesting," or would she have said, as many do, "If it interests me, it *ought* to interest you"? Well, perhaps it ought, yet whenever I hear that stale exhortation, "Be a good listener," I feel like exclaiming, "That means a brave martyr!" I have known of brave martyrs afterward hearing of themselves something like this: "I tried hard to entertain her, but I couldn't. She sat there two mortal hours and never said anything but 'Yes' and 'No.' I never was so tired in my life! Did you ever hear of anything so trying?" This is, truly, "the pang without the palm" with a vengeance. The martyr could have said more than "Yes" and "No" if she had only known that she was expected to say more. Had the other not tried so hard to entertain, she might have found herself in the way of obtaining the very piece of information that she wants, for we all have "horses" that we are afraid to mention.

Now what is to be done about it? What are our young people to do—and older ones, too—if they sincerely desire to improve? I'm sure I don't know, but I feel like advising them thus: "Don't be afraid of horses, if horses happen to be on your mind." Yet I have horse-sense enough to perceive that this rule, literally followed, would often lead to trouble.

The old books on etiquette contained a rule of this order: "A gentleman should never use Greek words in the presence of ladies, as ladies cannot understand them." I heard of a young man who attempted to follow this rule; he was in doubt concerning the rendering of a certain passage in Homer. In the hope of having his difficulties cleared away, he went to the residence of the professor, to meet there, *not* as he expected, the professor alone, but the professor and his charming niece. Our young man was profuse in his apologies. "You must excuse me for bringing Greek roots into your parlor, etc.," but the professor cut off the pretty speech by remarking quietly to his niece, "Mary, your version of that passage was better than that of any of the students. I used it in my lecture to-day." I wonder how much you could have sold the young man for. Very likely he thought it wouldn't always do to "adapt your knowledge to the capacity of your hearers."

And the old books said: "Avoid religion and politics as subjects for conversation." This cannot be done. It is surprising the rapidity or the certainty with which any conversation, continued past a certain point, drifts into religious topics. This may be set down as a law that never fails, showing that the subject of religion, even in the minds of careless men, is more real than people think or will admit. And no one not a wooden image can live through an exciting political campaign and not catch the infection that is in the air and express himself accordingly.

It ought to be supposed that anybody knows enough not to talk about difficulties with servants, to enlarge upon the shortcomings of other people, to complain of their food, to dilate upon dress, to obtrude their business. But how often are you likely to hear anything else? Strange to say, you are constantly regaled with just such "stuff"—for it *is* stuff—from people of whom you have every reason to expect better things. But if it interests them perhaps it's all right—evidently they don't want to hear about books, music, scenery or travel.

I once knew a woman who had crossed the Atlantic six times. All I ever heard her tell about any of her voyages was in this fashion: "The Americans know nothing but trade. You'll find that out if ever you go to Europe. The men on the steamer always ask, 'Who's that, what's his line?'" I was ignorant enough to confess that I did not understand the meaning of the question, "What's his line?" "Oh," answered my informant, "it means 'What does he buy?'" Then I understood—far more than my informant thought. I understood that all the American men whom *she* knew were buyers like her husband. I had lived with Americans all my life and knew many who had been to Europe, but had always innocently supposed that they knew something besides trade, as they said so little about it. I knew numbers of American men who had gone to Europe for the sake of art, science or education.

Before I forget, I must be audacious enough to lay down one cast-iron rule. No matter whether I am good authority or not—heed it. Never talk about the "bawths" or "bahths" you have taken (the spelling is *bath*), nor say that you have been "cleaning yourself." This is a recent exorescence of Anglo-mania as disgusting as it is surprising. People of sense take it for granted that you are clean—they know all about the ordinary means of becoming so. You don't need to advertise the fact that you are not dirty. An Englishman does it for fear somebody will think him a common person who does not bathe. You are under no such disagreeable necessity in a country where we are all aristocratic and all common.

Similarly, let me beg you to spare sensitive stomachs. It is a difficult matter to write about—but there are certain topics which some persons can never hear mentioned without suffering all the pangs of seasickness. I might illustrate, but I could only do so at the risk of hurting somebody else. The strange part of it is that what influences one may not another; so it is safe to keep quiet. Hearing is worse than seeing. I could go into a hospital and behold the most terrible sights with scarcely a tremor, provided I thought I could be of some use; but let another person come and tell me about them, and I feel just ready to faint or die.

After the above, you naturally expect me to indorse the old rule: "Spare us your ailments." So I do; but within certain limitations. The person who has recovered from a spell of sickness is like a shipwrecked mariner providentially brought to land—he needs some interest and sympathy if he is to get along at all. It may do you quite as much good as it will the convalescent if you show that interest and sympathy. As for the half-sick, those who are always complaining without apparent cause, they are more to be pitied than the out-and-out ill. I can understand the feeling of the small boy who exclaimed: "Mamma, if I've got to be sick at all, I'd like to be sick decent!"

And how about the other old rule: "Don't talk about yourself; it sounds egotistical!" Why, it is safe to break this sometimes. People want to hear about yourself; if they don't, why are they so anxious to pry into your private affairs? If you don't say something about yourself, you will soon discover that you are the object of unpleasant suspicions; you will hear such remarks as: "Miss Grace must have some mystery about her," or "Miss Grace is very selfish; she keeps everything secret." When you are talking about yourself, you are not talking about your neighbors. Furthermore, what you do choose to utter, you must utter on your own responsibility—not that of other people's "what *I* think," not "what Mrs. Jones thinks."

When all is said and done, better say something than nothing—better chatter like a parrot than keep still like a wooden tobacco sign. There is music in the human voice, even when its tones are imperfect and when not a word can be distinguished. Our voices were given us to use, even with the risk of using them improperly. Suppose you *do* blunder occasionally; we are all in the same boat, for everybody else does. Unless your blunder is very glaring or oft-repeated, nice people will never notice it nor dwell upon it, and you needn't mind people who are not nice. Be nice yourself toward other people. Exercise judgment and charity. If you try to aim high, you cannot fail to get hold of proper subjects for conversation sometimes, and when you do, it will tell in your favor and be remembered longer than your less felicitous occasions. We will still try to believe that conversation is not yet a lost art; it should not be, when to converse is something that we all have to do, if we have our faculties at all. Try to converse—try!

Save Your Steps.

Written for the RURAL PRESS by MAUDE S. FRASER.]

"Although I expect a great deal of my little ones," said my neighbor to me one day, "I by no means use all my spare energy in training them. I really have found it much harder to control myself than to hold my children in check."

"Surely," I said with a smile, "surely you do not easily lose self-control. I have often admired your sunny, even temper."

"I am not naturally so," she said with great humility. "I must watch myself continually if I would be the example I wish to keep before my children. Then in order to save my strength to use in their best interests, I must save my steps."

"I think you are right," I said slowly. "A step is a small thing of itself, but very important in the aggregate. How many steps do you suppose you take during the day?"

"They could not be easily estimated," said my friend, "and yet, as you know, I have taught my children to give me a great deal of assistance. I do not have to move about on tired feet in the evening picking up toys and clothing they have left scattered about. Then as I am not strong, I have to sacrifice my pride for my health and the happiness of those about me. I have to *make* my work light about the house. We very often eat in the kitchen, especially in the cool weather, because there it is only one step instead of a dozen from the stove to the table."

"I think you are very wise," I said encouragingly. "This pretty little dining-room makes a nice room for you and the children to sit in, and you save all the steps you would otherwise take with those tired feet from this most convenient china closet to the table. I wish all mothers with limited strength were as wise as you."

"My dear wise mother gave me many of these strength-saving thoughts. It is really the steps—the unnecessary steps, one takes during the day that are fatiguing rather than the work itself. I try not to go down cellar for one thing, and leave on the table several articles that I will by-and-by need to make an extra trip to put in place. I have learned to work both ways; carry something down and bring something back. I observe the same rule in going up and down the stairs to the rooms above."

"Perhaps I am tiring you," she said with a little start.

When I eagerly assured her of my interest, she invited me out into her neat little kitchen.

"See," she said, "I try to keep my working utensils where they may be easily found. Think how many steps I save on wash-day by having everything I need from the boiler to the bluing-rag as near the wash-bench as is consistent with neatness. On baking day my patent cabinet table is a treasure in itself, for I am able to keep in it all the materials I would need to use besides the necessary pans for baking."

"In my model kitchen I shall have the motto: 'Save your steps,' I said, as I thanked her with a smile."

He Didn't Want to Trade.

Dick Sharp owns a pretty fine rig. Yesterday evening Dick drove into the country to get a breath of fresh air. When about two miles out, he overtook a sunburned stripling who was driving the toughest-looking specimen of horse-flesh that Dick ever saw. His tongue hung out like a stocking on a clothes-line, his legs were covered with spavins and warped like a rustic chair, his eyes were entirely gone and sickening, mattery boles were in their places, while his tail was worn down to a mere stump by incessant switching. Along his sides and back, where the harness rubbed, were large sore spots, and what was left of his mane was matted together with burdocks and chaff. Dick was a good deal amused at the sickly skeleton and kept looking at him longer than he should have, as the sequence will show. Just as he drew up the lines to drive past, the boy stopped his horse and said: "You seem to be taken with this horse of mine, mister; if you want to take a good look at him, it won't cost you anything; I'll just size up that off horse of yourn and mebby we can make a swap."

This proposal, made in the best faith, apparently, by the boy, staggered Dick, but he got out and looked at the horse's teeth, and tried to shove his tongue back into his mouth, without success, however.

"What makes him keep his tongue hanging out that way?"

"It's his lungs, mister; that animal is so full of good, sound robust lungs that something has got to protrude."

"What went with his eyes?'

"Oh, we had them taken out; too much life; had to do it; did it to curtail his spirits. Why, mister, before we deprived that animal of his sight it was awful to see him go; no rig could stand it. The moment he saw a team ahead of him he began to race, and no power on earth could stop him."

"I notice he's got a few knobs on his legs."

"Yes—I was just going to call your attention to them; we put them there—did it to tone him down. About once a week he gets too high strung for us, and we have to beat him over the legs with a hammer till a spavin comes out; that sobers him somewhat. It seems cruel, but we've got to do it to sadden him a little or no one could ride behind him."

"What did you shave his tail for?"

"Didn't shave his tail; fast trotting did that. I know you'll think I'm stretching it a little, but before we took to putting these spirit-sinkers on him and he got under full headway, his hair blew away like chaff in a windstorm. Do you see them sore spots on him? He used to be all over like that; effects of speeding him; rushing through the air. Now, you see, just before the fall races begin, I'll quit depressing his spirits and go to the county fair and win a bag of money. I tell you it requires intellect to understand this horse's nature. How'll you trade?"

Dick didn't care about trading and drove off, while the boy chuckled: "I guess the next time he sees a plug he'll not count the spavins on his legs."—*Toledo Blade.*

Chaff.

"YOUR account has been standing a long time, Mr. Dukey." "Then give it a seat, my dear Sheare." "Very glad to, sir. Shall we make it a re-ceipt?"—*Harper's Bazar.*

TEACHER: Johnnie, what is a conversation between two persons? Johnnie: A dialogue. Teacher: And between more than two persons? Johnnie: A polly'wog.—*Munsey's Weekly.*

SHE (reading the paper): Another cyclone out West! It has swept dozens of farms clear of everything. He: I'll bet the mortgages didn't budge an inch.—*Siftings.*

SOMETIMES a typographical error adds zest, as in one "local" which began, "Dr. Smith, who is widely known as one of the most killful of our physicians," the "s" having disappeared with the usual depravity of inanimate things—or shall we say, with a divination of the truth wholly unusual?—*Christian Union.*

Betsy Hicks' Story.

"How nice it would be if a woman had some way of earning a few dollars for herself," thought Betsy Hicks as she twisted her hair into a tight knot on the top of her head. "Now, some farmers' wives have the butter-money, but our butter-money all goes to help pay the interest on our indebtedness, and as I do no milking and only a small part of the butter-making, the money would not be really mine. Eben cannot get time or money to fix up my chicken-house, and so I can make nothing on my poultry. If I could only write for the papers as my teacher did! She said I had talent, and I know I could write a better story than some of the silly trash I have read. I believe I could make a nice story of something that happened in our village when I was a young girl." While Betsy meditated, she finished her toilet, made the beds and dusted, and dressed the baby, and embellished the facts of her story in a manner that only a lady of keen imagination could have done. It had long been Betsy's habit to snatch the few moments while rocking baby to sleep, for reading, and this morning she chanced to pick up an article which told of Louisa Alcott's first attempts, and how she only got five dollars for her first story. To Mrs. Betsy Hicks five dollars seemed quite a sum, and she stopped her reading to calculate how many stories it would take to re-roof her chicken-house, for way down in Betsy's heart she was caring more for her poultry than the fame of a writer of romance.

Mrs. Betsy was a practical little woman devoted to kitchen, babies, dairy and poultry, but she was driven to an extremity in her need, for there was a mortgage on the farm, and her good man worked early and late, and undertook more than he could execute, in order to keep up the interest. Perhaps he had gone more deeply in debt for machinery than he ought. As Betsy meditated on this manner of raising money, she drew her chair nearer the glass and compared her freckled brow with that of Elizabeth Stuart Phelps. The comparison must have been pleasing, for she laid the now sleeping babe in the cradle and brought out her long-unused writing desk and began her story. Her fingers were stiff from hoeing, the previous evening, but the story was progressing finely, when Maggie, the hired girl, put her head in the door to ask if "Missus was ready to make the pudding she promised Master for dinner."

"O Maggie," hesitated Betsy, "I am not feeling well, so I will let it go until to-morrow, and you can open a can of fruit for dessert." "Eben won't like it so well," she reflected, "but a woman cannot always be in the kitchen. The mind needs nourishment as well as the body." Never had Betsy's mind felt the need of nourishment so much as on this important morning.

I need not tell you how the baby cried, how Maggie needed new instructions for dinner. The story was only begun that morning, but after a week of such interruptions, Betsy's story was ready for the press. The big cyclopedia had given her instructions about writing only on one side of the paper, etc. One of the greatest drawbacks to her writing had been the frequent appearances of Eben at the door, with inquiries as to where she put the hoe and other distracting questions. At each of these untimely calls, Betsy had secreted her writing beneath a pillow and hastily set a few stitches in a patch on Eben's overalls.

Eben had told her, on the occasion of his sixth call, that he thought those overalls scarcely worth the labor she was expending on them. This was embarrassing, but now she had the story finished, and it really read very well. Betsy deliberated as to what paper she should send it, and decided in favor of the agricultural paper Eben subscribed for; in fact, her only chance of seeing it in print lay between that and the county paper, and the stories in the county paper were all printed on the patent side.

"I shall not dare have it returned in case it isn't published," thought Betsy, "for Eben would be sure to get it from the office. I will tell them to put it in the waste-basket if it is not worth publishing. I do wonder how long it will be before they send me a check, if it should be published."

Betsy opened the papers very eagerly for the next three weeks, when one day Eben returned from town, and throwing an envelope in her lap grunted out: "Thought you'd be very sly, didn't you? You'd better mend the pockets in my coat before you turn blue-stocking."

When Eben made his exit, Betsy tremblingly opened the letter, to find there would be no check, but the beloved story was to be published. "We shall not throw the manuscript in the waste-basket," wrote the editor, "but we cannot pay for such matter. We always publish anything short that points a good moral."

"Well," sighed Betsy, "it pointed a good moral. I am glad of that, but I shall have to find some other way to get a new roof on the chicken-house."—*Prairie Farmer.*

A LIVING PROOF.—Young Mr. Freshly, conversing with an elderly friend of the family: When I see how we have things now, electricity, telegraph, telephone, and think how people lived sixty years ago, I can't help thinking that our grandfathers must have been fools. Mr. Oldboy (obviously nettled): When I see some of their grandchildren, I can't help thinking the same.—*Boston Times.*

YOUNG FOLKS' COLUMN.

Story of a Little Yellow Frog, as Told by Himself.

[Written for the RURAL PRESS by F. W. E. W., aged 11.]

The first that I remember, I found myself in a dark hole, in the corner of a great, damp world.

My mother was relating an incident which had occurred just before I had awakened. She said that upon awakening from a sound slumber, she had heard a great rumbling noise, and upon looking up she saw a great something come floating down an inclined plane.

"This," she said, "I immediately concluded was a human." She had something in her hands that were large and slick and round, and had a large open place in the top. One could easily see through them, for they were made of a substance called glass. She set them on the ground and one of them fell over.

"Now I want to tell you, little froggies," she continued, "that I do not want you to go near them, for although they are pretty, there may be harm in them."

So my mother concluded, and after telling us that we might hop about and enjoy ourselves as best we could, she settled herself for a quiet nap.

We began to hop around and to search for something to enjoy ourselves with. We very soon became tired of this sport and my older brother hopped into a corner and went to sleep. My younger brother and myself were very curious, so we began to hop again.

We hopped until we came up to those large glass things (I have heard since that they are called jars), and forgetting our gentle mother's command, we went into the one that had fallen over.

We were in there having a good time playing at skating rink, when suddenly another of those great tall somethings which are called humans came floating down that inclined plane, and a voice said: "Why, mamma, you've turned over one of the glass jars."

Then we felt ourselves suddenly thrown downward, and found that the big glass jars were almost all sides, and that the only place we had to hop in was a small, round, slick glass floor.

Oh, the terror we felt when we found that we could not get out! Our poor mother came and tried to help us, but she could do us no good. We tried to climb up the walls of our glass prison, but try as we might, we could not get out.

Our mother, after trying for some time to get us out, left us and went back to our hole with my other brothers and sisters.

Oh, it would be hard to describe the misery which we then went through. The hunger, cold and loneliness would be too hard to describe.

One morning I awoke from a night of pain to find my poor little brother dead. Then my misery was worse than ever. It is more than I can bear to tell it. With my brother it was hard enough, alone it was worse. But as my poor frog toes are worn out with writing, I will not try to tell it.

One morning I saw another one of these large somethings come down that inclined plane and I heard a sweet voice say: "Oh, you poor little thing!" On looking more closely at her, I noticed that she was smaller than the other humans and was what people call a little girl.

Suddenly I felt my glass prison lifted, and then I was borne up, up, up into the light above. It was so very light that I had to shut my eyes to keep from being dazzled. I was taken into a house and shown to some people and then I heard the voice say again, "I am going to take him back and let him out." My heart gave a great leap. Was I to be set free after all my sorrows?

Then I heard that sweet voice say again: "Oh, sister, here is the skeleton of a poor little froggie who has died in there. I must set this little fellow free or he will die too."

Then my little preserver carried me back again to that damp world which people call a cellar. I felt the jar turned up and I hopped away, feeling happier than I had ever felt before in my short frog life.

Elmira.

The Lost Ring.

"Please tell me a story, Auntie," said little Ethel, one stormy afternoon.

"If this weather continues, my stock of stories will soon be used up," said Ethel's pretty young aunt, but she laid her book aside just the same, and sat down by the little girl, and began: "When I was six years old my Uncle George brought me from Boston the prettiest present you can imagine. It was in a little white box. Can you guess what it was?"

"A muff," said Ethel, who had a new one.

"No; something very small."

"A little watch."

"Smaller than that."

But Ethel could not guess until Auntie said, "Something to wear on one's finger."

"Oh, I know, a ring."

"Yes, a lovely little ring, set with two rubies and a pearl," said Auntie. "I was so pleased and so careful of it that they let me wear it all the time, although it was an expensive ring and did not fit very tightly.

"I had two playmates whom I loved very dearly, a black and white kitten called Spot, and a half-grown chicken named Peter.

"When Peter was little his mother used to peck at him and drive him away from her, until at length I took pity on him and cared for him myself. He was very grateful, and would follow me everywhere. I asked sister Annie to find a good name for him, and she said 'Peeper' would be a perfect fit, but I thought 'Peter' sounded better, and chose that instead. He learned to know his name, and would come whenever I called him. I felt sure he and Spot understood everything I said, and I used to talk to them as other girls do to dollies. I did not like dollies. They couldn't run about with me like my pets.

"One day after I had been playing hide and seek among the haycocks with Spot and Peter all the morning, I came in to dinner and found, when I was washing my hands, that my dear little ring was gone. How I cried! The whole family helped me look for it, father and mother and all, but it was of no use. The ring was nowhere to be found.

"I felt so badly that I couldn't play at all that afternoon. Peter seemed to sympathize with me, I thought, but Spot was as frolicsome as ever. I sat down on the doorstep in the afternoon, almost heart-broken, and said, 'O Peter, *won't* you and Spot help me find my ring? You know I would do anything I could to please you.'

"Spot only climbed the wooden piazza posts in reply, but Peter looked carefully about, turning his head first one side and then the other, and began to scratch among some loose straws that were scattered about, and what do you think! There was the ring beneath them.

"I ran to mother with it, so happy I could hardly speak, and then I ran back to Peter and hugged and kissed him more than he liked, I am afraid. Afterward I made him a nice dish of Indian-meal dough, with plenty of corn sprinkled in it, like plums, as I could think of nothing he would like better, and he seemed very much pleased with it. I thought Spot seemed a little jealous, but I wasn't quite sure."

"Thank you, Auntie," said Ethel, and then she ran off to play at being auntie herself, and she acted the whole story very nicely, with the old cat for Spot and the baby's rubber chicken for Peter.—*Portland Transcript.*

DOMESTIC ECONOMY

RICE BREAD.—Two cups milk, two cups boiled rice, one cup white cornmeal, three eggs well beaten, two tablespoonfuls butter, teaspoonful salt. Bake in a hot oven, in rather shallow pans.

APPLE SNOW.—Bake six good apples, take out the pulp, and when cold beat it thoroughly with the whites of three eggs, and sugar enough to stiffen a little; serve with a boiled custard for sauce.

BAKED BANANAS.—Select large, ripe bananas, and bake them in the oven as you would potatoes. When the skin begins to split at the seams they are done. Take them out, and serve one to each person, as a vegetable. They should be peeled and eaten with butter and a little salt.

CREAM PIE.—Line a plate with crust, stir to a cream one-half cup of sugar and one tablespoonful of butter, add two well-beaten eggs, two tablespoonfuls of flour and two cups of milk; mix all together well; flavor to suit the taste, pour into the lined plate and bake like a custard pie.

TO MAKE RASPBERRY SALAD.—To a quart of ripe raspberries you need half a pint of red currant jelly and a gill of clear syrup, made by dissolving a gill of sugar in a saucepan with a tablespoonful of hot water; when melted, add the currant juice; when cold, pour this all over the raspberries and set on ice till morning.

TOMATO SALAD.—Cut six ripe tomatoes into slices and remove all the seeds; rub a dish with onion and pour into it a mixture of oil and vinegar (in the proportion of two spoonfuls of oil to one of vinegar), sprinkle on the tomatoes pepper and salt, and leave them in the dressing two hours. They will then be ready to serve.

LEMON PIE.—Two lemons, juice and grated rind, two cups of white sugar, one cup of cream or rich sweet milk, two tablespoonfuls of cornstarch mixed with the yolks of six eggs; bake in a rich crust. Beat the whites to a stiff froth with eight tablespoonfuls of pulverized sugar; spread on the top of the pies and brown; this will make two pies.

COCOANUT BALLS.—Measure two cups of freshly grated cocoanut. Beat the whites of two eggs to a stiff froth, add four tablespoonfuls of powdered sugar, mix carefully, and then stir this into the cocoanut. Form into tiny pyramids, using sufficient sugar to stick them together. Place them on greased paper and bake in a moderate oven until a golden brown.

GERMAN PUFFS.—One pint of milk, three eggs, a little salt, and flour enough to make a thin batter; pour into eight buttered cups. Have the oven hot, and don't be discouraged if they don't rise for the first 20 or 25 minutes; they will soon surprise you by puffing above the cups and turning a golden brown. For sauce, beat pulverized sugar and a small piece of butter together, moisten with milk and flavor.

GOOD HEALTH.

THE KEMMLER EXECUTION.—Much unfavorable comment has been made in the papers in regard to the Kemmler execution. These comments are no doubt largely due to the supposed degrading innovation which such executions may possibly engender in the minds of oversensitive persons. Such objection is senseless. The supposition on the part of some persons that the death of Kemmler was prolonged and highly painful is without reason. His taking off was without doubt instantaneous and absolutely painless. The physical distortions manifested were purely muscular, and may be produced in the same way upon any cadaver, as is well known to all medical men. If the current had been kept up for a few seconds longer, no such indications would have occurred, unless the current had been turned off and then turned on again, which would have been an unnecessary thing to do. The current should have been passed through the body by way of the two hands properly moistened and secured in the circuit. Everything about that execution, when properly considered, shows that it was certain, humane and in every way proper. It has proved that the traditional and barbarous gallows should be consigned to oblivion.

MISTAKES.—It is a mistake to labor when you are not in a fit condition to do so; to think that the more a person eats the healthier and stronger he will become; to go to bed at midnight and rise at daybreak, and imagine that every hour taken from sleep is an hour gained; to imagine that, if a little work or exercise is good, a violent or prolonged exercise is better; to conclude that the smallest room in the house is large enough to sleep in; to eat as if you had only a minute to finish the meal in, or to eat without an appetite, or to continue after it has been satisfied merely to please the taste; to believe that children can do as much work as grown people, and that the more hours they study the more they learn; to imagine that whatever remedy causes one to feel immediately better (as alcoholic stimulants) is good for the system, without regard to the after effects; to take off proper clothing out of season because you have become heated; to sleep exposed to a direct draught; to think any nostrum or patent medicine is a specific for all diseases.

WHAT IS TRUE LIFE?—The mere lapse of years is not life. To eat, and drink, and sleep—to be exposed to darkness and to light—to pace round in the mill of habit and turn thought into an implement of trade—this is not life. In all this but a poor fraction of the consciousness of humanity is awakened, and the sanctities still slumber which make it worth while to live. Knowledge, truth, love, beauty, goodness, faith, alone can give vitality to the mechanism of existence. The laugh of mirth that vibrates through the heart, the tears that freshen the dry wastes within, the music that brings childhood back, the prayer that calls the future near, the doubt which makes us meditate, the death which startles us with mystery, the hardship which forces us to struggle, the anxiety that ends in trust, all these are the true nourishment of our natural being.—*James Martineau.*

MARRIAGE WITH DRUNKARDS.—The efforts to raise the poor and degenerate inebriate and his family are practically of no value as long as marriage with inebriates is permitted. Recently the Legislature of the State of Victoria, in Australia, has passed a law which gives a wife the right of divorce if the husband is found to be an habitual drunkard. If after marriage she discovers that he is an inebriate, she can also get a divorce. The husband can do the same with a wife if she is proved to be an inebriate. This is a clear anticipation of the higher sentiment which demands relief from the barbarous law which would hold marriage with an inebriate as fixed and permanent.

FOR SLEEPLESSNESS.—It is claimed that the most potent and most perfect remedy for sleeplessness is to drink hot water. If one awakens in the night, as hopelessly wide awake as if galvanized or electrified with vital activity, an invariable remedy is a glass of perfectly hot—not warm—water. It can be heated over the gas, or over a spirit lamp, and sipped while almost at boiling heat, and one who tries it will find himself going off to sleep like an infant, and getting, too, the most restful and peaceful sleep imaginable.

PALPITATION OF THE HEART.—Dr. Nebo (in *Journal de la Sante*) says that an excessive palpitation of the heart can always be arrested by bending double, with the head downward and the hands pendent, so as to produce a temporary congestion of the upper part of the body. In almost all cases of nervous or anemic palpitation, the heart immediately resumes its natural function. If the respiratory movements be suspended during this action, the effect is only the more rapid.

HEART DISEASE FROM OVER EXERTION.—A warning against undue physical exertion by those not accustomed to it is contained in the remark of the chief surgeon of the National Soldiers' Home at Dayton, Ohio. This physician said that of the 5000 soldiers in the home "fully 80 per cent are suffering from heart disease in some form or another, due to the forced physical exertions of their campaign."

The Week.

Next week will be the last before the opening of the State Fair, which will occur in Sacramento on September 8th. Consequently the next issue of the RURAL will appear as our customary State Fair number, with many additional pages and a proportionate increase in value and interest of contents.

Among the thousands of visitors at the State Fair the RURAL meets many new faces and wins many new friends. It is also one of the great occasions of the year for advertisers, and is fully appreciated as such by those who have had experience. Those desiring space should make early application, for our engagements for this year's State Fair paper are larger than usual.

The coming season promises to be one of unusual activity in agricultural operations, and manufacturers and purveyors of farmers' implements and supplies should make a good opening of the campaign by prominent declarations during State Fair time.

The promise for the display at Sacramento is unusually fine. Beginning with the great Admission Day celebration in San Francisco, and continuing then to the great Fair in Sacramento, the rural resident can see enough of the world to give him new relish and freshness for country activities. It will be a good change of scene. Take it!

Sound Trade in Produce.

We have so often proclaimed against gambling in food products and the fictitious and injurious standard of values thus established that we fear our readers may tire of the subject. We feel, however, that there is hardly anything of greater importance than to make our trade in the great staples sound and honest and the published quotations represent actual transactions. It is timely to refer frequently to this subject because of the bill pending in Congress known as the "Butterworth Anti-option Bill," which is designed to do away with the wretched system of trade-gambling which prevails in all great produce centers and casts its baneful influence over the whole producing area. Some friend sends us a copy of the *Eagle*, published at Wichita, Kansas, which contains a letter urging the passage of this Butterworth bill. The issue involved seems to be simply a question whether a few gamblers can control for their own benefit the entire wealth, labor and interstate commerce of this country or whether supply and demand shall make values and enable the farmers and producers to intelligently raise such crops as the soil they own is suited for, and the producer and manufacturer such goods as are a prime necessity which they know will be wanted without danger of having the value of their labor and production destroyed by the vandalism of selling promises in place of actual property.

The writer to whose article we allude makes the following strong statement of what we conceive to be the facts in the case:

It is well known that the quotations (manipulated) sent out from New York, New Orleans, Chicago and other speculative exchanges fix the values of the productions in this country and are used effectually in the markets of the world. When prices are depressed first in this country by sales of 100 times as much product as is produced, the buyers are appalled at the magnitude of the crops and supplies in this country and withdraw from the market, enabling the sellers of these false promises to put down values without hardly at times making a sale, checking consumption and distribution all over the world, and encouraging gamblers in other countries to assist in this downward flow of values by selling their promises in the United States against the crops of grain and cotton raised in Europe, Asia and India. It is well known that the more fictitious sales that are made, the easier it will be to buy back their promises at a profit, thus destroying the production of the world without furnishing any substitute to make amends for the injury they have done to the labor of the world, and particularly to these United States, which is one of the largest agricultural countries on the face of the globe.

It is to make this deplorable state of affairs impossible that the advocates of the Butterworth bill are laboring. They claim that it is the duty of Congress to foster the agricultural and laboring interests of this country first, not to the injury of other legitimate interests, but in harmony, and that harmony can be firmly established by legislating in favor of all restriction and abolishing all false methods of trading, and stopping all impediment to the free development of supply and demand principles for actual property, not promises that represent nothing and would be utterly impossible to keep.

It seems that opposition has been made to the Butterworth bill on the ground that it would prevent an actual producer from selling his crop in advance. This is provided against by an amendment which the author of the bill has himself offered in these words:

In any prosecution for dealing in futures or a violation of the provisions of this Act, it shall be sufficient defense thereto if the defendant therein satisfactorily proves that at the time of entering into any contract subject to such prosecution such contract was made with the United States, or any State or country, county or municipality, or that at the time of making such contract he was a farmer and had an article so sold in actual course of production at the time of making such contract, or that at the time of making such contract he was a manufacturer or producer actually engaged in the production of the article so contracted to be delivered, and that such contract was made with the intention in good faith on his part to actually deliver the article in compliance with the contract, and that the defendant at the time of making such contract had the ability and a reasonable expectation of being able in the ordinary course of his business to produce and deliver the article contracted about in compliance with such contract, and at the time had ability and a reasonable expectation of being able in the ordinary course of his business to procure and deliver the article contracted about in compliance with such contract.

Of course it is not intended to interfere with any transaction which in good faith intends to deliver the product. It is a movement against transactions which have no such intention whatever. The very existence of such contracts and false promises to deliver is a national disgrace, and destroys all incentive to honest labor, and encourages a spirit of gambling that will demoralize and debauch the rising generation.

Our Fruit at the East.

California fruit is most delightful to look at, from almost any point of view, this year. Each week some new phase of the interesting situation develops and all are interesting and encouraging. First of all, it is pleasant to know that our Eastern customers are pleased both with the fruit and the prices they are paying for it. The *American Cultivator* of Boston, after speaking of the beneficent act of California in supplying a good amount of fruit this year to save the Eastern people from the scurviness of a fruitless diet, and assuring its readers that fruit at almost any price is cheaper than doctors' bills, uses these words:

At this time last year, and in previous years, New York City alone would be receiving from New York, New Jersey, Delaware, Maryland and adjoining States not less than 300,000 packages a day of summer fruit, mostly peaches and pears. Now there are hardly 1000 packages a day arriving from all these States combined. To fill this enormous gap there is only the California crop. California is a great fruit State, however, and she is sending her products rushing across the continent in special trains in a manner surprising even to her own "hustling people."

Prices on California fruit are not over 20 per cent higher than last year. That is quite reasonable, considering the monopoly of the market that State's fruit enjoys this year.

It is a maxim of enlightened trade that it is quite as important to please a customer as to get one. Upon doing this depends our future sales of fruit, and comments like that of our Bostonian contemporary are grateful.

The question of how California fruit will do at the East in coming years when the local supply is not cut off, is of course an open one, and some hold that prices will recede to the old narrow margin between profit and loss to our growers. We do not so believe, but are firmly of the opinion that J. W. Nelson, secretary of the San Jose Packing Co., is quite right when he says: "Our California fruits will have a wider introduction this year than ever before, and even if the Eastern crop is good next year, we will more than hold our own." These words were probably intended to refer to canned fruit, but the application is the same in the case of fresh fruits.

Speaking of canned fruits, there has come an advance which even the most sanguine never dreamed of. Mr. Nelson said:

From information we have received there is hardly any fruit anywhere in the United States, outside of California. Prices here early in the season were low and a great many factories sold freely, but they began to hold their fruit and now prices have gone up marvelously and they are simply overburdened with business. We will pack at least 125,000 cans this season, and I have no doubt the entire pack of the State will amount to over a million. The combined capacity of all the canneries will prove inadequate to meet the demand. The pack of 1890 will be consumed long before the pack of 1891 and business next year will be more promising than ever.

The hunger of the Atlantic States for canned fruit is seen in the reports from New York that buyers quietly picked up 6000 cases of California canned peaches in English markets and have already shipped a large proportion of them to New York and sold them at a good profit. The movement of this fruit twice across the Atlantic and the payment of profits to all handlers, show the state of the market as forcibly as could any number of words. If California does not get a good world-wide advertisement for her grand fruit product this year, she is never likely to have one.

THE woolen-mill at Ensenada, Lower California, is kept running day and night in filling orders in cassimeres.

Death of Rev. Dr. McKaig.

Rev. Walter Wilber McKaig, well known throughout this State as preacher, orator and writer, died last Sunday in Oakland, aged 63. He had been for years afflicted with diabetes, and his death was the close of a tedious, often painful illness, the last three months of which he was kindly cared for at the Fabiola hospital.

Dr. McKaig was a native of Ohio, the son of a Scotch farmer. He studied for the ministry and began preaching as a Methodist, but afterward joined the Presbyterians. He had charge of churches in Cincinnati and Chicago, and when David Swing was accused of heresy, Dr. McKaig warmly espoused his cause, and was afterward tried himself, on similar charges, but acquitted.

Coming to California about 1865, Dr. McKaig first ministered to a large and thriving Presbyterian Society at Marysville, but having become a convert to liberal views, he moved to San Jose, where he preached for some time to the Unitarian Society.

Afterward, having studied law, he was admitted to the bar and practiced awhile in Colusa, having ex-Attorney-General Hart for his partner. But he was heard to say that although he could earn more as a lawyer than as a preacher, he always regretted having left the ministry. And in truth he never gave up preaching altogether, but often filled the pulpits of the late Dr. Hamilton in Oakland and of Dr. Stebbins in San Francisco, besides delivering addresses to various Spiritualist associations.

In later years he edited the Stockton *Independent*, and was engaged successively in editorial work on the Oakland *Tribune*, *Enquirer* and *Evening Express*. He also tried law and journalism in Los Angeles. His latest work was done for the *Illustrated Pacific States* and the RURAL PRESS, and the many articles which he wrote for our columns, from 1883 to within a few months of his decease, were marked by a philosophic insight, a humane spirit, a wise breadth of treatment and a combined strength of thought and felicity of diction which made them at once pleasing and impressive. His editorials for holidays and anniversaries, and on questions of wide bearing and large public import, were especially happy and suggestive.

Dr. McKaig was a member of the Knights Templar and the Enterprise Lodge of A. O. U. W. He leaves two sons and a married daughter, the latter residing in Chicago.

The funeral services took place at Hamilton hall, in Oakland, Tuesday morning. Rev. C. W. Wendte of the Unitarian church and Rabbi M. S. Levy spoke of the departed, and the following stanzas were feelingly sung by their author, James G. Clark:

Let me rest on Thy bosom,
I'm lonely and weary,
The stars are all gone from my sight;
Let me rest on Thy bosom,
On Thine, and Thine only,
Till darkness gives place to the light.
My last joy is taken,
My last hope is shaken,
The wild waters over me roll;
My heart all forsaken
Now turns to Thee only,
The day star and dawn of my soul.
Let me rest, Lord,
Let me rest.

Let me rest on Thy bosom,
The world may bereave me—
Thy law is my light and my stay;
Let me rest on the bosom
That never will leave me,
Though lover and friend turn away.
In language unspoken,
In silence unbroken,
I bring all my sorrow and woes;
Thy love is a token
That will not deceive me,
Nor leave me alone with my foes.
Let me rest, Lord,
Let me rest.

Shropshire Sheep at the State Fair.

The Directors of the American Shropshire Registry Association have voted to offer the following special premiums at the California State Fair, in September:

For best flock of registered Shropshires (2 shearling ewes, 2 ram lambs, 2 ewe lambs), 1st, $20; 2d, $15.

For best flock of 5 lambs (3 ewes, 2 rams), to be the get of one ram, and bred by exhibitor, $15.

Sheep eligible to compete for the above premiums must be recorded and have a number in the Record, a certificate of which must be filed with each entry; and each sheep must bear an ear-tag, with number and initials corresponding with that given on the certificate.

A Nicaragua House.

The canal projectors contend that Nicaragua is the greatest existing field for American enterprise. However that may be, we shall all hail with delight the commencement of practical work on that great engineering scheme. Since the virtual collapse of the Panama canal this Central American offers the only location possible for a ship canal between the Atlantic and Pacific oceans. The reason is two-fold. Firstly, the interruption of the great mountain chain, extending practically from Valparaiso to the Mexican frontier; secondly, that Nicaragua lies outside of the zone of calms, which would have rendered the Panama canal useless for sailing ships. The people of Nicaragua have a type of house—such as is shown in the engraving on this page—much like that in which the Mexicans of California lived before the advent of the Americans. It is of adobe with tiled roof and an arched corridor or porch around it. Senator Stanford has adopted this general style for the buildings of the Leland Stanford University, thinking it best fitted for the climate. The buildings are of one story, with arched corridors, but stone takes the place of the Mexican adobe. Such structures are warm in winter and cool in summer. There are still numbers of such buildings standing in portions of California; a few of them being out toward the Mission in this city.

The Sequoia Reservation.

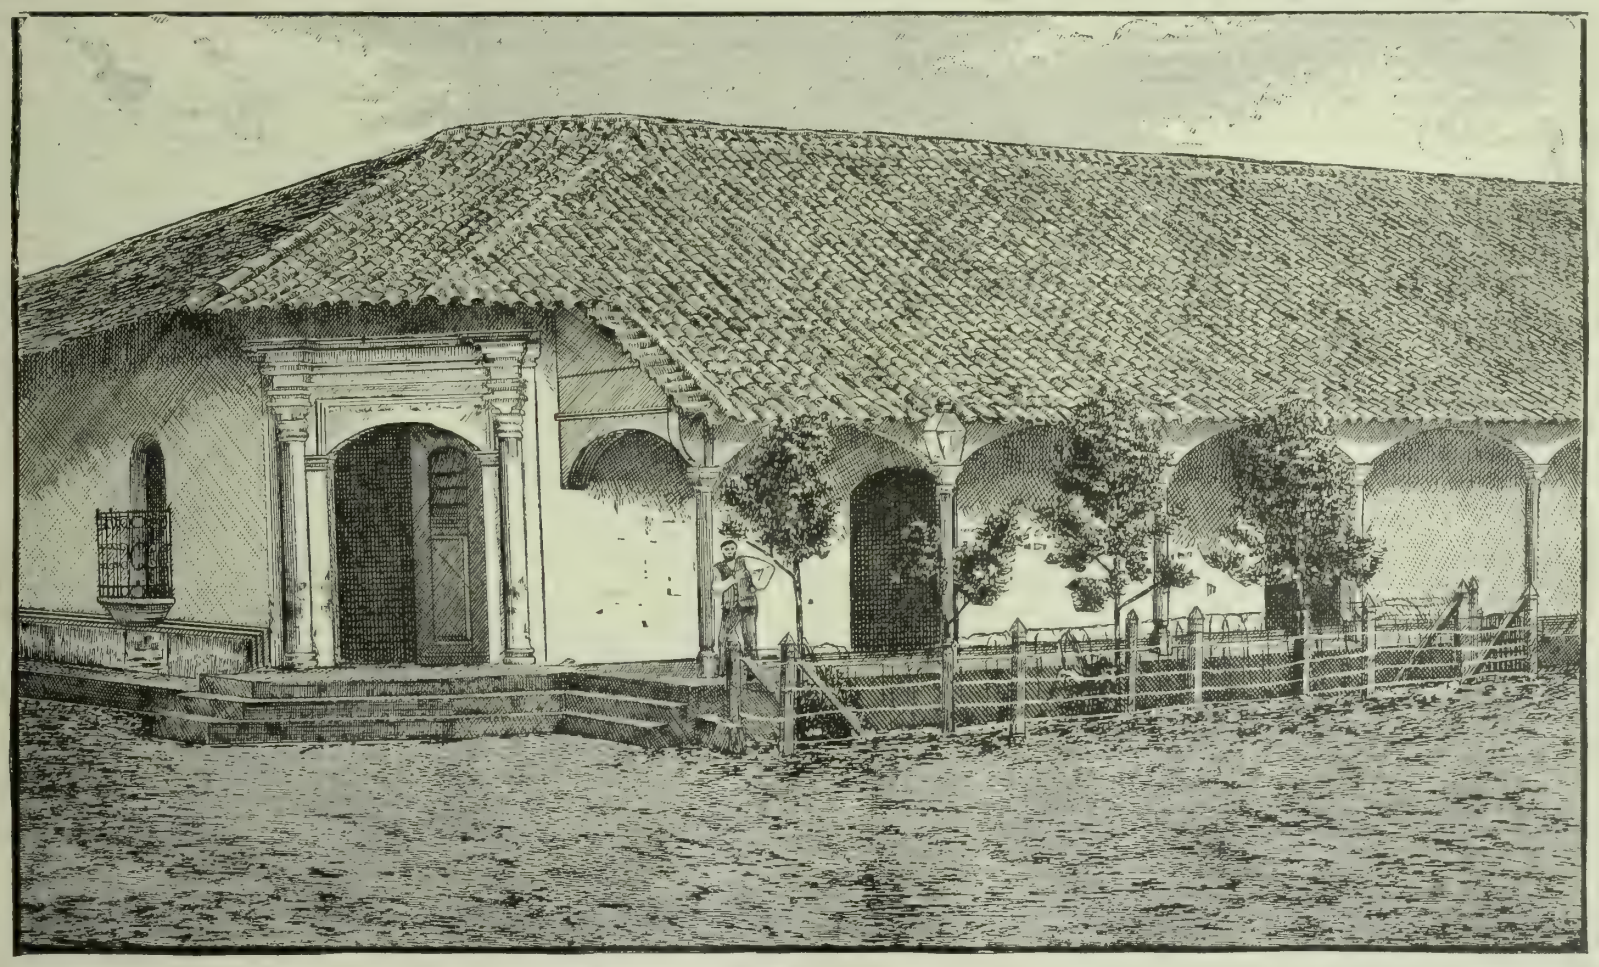
In our issue of August 16th we gave the full text of a bill introduced by Mr. Vandever and then pending in the House of Representatives providing for the reservation of Government lands covered with sequoias in Tulare county. Word now has come that the bill has passed the House after amendment, as suggested by the friends of the forest residing in the district, and that the following lands are to be reserved: Tp. 18 S., Range 30 E. (M. D. B. and M.); Tp. 18 S., Range 31 E; Secs. 31, 32, 33, 34, Tp. 17 S., Range 30 E. This area is suggested by the local promoters of the praiseworthy enterprise, and if this can now be secured, they hope to accomplish more when the next Congress meets. There is naturally a sharp issue between the timber-cutters and those who desire to save the trees, but the sentiment of the public at large is strongly in favor of preserving these splendid specimens of tree growth for the benefit of coming generations. The project now rests with the Senate, and there should be no hesitancy on their part to carry out the work so well begun in the House.

Few who have not been in the mountains can understand the destruction that is going on among these giant trees and the rapidity with which the land has recently passed from Government ownership. What remains, and it is very little, comparatively, should be saved from the lumberman's ax; and if anything is to be done, it must be done at once.

FLORIST AND GARDENER.

Fremontia Californica.

EDITORS PRESS:—At this time, when the world is hearing so much of Gen. Fremont, a brief notice of this tree named for him seems appropriate. He discovered it in crossing the Sierras over 40 years ago. It grows at 2000 to 4000 feet altitude. When in bloom, 'tis one of the most showy trees of the Sierra brushlands. It is completely covered with beautiful yellow blossoms a hand's breadth across. The objection to it as an ornamental is the short length of time it remains in bloom, which rarely exceeds two weeks. It sometimes attains a hight of 30 feet and one foot diameter of trunk, but is usually smaller. In botany it belongs to the order *Sterculiaceæ*, and combines in its botanical characteristics something of the mallow and the basswood. Its leaves are rounded, five to seven lobed, resembling the fig, but smaller, and clothed with rusty hairs underneath. The seedpods are as large as the end of a man's finger, ovoid in shape, with staminal cup at base. When ripe it splits into five portions, each of which contains a few black seeds. The bark so closely resembles slippery elm in taste and properties as to be hardly distinguishable. The wood is hard when seasoned. The branches are so tough and flexible that it has acquired the common name "leatherwood;" they're universally used by teamsters and equestrians for whips.



This tree is too tender for the climate of the Northern Atlantic States, but it has been successfully grown in the Southern States and in France and England. I have shipped considerable quantities of the seeds to European seedsmen. W. A. SANDERS.

Sanders, Cal.

Japanese Gardening in Los Angeles.

The Los Angeles *Express* gives an account of work in preparation for the chrysanthemum show in that city this fall which is interesting. All through the year the ladies in whose hands this enterprise rests have been diligently preparing for this second and more elaborate fair, which will open October 29th in the new Market hall and continue for ten days. The great chrysanthemum garden which occupies the entire space of the large yard back of Judge Widney's residence on Olive street, through the courtesy of Judge and Mrs. Widney, has been used exclusively for this purpose during the year. Here, under the watchful eye of an experienced Japanese gardener, the plants have been carefully nurtured and cultivated. Hama Shigeta has devoted his whole time to them for six months, and for the past three months has had two assistants to help him to care for his rapidly growing family of 4000 plants. There are from 700 to 1000 varieties, and Hama and his assistants care for them as tenderly and take as much pride in them as a mother does in a favorite child.

Some novel methods of gardening have been introduced quite unknown to American gardeners. To toughen and strengthen the plants, cooked beans are packed about the roots and other varieties are kept moist by covering the top of the soil with out grass. Some extremely fanciful devices are arranged as racks for the larger and more ambitious plants to climb upon. Parasols, birds with outstretched wings, frame-houses, etc., made from splinters furnish support to the branches and form another illustration of that love for the artistic, and almost fantastic, we might say, which seems an inborn trait of the Japanese nation. A pile of 20,400 sticks in one corner of the yard had just been received and gives one an idea of the amount of work and material necessary to rear these petted children of the soil. Many of the chrysanthemums are already in jars ready for transportation to the fair, and many others are growing in tiers upon the garden terraces. These must be transplanted, and Hama will accomplish this feat as follows: A week before the time for removal, he will carefully cut around each plant, several inches back from the root, severing the small tendrils which reach out on all sides. He will then immediately replace the plants with the earth clinging to the roots, and the cut and bleeding tendrils will have a chance to heal and callous over before they are finally removed to the pots.

EXTERIOR OF A TYPICAL NICARAGUA HOUSE.

THE VETERINARIAN.

Milk Fever.

EDITORS PRESS:—What is milk fever, the symptoms and cure?—R. H. B, *Riverside.*

EDITORS PRESS:—The names Parturient Apoplexy—"Puerperal Fever," "Milk Fever," "Dropping after Calving," all apply to a disease peculiar to the cow, and it generally occurs within three days after calving. Good milkers are more predisposed to this disorder, also aged animals, it being rarely seen in a cow before the third calf. It is most often seen after the fifth, and an animal once attacked is more liable to another attack when parturition occurs again. Animals that are in a plethoric condition are more susceptible to milk fever. I have seen three cases which occurred previous to calving.

Symptoms.

The animal about four hours after calving becomes restless, raises the hind feet alternately, breathes quicker than usual, and when made to move, staggers behind. The animal ceases to eat, there is cessation of rumination, a wild look in the eyes, and the supply of milk suddenly fails. In about 24 hours the cow falls; she tries to get up but is paralyzed behind. The eyes then protrude and become bloodshot, and are very often insensible to touch. The pulse is full and soft and often slow, but very soon becomes faster, and finally imperceptible. The breathing is slow and irregular, and after awhile stertorous. The horns are hot, and the mucous membranes become purple. Delirium sets in, and the animal dashes its head about with great violence, or else becomes comatose, and lies with the head turned around to the shoulder. The eye becomes glassy; there is twitching of the muscles of the eyelids. The udder generally becomes flaccid, but sometimes becomes hard and small. The power of deglutition is lost, the bowels are constipated, and no urine is discharged. The rumen or paunch is distended with gas. *After death* the blood is found to be dark in color and the veins distended; petechiæ exist on the serous membranes, and there is congestion of the spinal cord.

Pathology.

Milk fever is a disorder of the sympathetic nervous system. In the milk cow this system is highly developed. Alimentation, lactation and interogestation are under its direct control. At calving, especially when it is rapidly accomplished, a large excess of blood is thrown upon the system. This causes sudden increase of blood pressure, and congestions and apoplectic lesions take place. When the udder is in a healthy condition, it is very active in removing the excess of nutritive blood constituents, while the watery matters and the different salts are removed by the other excretory organs.

The sudden loss of milk, retention of urine, constipation of the bowels, loss of power to swallow, are proofs that the functions presided over by the sympathetic gangliated cord are not duly performed in parturient apoplexy. The presence of coma, delirium and convulsions is thoroughly explicable, as due to congestion of the brain and spinal cord. There are several other theories as to the nature of the disease that I might give, but think it unnecessary.

Treatment.

Prophylactic treatment consists in having the animal in a healthy condition about the time of calving. Allow plenty of exercise and adopt other measures to prevent plethora. It is even necessary in some instances to purge and bleed.

In the *early stages*, bleed from the jugular vein, and sufficient to affect the pulse. Give a powerful cathartic. This must be done in all cases and at any stage of the disorder, as the bowels must be moved as quickly as possible, and it is extraordinary the amount of purging medicines that may be given before the bowels respond, due to the distention of the blood-vessels which prevents their absorption.

The animal must be milked regularly, supported with bundles of straw to prevent lying flat on the side, also must be covered with blankets, and apply friction all over the body. Apply ice or cold water to the forehead. The most important part of the treatment is the frequent giving of diffusable stimulants to rouse the sympathetic system into activity. I also advise the application of a stimulating liniment along the spine. Injections per anus must be frequently given, and the urine drawn off with a catheter. When the act of swallowing is impaired, the medicines must be given through a probang introduced into the œsophagus (gul-

let). I frequently introduce the trochar and canula, and administer the stimulating doses through the canula. (Insert the trochar and canula the same as you would for hoven, or bloat.)

When the animal is recovering, you must be very careful in the feeding; in fact, nothing but gruel must be allowed for some time. If paralysis of the hind parts continues, stryohnia must be given, and blister over the spine. When there are no signs of improvement after a short treatment, have the animal put out of her misery. A. E. BUZARD, M. R. C. V. S. L.

11 Seventh St., S. F

AGRICULTURAL NOTES

CALIFORNIA

Butte.

ABOUT IRRIGATION.—Oroville *Register*, Aug. 14: During the past two or three years there has been considerable discussion in this region as to the amount of water needed for irrigating an acre of orange trees. This year the question has been pretty definitely settled. The Palermo Co. run 600 inches of water to Palermo, and this serves to irrigate 1800 acres of fruit trees. To be sure these are not all orange trees, but most of them are. At this rate one inch of water, ordinary miner's measurement, will irrigate three acres of land. Upon the same basis, a canal carrying 8000 inches of water will irrigate 24,000 acres of land. It was thought the Big Bend Co. would bring in a ditch with from 8000 to 10,000 inches of water. It is quite certain that a still larger canal will be taken from the river by the Golden Feather Co. It will be readily seen what an enormous area of land can be irrigated from Feather river, yet hardly lessen the quantity of water in the stream.

Colusa.

WHEAT YIELD.—Williams *Farmer*, Aug. 23: J. O. Zumwalt stored some wheat in W. H. Williams' warehouse that averaged 153 pounds to the sack and 15 sacks to the acre, making 2295 pounds, or 38½ bushels to the acre. This is from land lying within two miles of Williams, and demonstrates the fact that after a thorough wetting, such as the ground received the past winter, it will produce as well as ever. W. R. Tully has also delivered grain at the Stovall-Wilcoxson warehouse that averaged 146 pounds to the sack and 36½ bushels to the acre.

Contra Costa.

LARGE RESERVOIR.—Martinez *Democrat*, Aug. 23: The Union Stockyards Company has commenced work on its large reservoir in Rodeo valley. About 60 men are engaged in digging pits for the purpose of testing the ground for a foundation for the dam. The dam will be 100 feet high and 1000 feet long, and will be built of earth, concrete and clay puddle. It will be situated between Martinez and Pinole, in Rodeo valley, about four miles from Pinole. The reservoir, when completed, will be 1¾ miles in length and will cover all of the lower part of Rodeo valley. It is estimated that it will hold over a billion gallons of water, and will drain a watershed of 7000 acres.

Kern.

DAIRYING—COLONIZATION—QUICK RETURNS. Bakersfield *Echo*, Aug. 21: Poor prices for butter and cheese are causing quite a decline in the dairy business here. The Mountain View dairy has entirely suspended operations, a number of the cows being turned out and the remainder of them being transferred to other ranches. The Anderson ranch is now keeping but 150 milch cows, when two or three times that many were formerly kept there. No cheese at all is being made there, the price being considered too low....About 300 head of horses are now employed at Rosedale in extending the canals to new lands to be colonized this winter. Mr. Carr stated, a few days ago, that since operations were begun there last fall, 60 miles of canal have been made, all for the purpose of conveying water to lands that have been and are to be settled in small tracts. He is very anxious to employ more men and teams so that he may be able to supply four sections a month with water. The colonization agents assure him that this amount of land will be needed to supply the demands of immigration this fall and winter. Another party of farmers will leave England in September, and several parties are forming in various parts of the Eastern States to start about that time also. The present season has been so satisfactory to those who settled here last spring that they are writing the most favorable letters back to their friends...."The greatest wonder to me is that fig culture does not attract more attention than it does," said a gentleman who has kept an eye on fruit interests generally. "Few trees begin to fruit earlier in life than the fig, and none live to a greater age and bear more regularly. Why, a fig tree begins to bear at a very tender age, almost before you realize that you have a tree. I was passing Isaac Gambel's place, in the edge of town, a few days ago, and noticed his young fig trees. They were put out a year ago last spring as cuttings and now they are full of fruit. You hardly believe it, and still it is true, as you may see for yourself; and that is not an extraordinary case, either, for the tree habitually bears when young."

Los Angeles.

ORANGE ORCHARDS.—Pomona *Progress*, Aug. 21: The young orange orchards on the Packard Orange Tract are most interesting. They are growing superbly, and one cannot imagine better kept pieces of land. There were over 13,000 trees planted on the tract last winter, and of these less than 50 have failed to thrive. A force of workmen is kept constantly employed in irrigating and cultivating the land. Not a weed is to be seen on any of the cultivated land, and stones of more than an inch in diameter are strangers to the place. The planting of orange trees on the Packard Tract next winter will be larger than ever, and more improvements are to be made in new roads, shade trees, shrubbery, etc.

Mendocino.

CREAMERY AND MILK—FRUITS AND TREE STUMPS.—Mendocino *Beacon*, Aug. 23: The Humboldt Creamery is now paying $1 per 100 pounds for milk. This is equivalent to 25 cents per pound clear for butter....A visit to the orchard of Mr. Gorrell on Navarro Ridge will convince the most skeptical that good fruit can be raised very near the coast. He has a dozen varieties of apple, some of which are of excellent flavor and size. Besides apple, he has several large bearing trees each of pear, peach, plum, cherry and crab. Of small fruits he raises every year currants, gooseberry, raspberry, blackberry, strawberry and grapes. One of the striking features of this orchard is the number and size of the redwood stumps scattered among the fruit trees. Mr. Gorrell says they act as reservoirs of moisture, and are a benefit to the orchard.

HOPS.—Ukiah *Dispatch and Democrat*, Aug. 22: A few sales were made the first of the week at 25 cents. Twenty-seven and one-half cents was offered on Wednesday, but no takers. Hop-picking will be in full blast the first of next week. A few parties picked small quantities this week. Among those who began picking hops this week were Bartlett Bros., Hugh Burk, Z. G. York, Thos. Rhodes and T. J. Fine. Growers generally, who have not already contracted, will not sell at any price.

Mono.

STOCK SOLD.—Bridgeport *Chronicle-Union*, Aug. 16: The cattle belonging to the estate of Louis Sammann, deceased, have been sold to Kirman & Rickey for $13 per head, 300 to be delivered on the 20th inst., and the balance by September 13th.

Monterey.

GRANARY BURNED.—Salinas *Index*, Aug. 21: The large granary belonging to M. Lynn, on the Buena Vista ranch, was destroyed by fire Aug. 20th. The building contained about 3000 sacks of feed and seed barley. The loss is estimated at $5000, with no insurance.

Orange.

IRRIGATION BONDS.—Anaheim *Gazette*, Aug. 21: A letter from C. C. Wright, author of the Act under which the irrigation districts of the State are working, written to a gentleman of San Bernardino, contains the following information: "Turlock Irrigation District has sold $130,000 of its bonds at 90 cents on the dollar. Modesto Irrigation District has sold $101,000 in bonds at 91 cents. Brown's Valley Irrigation District, Colusa county, has just sold a large amount of its bonds, but I do not know the exact amount. They received prices varying from 90 to 92 and 93 cents on the dollar. Alta district, situated in Tulare and Fresno counties, has purchased, with its bonds at par value, what is known as the 76 canal. This is the largest canal in California, being 130 feet in width, and has great capacity. The price paid for it was $410,000. I am only giving you such information as I know to be reliable. What I have stated above you are at liberty to make use of in any way you may deem proper. I challenge denial of any of the statements, and promise you if they are questioned I will furnish ample proof in their substantiation. The Grangers' Bank of San Francisco has held the funds that were realized from the sale of the Turlock bonds, and A. Montpellier, the cashier and manager of that bank, would readily settle any question as to whether the bonds of that district have actually been sold. I did not mention that in the case of Turlock and Modesto districts they have sold all the bonds which it is desired to sell at present. Turlock district made its sale of $310,000 about eight months ago and refused to sell any more bonds until the money should be needed in the prosecution of their work." Vineland Irrigation District, in Los Angeles county, has sold its bonds to the extent of $40,000; price not stated.

San Bernardino.

GOOD RETURNS.—Riverside *Press and Horticulturist*, Aug. 23: The orange crop from the Evans rancho and the lands of the Riverside Land & Irrigating Company the past season amounted to 14,912 boxes, 50 carloads of fruit. The orchards comprise about 195 acres, of which 75 acres are young orchard and yielded only about 500 boxes of the golden spheres. The crop was sold at an average of about $2 50 per box.

Shasta.

FRUIT.—Anderson *Enterprise*, Aug. 21: The fact that fruit-buyers are becoming so plentiful here is a recognition that we are becoming somewhat of a fruit-raising district. The cannery will in all probability turn out 4000 cases of peaches, 350 cases of blackberries, 250 cases of plums and pears and several carloads of dried fruit. A number of fruit-raisers are drying their own product.

San Diego.

LARGE CITRUS ORCHARDS.—San Diego *Sun*, Aug. 22: A company was organized in San Diego several months ago to go into the orange and lemon business upon a large scale. They purchased an entire nursery stock and secured 500 acres of land which they propose to plant to trees within the next two years.

GRAPE PICKING.—*San Diegan*, Aug. 23: Thomas O'Brien, who goes to the Cajon for the Vineyard Company, says the picking will begin on September 8th or thereabouts. The Vineyard Company alone will require 200 men, and at least 700 more will be used during the picking and packing season.

Solano.

HOW IT WORKS.—Dixon *Tribune*, Aug. 23: In an interview with Eli Snyder he says: "I commenced farming in 1886, purchasing in that season 90 acres of land, 1½ miles southeast of Davisville, wholly unimproved, for the greater part of which I went in debt. I planted the first season six acres of vineyard, three acres of peaches, five acres of pears. These are now in bearing, and will yield the present season about $1000. I have since added 15 acres of prunes, 30 of apricots, seven of nectarines and two of almonds, which will come into bearing by another season, when my orchard will begin to pay me; indeed, it is even now self-sustaining, and each season will add to the yield. The expense of taking care of it is trifling, since I contrive to do most of the work myself, besides raising vegetables, such as corn, potatoes and sometimes melons between the rows, and by means of these I have contrived to live without increasing my debt. My place is now worth in actual cash $10,000 more than I paid for it; in fact I have refused this advance. The present season I have 100,000 young trees to sell, besides about 70,000 grapevines, the profits of which will about clear me of debt."

Sonoma.

GOOD POLICY.—Santa Rosa *Democrat*, Aug. 23: The policy adopted by the San Francisco & North Pacific Railway Co. with regard to the fruit-packing industry of this city, is liberal and deserving of hearty commendation. Not only have special rates been made for shipping the fruit to and from this city, but a great reduction in fares to the employes in the canneries who live out of town has been made.

FRUIT AND HOPS.—Healdsburg *Enterprise*, Aug. 23: Wm. Mothorn will gather an average of 300 pounds per tree from his prune orchard this year, the trees being now in the second year of bearing. The crop was sold early in the season at $40 per ton, but $60 per ton could have been realized now had the grower held. ....The peaches raised on the G. D. Phillips place this season have been sold for 18 cents per pound, dried and unpeeled. This is a good price and nets the growers a handsome profit. ....At the Grant yard, hop-picking will be commenced Sept. 1st. All who desire work will be given excellent camp-ground, well shaded, with wood and running water conveniently at hand.

Stanislaus.

WATER RIGHTS.—Modesto *News*, Aug. 15: On Saturday the Turlock and Modesto Boards of Irrigation directors and their attorneys met in Modesto to discuss and agree upon a joint dam and joint water rights for the two districts. The agreement reached concerning the distribution of water was, that each district divide the water upon a basis of the acreage of each of the districts. It was further agreed that if either district in the future desired to acquire additional water rights, the other district is to be given 60 days' notice of such intention, and such district would have the option of paying one-half the cost and receiving one-half the benefit accruing from such additional water rights. The joint dam agreed upon will be about 15 feet higher than would have been constructed by the Modesto district were it to build a separate dam, but the additional hight will allow the district to go back of what is known as the Dominici bluff, which enables the construction of a canal more cheaply and more permanent than could be done at the lower elevation.

Tulare.

GRAPE PICKERS—BROOMCORN.—Hanford *Gazette*, Aug. 21: There is quite a stir among grape-growers now that the grapes are about ready to pick, and the inquiry for help is becoming more brisk. There will be no idle hands this season for want of work. A large number of the women and girls are preparing to enter the vineyards and earn their $1.50 to $2 per day....Ross Ludlow was disputed about growing broomcorn to maturity in 36 days, and on Monday last, four days after the statement, he brought in samples 14½ feet high, 40 days from the seed. A little figuring will show that it had to grow 4½ inches every day for the 40 days. As it took several days to sprout and get started, no doubt that some days it grew nearly two feet.

SORGHUM.—Porterville *Tidings*, Aug. 22: Mr. J. R. Graham on Upper Tule is making sorghum. We happened along there last week and saw the operation. He has three acres of cane from which he will get about 400 gallons of syrup, judging by the results so far. The mill cost about $60, the rest of the plant being home-made, consisting of a flue of brick on the ground about eight feet long and high enough to receive fuel, on top of which was laid the evaporating-pan, just large enough to cover the flue. Here the sap from the sorghum is boiled down, being skimmed while boiling. This is Mr. Graham's first experiment, and he thinks he could fit up much better another season and make a greater saving. Home-made sorghum of much poorer quality has been retailing on the river at $1 a gallon, and is preferred for family use to the San Francisco refinery's "Golden Drips" (largely glucose at 65 cents. Mr. Graham's syrup is of a light golden color and has a pleasant sub-acid flavor that is agreeable to most tastes. He received the seed from a neighbor and does not know the variety. He will readily get about 70 cents at wholesale for the syrup, and will net $175 to $200 profit from his three acres of cane.

HOME-DRIED FRUIT.—Tulare *Register*, Aug. 22: We have heard of one or two instances where housewives are drying peaches and nectarines picked from the trees in their yard. Where it is desired to have something besides canned fruit, this is a good idea. One or two hundred pounds of fruit may be dried with but little trouble. A few boards arranged where the sun can reach them is all the apparatus necessary, and to split the fruit and drop the pit out is the biggest part of the work. If it is desired to sulphur the fruit, that is a simple affair also. Get some ends or sides of boxes, of the same size, or any other boards for that matter; spread the fruit upon them, stack one on top of the other with slats between to keep the fruit untouched by the board above it, and cover the whole with a large box. Then put a few handfuls of sulphur on a shovel and burn it inside the box a few minutes, say a half-hour. Fruit can be dried for home use just as easily as it can be "put up."

WHEAT YIELD.—Deer Creek Cor. *Tidings*, Aug. 22: Threshing is in full blast and not more than half-done here yet, though several machines have come in from the coast and places in the San Joaquin valley, where crops were not so good and machines more plentiful. The wheat blockade at Deer creek switch, on the east side road, and also at Alila, on the main line, is greatly annoying ranchers and teamsters in this vicinity; also at Pixley it is frequently impossible to unload without nearly a whole day's delay. It seems as though the powers that be realize that during the season all the grain can be handled, and it is of little consequence to them if the rancher should have to delay his work and thereby sacrifice what little profit he might have realized on his crop, thus missing the first opportunity for several years of reducing the mortgage on his home.

LARGE ORCHARD.—Visalia *Times*, Aug. 21: W. D. Garland of San Francisco, owner of the Bacon ranch, nine miles southeast of this city, has contracted with W. C. and J. R. Pendergrass of this city to plant 320 acres of the place to peaches and prunes. Two hundred acres of the land will be planted this winter, and the remainder a year later.

Ventura.

ARTESIAN WELL—BEANS.—Saticoy, Aug. 20: Captain R. Sudden has sunk on his ranch an artesian well 190 feet deep, and a good flow of splendid cool water has been realized. This is the first artesian well on this side of the Santa Clara river. For 12 years previous water had been hauled on this place.....In speaking of the bean crop in Ventura county, Mr. Levy, a prominent business man of Hueneme and a close observer, estimates that this county will this year ship 1000 carloads of beans.

Yolo.

LARGE SHIPMENTS.—Winters *Express*, Aug. 23: Four hundred carloads of fruit have been shipped from Winters this season to date. This includes Eastern and local shipments by freight and express. Four hundred carloads equal 9,000,000 pounds. Think of what a vast pile of fruit that would make if thrown in a heap together. The season has yet two months or more to run, and shipments are being made every day.

Yuba.

WHEAT—BARLEY—SILO—DAIRY.—Marysville *Appeal*, Aug. 22: One of the wheat-buyers of this city informed us that the crops in Yuba and Sutter counties, judging from the amount of wheat which has been sold and that which he knew was held and stored, was really just about one-third of that of last year. In speaking of the wheat sold he said that proportionately more wheat had been sold this year, and in fact but little was stored. This, he stated, was largely due to the high prices that had been paid, and the scarcity of ready money.... The barley crop in Yuba and Sutter counties seems to have been entirely exhausted. There has been no barley for sale on the streets of Marysville for the past two or three weeks, and although the quotations here are only $1.40, a buyer says that if any was for sale here it would find a ready market at $1.50. The barley crop in these two counties has been much shorter in proportion than the wheat crop. The most observant buyers say that there was not one-sixth of a crop in this section....A large and fine barn is going up on the Hall farm, about five miles northeast of Marysville, on the Brown's Valley grade. This place is owned by Capt. Hall of the firm of Hall, Luhrs & Co., Sacramento. He is introducing some improvements that are new to California, or at least to this part of the State. Among them is a silo. This is found on many thousands of Eastern farms, but may need some description here. A silo is a cellar made as air tight as possible, with a cement floor and a close-fitting door or cover. In this silo, green fodder of any description, such as alfalfa, clover, green vegetables, corn or roots may be packed tightly, and will keep in a fresh and green condition for an indefinite period. The silo is regarded in the East as an invaluable aid to the farmer and stock-raiser. It is the intention of Capt. Hall to establish a large dairy industry on his place, for which it is well adapted.

The Botanist.

Grasses of the North Pacific Coast.

The State of Washington, rich in every respect in regard to flora, is also very well represented by numerous families of *graminæ*—that is, grasses. These grasses, some of them imported and some native, are of a very great economical value, consequently their description in a popular form will be probably welcomed by numerous readers. To give, however, an opportunity to the reader to be able to understand some of the botanical terms, and to distinguish practically one species of grass from the other, we will begin with a short introduction, after which will follow the description proper.

The grasses form the most widely diffused families of plants, growing as well in the cold countries as in the tropics. The cereals of our climate, as, for instance, wheat, rye, barley, are grasses, and so are also bamboos and sugar-cane of hot countries.

A grass is composed, like many other plants, of the following parts: First, the root; second, the stem; third, the leaves; and fourth, the flowers.

Root.—It is well known that many grasses are annual and they possess a tuft of numerous slender fibers. The longer-living graminæ have also fibrous roots, but they are thicker and less branched.

Stem.—The aerial leaf bearing branch or stem is called a culm. This culm is usually cylindrical and hollow, and conspicuously joined by the so-called nodes, which are a strong plate of tissue, tending to strengthen the stem. In some grasses, in addition to the culm, there are also the so called rhizomes—that is, horizontal subterranean stems, which usually bear a greater or less number of scales, and in other species again a few of the lower internodes become enlarged, forming a kind of bulb. This bulb forms nutriment stores in which are concentrated a mass of food for support of the plant under peculiar circumstances. Grass culms grow with great rapidity, and they are usually unbranched, except at the top, where they divide into branches of the panicle—that is, of the flowering part, though there are also grasses where leafy branches rise from the side nodes.

Leaves.—They are solitary at each node—that is, they are placed alternately on opposite sides of the culm at greater or less distances. They consist of three parts—the sheath, the ligule and the blade. The sheath is usually of great length, and often completely surrounds the culm. At the summit of the sheath, at the point where the blade of the leaf leaves the culm, is the so-called ligule, usually a small, thin membranous organ, usually erect and pressed around the culm. This ligule is sometimes absent, though quite rarely, and sometimes is represented by a tuft of hairs. The ligule is the same for the grasses what the stipules occurring at the base of the leaves are for higher plants. The blade or lamina is usually far much longer than broad, and is set on the sheath at an angle. It is generally known under the name of leaf. The venation consists of parallel nerves, the central nerve, called the midrib or mid-nerve, being usually strong and extending to the point of the leaf.

Flowers.—The flowers are generally at the end of the culm, or side branches, and they are variously arranged. Sometimes they are many; sometimes very few; sometimes in a panicle, with many spreading rays, that is, branches; sometimes in a close spike. They consist of the essential organs, and of the envelopes, the former being the stamens and pistils. The stamens, usually three in number, are composed of the anther and filament, the former being the small organ which contains the so-called pollen, or dust, fertilizing the pistil or female organ, the latter, that is, the filament, being the thread-like stem on which the anther is borne.

The central organ of the flower is the so-called pistil, consisting of the ovary, the style, and the stigmas. The style is usually divided into two branches, at the extremities of which are delicate organs, the stigmas receiving the pollen for the fertilization of the flower. The ovary is at the base and contains the future seed.

The stamens and pistil are generally inclosed between two leaf-like scales, or husks, facing each other, which are called the envelopes of the flower. One husk is higher on the axis than the other, and also more delicate, and usually smaller. The smaller husk is called the palet; the larger and coarser one is known under the name of the flowering glume.

If the flower is formed as above described, then, together with the pair of outer glumes at the base, it is called the spikelet. Usually there are, however, many flowers in a spikelet, arranged one above the other, with a pair of empty or outer glumes at the base of the cluster. Sometimes, again, the lower palet is prolonged into a bristle-like appendage, the so-called awn.

The ovary, in ripening, becomes a grain (caryopsis) which consists of the usually adherent pericarp of the hull, within which is the seed proper, consisting of a small embryo situated on the outside and at the base of a floury albumen. We must also mention here that at the base of the pistil are situated one or two minute scales (lodiculæ), which are usually very diminutive, but sometimes in some genera are as long as the ovary. Again, sometimes, the flowers are arranged in several rows on one side of a narrow, flattened branch, which is called a rhachis.

Having given a general outline of grasses, we will proceed now to the description of

Different Species of Graminæ,

Which are so abundant in this State. The genus *Beckmania* and *Panicum*, or different kinds of millet, are closely related to each other. The slough grass, *Beckmania crucæformis* var. *uniflorus*, grows abundantly in this State, and can be found near Seattle. It grows in tufts, its stout culms being about three feet high, and the thick leaves eight inches long and half an inch wide. The spikelets are crowded together on the one-sided spikes. The panicle is longer than the leaves, and also a little wider, and is composed of numerous short branches. It is an excellent grass for stock, especially the sterile shoots and bottom leaves. The *Panicum* has a spreading-branched panicle, the terminal branchlets of which are adorned with spikelets of a single perfect flower. This perfect flower has a thick, hard glume with a similar palet and with the pistil and stamens inclosed between them. This species is in some countries used for bread-making, and its name is from the Latin *panis*, bread. The barnyard grass, or *Panicum crus galli*, has thick culms, usually over three feet high, and it is said to furnish four tons of hay per acre. It requires no cultivation, and it annually reseeds the ground. The red-top panicum, *Panicum agrostoides*, grows in large clumps on the margin of lakes and rivers, and it is nearly twice as tall as the previous one. It is a good grass when young; it is found, however, only in a few moist localities in this State. The crab grass, *Panicum sanguinale*, is an introduced grass, and it is very seldom to be met with. It is three feet tall, and has at the summit from three to six slender flower spikes. At the lower joints the culms are sometimes bent and then they frequently take root. This grass is better and finer in the Southern than in the Northern States. The switch grass, or the fall panic grass, *Panicum virgatum*, grows mostly in the eastern counties, but it is also found on the seashore. It is nearly five feet high and grows in clumps.

The genus *Phalaris* is found everywhere in this State. This grass prefers wet ground, when it reaches the hight of over three feet. It has strong, creeping rhizomes and its culm is stout and smooth. The leaves are long, sometimes 10 inches, but only about half an inch wide. The reed canary grass is called *Phalaris arundinacea*, and the ribbon grass of our gardens is a variety of this grass.

The genus *Anthoxanthum* comes originally from Europe and its variation, the so-called sweet vernal grass, *Anthoxanthum odoratum*, is much employed as lawn grass on account of its slender culms and scanty foliage.

Of the genus *Alopecurus*, the so-called Rocky mountain foxtail, *Alopecurus occidentalis*, is indigenous in Eastern Washington, and the water foxtail, *Alopecurus geniculatus* var. *aristulatus*, is found in wet meadows in other parts of the State. The first one yields a larger quantity of fine hay than the second one, and both are no more than a foot in hight.

Of the genus *Stipa* we find a few species in the State. Stamens are usually three, spikelets one-flowered, and the flowering glume has a hardened, sharp and bearded pedicel or stipe at its base. This stipe is often dangerous to sheep, as it penetrates into the wool and into the flesh. The different species of this genus—that is, *Stipa spartea, Stipa comata, Stipa viridula*—are generally known under the name of beard grass, bunch grass and feather grass. *Stipa spartea* is also often called devil's knitting needles, porcupine grass and arrow grass, on account of its very long awns inclosing the seed. It is also sometimes called buffalo grass.

The *Aristida* is worthless grass, growing in bunches about one foot high. The flowers are purplish, with slender awns.

The regular bunch grass, *Oryzopsis cuspidata*, is a mountainous grass, growing in very dense tufts. The culms are nearly two feet high, with narrow leaves. The panicle is over five feet long, and the spikelets each one flowered. The glumes inclose an ovate flower covered with silky hairs, which is, however, not a flower, but the flowering glume of hard texture. It grows usually on the sandy soil.

The genus *Phleum* is a very common grass, and two of its species, *Phleum pratense*, or the so-called Herd's grass, and *Phleum alpinum*, are to be found near Seattle. It is cultivated in this State, and it makes excellent hay. Herd's grass was found by Timothy Herd in wet localities of New Hampshire, hence it is also known under the name of Timothy. The culm of this grass is erect, with leaves about five inches long, and the base of the culm is a little bulbous. The flower spike is densely flowered, and the roots are very fibrous. It is one of the most valuable of grasses and it yields large crops, and it can be raised almost in any soil, moist or loamy, sandy or gravelly. It is sometimes sown with clover, but it is better to have the timothy meadows free from other plants. The clear seed weighs 45 pounds to the bushel, and about 12 pounds ought to be sown to the acre.

Of the genus *Agrostis*, or the so-called red-top, finetop and bent grass, the *Agrostis exarata* grows abundant in all the parts of this State. It is three feet high, with a stout culm, with broadish leaves over five inches long. The panicle is also over five inches long and pale green. It makes good hay. Other species are *Agrostis requivalvis* and *Agrostis scabra*.

A very common grass in Washington is wood reed grass, *Cinna pendula*, of the genus *Cinna*. It is a slender grass, five feet high, with creeping rhizoma and with a long, loose, drooping panicle. It grows usually in swamps and shaded woods, and on account of its leafy culms is good for hay.

An excellent grass is also the so-called blue joint, or small reed grass, *Calamagrostis Canadensis*, found in moist meadows near the Canadian boundary. Its culms are from three to five feet high and very hollow, and the leaves are one foot long and about half an inch wide, flat and rough. The panicle is long and spreading, of a purplish color, the spikelets short-stalked, and at the base of the flowering plume are silky white hairs. The stem sheath is smooth. This very productive grass ought to be more cultivated in this State. The cattle relish it very much. Another species of this grass, *Calamagrostis sylvatica*, is also found in Washington in sandy localities. It grows in tufts and is more coarse than the previous one. It is also sometimes called bunch grass, and in the scientific world is known under the name of *Dryenxia sylvatica*.

The genus *Trisetum* is represented in this State by *Trisetum subspicatum*, a purely mountainous grass, sometimes only a few inches in hight and sometimes two feet. Its culms are erect and smooth, the panicle spike-like and the spikelets two or three flowered. It is a nutritious grass.

Now we are coming to the well-known grass, wild oats, *Avena fatua*, which is diffused almost all over the world. It does not differ very much from the cultivated oat, *Avena sativa*. It differs in the presence of the long twisted arm, in the smaller size of the grain, in having more flowers in the spikelets, and in brown hairs which cover the flowering glume. Though very good as fodder, the *Avena fatua* is injurious to any grain-field. The origin of the cultivated oat is believed to be wild oat, and Professor J. Buckman succeeded in raising "the potato-oat type" and "the white Tartarian oat" from grain of *Avena fatua*. There appears also to be a great tendency in the cultivated oat to degenerate on stiff clay soils into "weed oats."

The fall oat grass, evergreen grass, or meadow oat grass, *Arrhenatherum avenaceum*, is much valued on account of its rapid, vigorous growth and productive herbage. The culms are from two to four feet high, with four or five leaves each, the sheaths smooth but the leaves are rough. The spikelets are on short pedicels and the panicle is loose, nearly ten inches long. This grass is found but seldom in Washington.

The buffalo grass, *Buchloe dactyloides*, is a very low grass, scarcely rising three inches above the ground, and it grows in patches and tufts and spreads by means of off-shoots or stolons. These off-shoots are sometimes two feet long, with joints every few inches. It is a very valuable grass, but grows only on the level ground.

In the dry localities of this State, especially toward Oregon, is found *Kœleria cristata*, sometimes known under the name of June grass. It is usually over one foot high, the leaves short and the panicle a little over two inches long. In fertile soil it grows longer, and is then over two feet high.

The alkaline or salt grass, *Distichlis maritima*, is found only near Bellingham bay and in a few places in Eastern Washington. It has strong creeping root-stocks, culms about 18 inches high, and rigid, sharp-pointed leaves. It is not a first-rate grass.—*M. Lopatecki, Ph. D., in Seattle Post Intelligencer.*

Horticulture.

Observations in Japan.

EDITORS PRESS:—I arrived here after a somewhat unpleasant voyage of 16 days from San Francisco. The thermometer varied between 56° and 60° till the last four days, on account of the northerly route we were taking, when it rose to 70°. The distance made was 4650 miles, and we crossed the meridian of 180°, on the 10th day out, and so the 13th of June had no existence for any of us.

For a week after arrival we had hot weather, and one day up to 93°; then the rainy weather set in, and we may expect it daily for three or four weeks and the thermometer day and night at about 70°. I write this that you may compare the climate of this part of Japan with your own, so as to judge of the time the fruits grown here should ripen with you.

I find that the fruit-dealers know little about the names of the fruits they sell, and I have to depend on the nurseries or fruit-growers. I can hear of no plum called "Botan," but the "Botankio," a roundish large plum, is just coming into the market hard and green. The stone is not as small as the Hattankio nor is the plum as large. The latter is just now appearing at the stalls, and while the Botankio is round with a point like a pimple, and turns from green to a beautiful golden, the Hattankio is a conical fruit. I have never seen the "Botankio" in California, but think it ought to be popular, as it keeps well and the samples I have had for four days are turning color and ripening with a delicious perfume. The Hattankio ripens a purple, in some instances of a dirty, unsightly appearance and in others a very handsome rich color. Why this difference I do not yet know.

You know the Japanese pick all their fruit hard and green and eat it so, but the main use of fruit seems to be eaten as a condiment (with rice), sun-dried and salted or pickled. They are unacquainted with the lusciousnes of a sun-ripened peach, and even to the babies are given the hard, red-fleshed small peaches, called "Watermelon" peaches on account of the color. It is no wonder that cholera is common and has already appeared in Nagasaki when such fruit is not prohibited from being sold.

A good deal has been said about the *Citrus trifoliata* being a dwarf tree, but if left to grow it reaches 25 feet or more. The Japanese have no use for it at that hight, using it for a grafting stock or hedges of about six feet high trained to grow even between framework of split bamboo. Just now the new shoots are growing six feet above the fences and will soon need trimming off.

The late rains have started vegetation, but the weeds do not grow in such quantities as in California, and are easily removed with the hoe.

There seems to be an impression in Florida that the Oonshiu orange is called Satsuma because grown in that province, whereas the fact is that there are none there of importance, Kishiu is the province where they are mostly grown. I had the pleasure of a long interview with Prof. Tamari of the Agricultural College, Tokio, and he knows of Oonshiu trees at Hakone, and believes the cold there is as low as 10° Fah. He considers it will stand that degree of cold. As it has already stood still lower cold in America, any statistics from here are superfluous. H. E. AMOORE.

Yokohama, Japan July 17.

A Fruit Farm Near Pasadena.

Mrs. Jeanne C. Carr sends us the following clipping from the Pasadena *Tribune*, stating that she can verify the statements made therein, and certainly they are interesting:

One has but to take a drive in any direction from Los Angeles to get some idea of the immense crop of fruit now being gathered in this vicinity.

Yesterday a *Tribune* reporter visited the ranch of C. C. Thompson, just north of Pasadena, which the residents look upon as a model fruit farm, and take pride in showing visitors its products.

Mr. Thompson purchased the 80 acres of land comprising the ranch about eight years ago, and in the past six years has planted 60 acres of the tract to peaches, prunes, pears and plums, selecting only the best varieties obtainable. This season the crop is phenomenal, and has been raised entirely without irrigation. The reporter was shown through the orchard, and found the trees airly overburdened with fruit. The peach crop was well under way and had nearly all been gathered, but there were several tons of Orange Cling and Crawford peaches still on the trees. Samples of the fruit on nearly every tree were found to measure from 12 to 15 inches in circumference. The crop has been sold to the Monrovia Company at a very remunerative figure.

The prune crop is especially noticeable. The trees are laden with German, French, Hungarian and Silver prunes, and present in their many and varied colors a beautiful sight. Mr. Thompson is curing this crop himself, as he finds it pays better than to sell the fruit on the trees. He has 14 men employed, and at his "drying-ground" has constructed a miniature railway, having laid tracks in several directions from the place where the fruit is dipped. After this process is gone through with, the trays are placed on trucks and distributed over the ground. The capacity of the force is ten tons per day, and he is working to the full limit. He will realize nearly $3000 from his peach crop alone, and possibly $5000 from other fruits.

The total income from the 80 acres will not fall below $10,000, and this produced by fruit on which not a drop of water was used for irrigation. A year or so ago he was offered $125,000 for the 80 acres but refused to sell. He and his estimable wife are justly proud of their success and take pleasure in showing the fruits of their toil.

Will They Die?

EDITORS PRESS:—What are the after effects of last winter's excess of water on trees that did not die but are manifestly badly affected?

I had 60 trees, prunes and walnuts (three years old) killed by water, and about 100 affected.

The prunes are badly gummed and the trunks are blackened, but have made a very good growth, five to seven feet.

The walnuts have made almost no growth, and the foliage does not look healthy. Some have grown only four or five inches and others two feet or more.

Will these trees be liable to grow healthy another year or sicken and die?

Carpinteria, Cal. J. W. ANDERSON

[What can growers say about these points?—EDS.]

MONARCH STRAWBERRIES AT SANTA BARBARA.—At the last meeting of the Santa Barbara Horticultural Society, Mr. Delos Wood

presented a box of strawberries of magnificent size and delicious quality, giving a statement as follows: "This kind of large strawberry, double the usual size and of fine flavor, is called 'Monarch of the West.' I grow them on a one quarter acre of ground, and irrigate by a one-half-inch pipe. The yield has been for a month past from 75 to 100 boxes per day, selling at about six cents per box, wholesale price, while other kinds bring only half that sum. I expect to pick and sell at that rate for two months longer."

California's Stallions.

I beg to announce that, with a view of perpetuating the forms and characteristics of the leading stallions of California, I am issuing a series of lithographic likenesses. Each portrait issued will be an acknowledged likeness, the result of a close study of the horse and an artistic treatment of the subject In order to secure for the series an immense advertising value, from a breeder's point of view, 4000 copies, at least, of each portrait will be issued.

Terms, $100 for first issue of 100 copies. In quantity, for advertising purposes, copies will be furnished at low rates.

H. Boyd, Artist.

268 Golden Gate Ave., San Francisco.

Dewey & Co.'s Scientific Press Patent Agency.

Our U. S. and Foreign Patent Agency presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American and foreign reports, files of scientific and mechanical publications, etc. All worthy inventions patented through our Agency will have the benefit of an illustration or a description in the Mining and Scientific Press. We transact every branch of Patent business, and obtain Patents in all countries which grant protection to inventors. The large majority of U. S. and Foreign Patents issued to inventors on the Pacific Coast have been obtained through our Agency. We can give the best and most *reliable* advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and Circulars free.

Fabiola Hospital, Oakland.

We cordially indorse the following article which has been sent to us by our correspondent:

In 1876 Mrs. R. W. Kirkham and other charitably disposed ladies of Oakland met together for the purpose of starting a homeopathic hospital and dispensary. Each of them subscribed liberally toward this object, and having secured the gratuitous co-operation of a number of Oakland's most skillful homeopathic physicians and surgeons, they took a small building on Market street and started under the name of the Oakland Homeopathic Hospital and Dispensary Association.

In 1883 a still larger building was purchased, but in less than three years this also proved too small for the demand.

The late Anthony Chabot then generously donated two and one-half acres of land on the corner of Moss avenue and New Broadway as a site for the erection of a building of adequate size. Many of Oakland's wealthy and generousmen then came forward, and, by liberal donations, helped the good cause along. Prominent among these was Frederick Delger, who gave the munificent sum of $5000. And soon the building depicted on this page was erected and dedicated with appropriate ceremonies. To it the name "Fabiola Hospital" was given, in honor of Fabiola, a Roman lady of the fourth century, who first founded a public hospital, thus inaugurating "a charity that has overspread the world and will, to the end of time, alleviate the anguish of humanity."

FABIOLA HOSPITAL, OAKLAND, CAL.

Those who have had an opportunity of visiting and inspecting it, will have a better idea of the incomparable advantages it possesses as a home for invalids than any description can afford. But there are many persons who look upon a hospital as much the same thing as a prison, and expect to see nothing but gloom and misery in both. Could these people but pay a visit to the above institution, their views would soon be changed; for they would find a pleasant home where the misery necessarily attendant upon sickness is reduced to a minimum.

A healthier or pleasanter site could scarcely have been chosen. In a quiet neighborhood, surrounded by picturesque scenery, the air pure and bracing, it is no wonder that the patients treated there are contented and happy, even in their sufferings. The best surgical and medical skill that Oakland can afford is in constant attendance at the hospital, all the service being gratuitous.

Although the hospital is a homeopathic institution, through the courtesy and liberality of the ladies composing the Board of Directors, allopathic patients are admitted and allowed to have allopathic physicians attend them.

Besides the medical attention, patients have the most devoted care from a corps of trained nurses. The training of nurses for the care of the sick is one of the most important works done by the hospital. Young men and women fulfilling the requisite conditions are admitted to the training school and receive a thorough training in the various branches of a nurse's work. The course extends over two years, at the end of which time (the final examination having been passed) a diploma is presented, certifying to the recipient's knowledge of nursing, ability and good character. This school is being largely taken advantage of and will be increased as the hospital itself increases in size. It will not be very long before this takes place, as the Directors are now erecting an annex which will have accommodations for 40 more patients, that is, will nearly double the present capacity of the building.

The hospital admits three classes of patients, irrespective of sex, nationality or creed: First, those who are destitute and unable to pay anything; second, those whose means do not enable them to pay for medical attendance at home; third, those who desire the hospital advantages as private patients. Those suffering from contagious diseases are not admitted. Patients are received upon recommendation of two or more of the Directors and a written order of admission signed by the physician who is to have charge of the case.

The following are the officers of the institution:

Honorary President, Mrs. R. W. Kirkham.
President, Mrs. John Yule.
Vice Presidents, Mrs. Remi Chabot, Mrs. D. B Hinkley and Mrs. J. A. Folger.
Corresponding Secretary, Mrs. Eleanor S. Doering.
Recording Secretary, Mrs. G. M. Stolp.
Treasurer, Mrs. Q. A. Chase.
Auditors, Mrs. Peder Sather, Mrs. R. N. Garrill, Mrs. S. M. Snook.
Board of Directors, Mrs. D. B. Hinkley, Mrs. Remi Chabot, Mrs. W. W. Standeford, Mrs. J. A. Folger, Mrs. Peder Sather, Mrs. Wallace Everson, Mrs. W. W. Cameron, Mrs. Q. A. Chase, Mrs. W. S. Snook, Mrs. G. M. Stolp, Mrs. John Yule.

Board of Managers, Mrs. Annie V. Chamberlain, Mrs. D. S. Austin, Mrs. S. M. Gilman, Mrs. P. M. Remillard, Mrs. Nelson W. Winton, Mrs. J. C. Kimball, Mrs. D. C. Hayes, Mrs. I. G. Harrison, O. C. Wheeler, Mrs. F. Chapman, Mrs. N. W. Murray, Mrs. J. G. Edwards, Mrs. J. T. Carothers, Mrs. Albert Brown, Mrs. Eleanor S. Doering, Mrs. Wm. R. Davis, Mrs. J. S. Emery, Mrs. F. D. Hinds, Mrs. A. F. Gunn, Miss Sarah Snell.

Advisory Board, Mr. F. Delger, Mr. Q. A. Chase, Gen. R. W. Kirkham, Mr. Thos. Crellin, Capt. Asa Simpson, Mr. Hiram Tubbs, Mr. P. N. Remillard, Mr. John Glascock.

During the year just closed over 150 patients were admitted. This does not include those who have been treated at the "Free Clinic" connected with the hospital, in charge of Dr. S. I. Fenton, the resident physician.

Such an institution speaks volumes for Oakland, and well deserves the hearty support of all who feel any sympathy for suffering humanity. Long may it stand and increase its sphere of usefulness—a splendid monument to the noble charity of those kind men and women who have brought it to its present high standard, and to the progress which the great truth of homeopathy has made in "the Athens of the Pacific." R. W. W.

The following brief list by telegraph for Aug. 26 will appear more complete on receipt of mail advices:

California—Alfred Brumwell and M. F. Doolittle, Kansas City, Mo., assignors of one-third to J. M. Thompson, S. F., cable-grip; Ellswood Chaffey, Santa Monica, mechanism for transmitting power; Frank M. Merrill, Oakland, comoressed air street-car motor; Henry E. Skinner, assignor to A. T. Allen, S. F., trolling spoon Washington—August F Baatz, Bellingham, railway brake; Frederick Ban, Tacoma, soldering iron.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

DIXIE THOMPSON of Santa Barbara county has a field of 2300 acres of beans to look after these days.

J. H. White's Sale of Cattle and Horses.

There has been no offering of high-bred stock within the past year that has attracted more attention than the proposed public sale at auction of herd of Holsteins and the high-bred horses of Mr. J. H. White of Lakeville, Sonoma Co.

Full description of some of the Holsteins has been given in the RURAL during the last two years, and it has been generally conceded that this herd was among the most notable and bred from the best strains of this class of cattle. The Petaluma *Argus*, published near the home of Mr. White, in last week's issue says:

The horses and cattle owned by J. H. White of the Lakeville Stock Farm are to be sold by auction in San Francisco on Thursday and Friday, Sept. 4 and 5, 1890, at the Railroad Stables, corner of Steiner and Turk streets.

This sale is a matter of so much importance to the farmers, stock-raisers and the people in general, in this section of the State, that it is entitled to more than a passing notice. It is scarcely worth while to mention the fact that it costs no more to raise a fine animal than a scrub, after once getting a start. This is evidently a stock county. One of the principal sources of profit is from horses, and our county is fast taking rank among the leaders in this great industry. Only by breeding the best strains of horses and cattle can we maintain an equality with Kentucky and some of the Eastern States, and attract buyers from abroad.

The catalogue contains the pedigree of 48 horses and 105 cattle. The horses are all well bred and many of the colts and fillies are of the most popular strains and contain the blood of the most noted performers of the present day. There are 30 colts and fillies that are so finely bred that we would hardly know how to choose from among them, and if we had a stock ranch would buy them all. Take for example the weanling filly, by Contention, he by Director, dam Miss Helen by Gen. Benton; first dam Miss Kohl by Arthurton, second dam by Speculation. Or the bay filly by Hernani, son of the great Electioneer—Gipsy by Paul's Abdallah, he by Hambletonian 10; its first dam by Gen. McClellan, second dam by Boston, third dam by Medoc. Or the pacing filly by Marco, out of Nellie Requa by Alexander's Abdallah. Or the filly by Admont, first dam by Arthurton, second dam by Speculation. We could continue this to the end of the column with equally good ones, and will have to close by advising our readers to get a copy of the catalogue and give it a careful perusal. Annetto, by Anteeo and Emma Volo, by Antevolo, the property of M. O'Reilly, will be offered at the same sale.

The Holstein-Friesian cattle are now universally admitted to be among the very best "all round" cattle in the country, and Mr. White's lot of 105 were from the pick of Holland. There is no chance to make a mistake in buying any of these cattle, as they are all registered and from the best milk strains.

Traction Engines.

A RURAL representative visited the agricultural works and machine shops of Daniel Best at San Leandro one day last week. The full force of men is at work on traction engines at present, on two of which the finishing touches are being given for exhibition at the State Fair in September. There were a number of visitors present, among whom was Mr. A. Liebes from the City of Mexico, who has been inspecting the various traction engines now being constructed in this State. He has in view the purchase of several of these engines for hauling silver ore and timber in Mexico, and if their capability proves what is claimed for them, he has no doubt that he will have a demand for 100 or more.

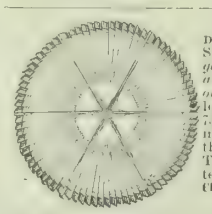
Look for Good Things.

A man educated will succeed the best, a mechanic with the best tools will do the finest work and whoever presides in the kitchen will obtain the best results with the least trouble when supplied with the best appliances.

The combination frying-pan and toaster is a case in point. It will give you a juicy steak and elegant toast whether over coals or a smoky fire. Cook onions or anything without the odor penetrating the house. Can be used over coal, wood or gasoline with equal facility. Then comes the improved baker and roaster; using this, no burnt bread is possible, does its own basting. Retains all the vapors arising while roasting, a delicious gravy is the result and the meat made juicy and tender. Other indispensable novelties for kitchen use found only at the Novelty Hardware Co., 1433 Market St. Send for circulars.

The Secret of Success.

The success that Messrs. Loomis & Nyman of Tiffin, O., have met with in the manufacture of Well-Boring Machinery is due largely to the fact that they have every facility for manufacturing first-class machines, and are thoroughly responsible in all dealings, and have been engaged in the business for over 30 years. Also by a liberal patronage of the newspapers. Their advertisement of "Bore Wells" is familiar to most readers. All persons interested in the subject should write for catalogue to Messrs. Loomis & Nyman, Tiffin, Ohio.



APIARIAN SUPPLIES.

Italian Queens, $2.50 each; Black Queens, $1 each. Swarms from $2.50 each; Smoker, $1. Comb Foundation, $1.25 per pound; V-groove Sections, $4 per 1000 Comb Honey wholesale and retail; Hives, etc. W. STVAN & SON, The Homestead Apiary, San Mateo, Cal.

San Francisco, Cal., Oct. 22, 1888. **PETER SAXE & SON, Lick House, S. F.**

Important Auction Sale

— OF —

Standard and High-Bred Trotting Horses

— AND —

THOROUGHBRED HOLSTEIN CATTLE.

Property of J. H. WHITE, Esq., Lakeville, Sonoma County, Cal.

On Thursday and Friday, September 4th & 5th, 1890.

At RAILROAD STABLES, Cor. Turk and Steiner Sts., San Francisco.

On account of a contemplated change in business, we are authorized by Mr. White to dispose of all the high bred stock upon his noted breeding farm at Lakeville, Sonoma County. This comprises over forty head of high-bred Trotting Stallions, Brood Mares, Colts and Fillies, most of them standard and all exceptionally fine individuals. They consist of the get of Stallions by Electioneer, Director, Antevolo and other noted horses. Most of the brood mares are with foal by Hernani, one of Electioneer's most prominent sons. Several have been bred to Director. Taken collectively they are, in size and form, the finest looking lot of trotters yet off red in California, and their breeding is upon the most approved speed lines.

The cattle comprise over one hundred head of thoroughbred registered Holstein Cattle. The progenitors of this herd were selected of the choicest strains upon the famous breeding establishments East, and have been judiciously crossed with a view to develop to the fullest extent the milking strains. Mr. White has expended a large sum of money and great care in perfecting this band of cattle, and can justly claim it as one of the superior herds of the United States.

Catalogues are being prepared and will be sent on application only. Horses and cattle may be seen at ranch six miles from Petaluma.

KILLIP & CO, Auctioneers, 22 Montgomery St., San Francisco.

THIRD ANNUAL AUCTION

— OF —

HOLSTEIN-FRIESIAN CATTLE

At SACRAMENTO, September 13, 1890.

By order of **FRANK H. BURKE of Menlo Park** we will sell, without reserve, Bulls, Cows and Heifers. Included in this sale will be all of the celebrated PRIZE-WINNING ANIMALS, and the winners of Sweepstakes and Gold Medals during the past year, about 30 head in all.

These animals are ALL THOROUGHBRED AND REGISTERED and from the choicest families, including the AAGGIES, NETHERLANDS, JACOBS, MENLOS and TWISKS. It is the only offering ever made on this Coast of these extra fine butter and milk tribes.

S. F. Market Report

Market Review.

DOMESTIC PRODUCE, ETC.

SAN FRANCISCO, Aug. 27, 1890.

The weather the past week continued favorable for fruit-dryers, who are taking full advantage of it. Fears are expressed that we may have early rains, and if so, much damage may have to be met by late driers. In all kinds of farm products trading has been fairly active at good prices, particularly in cereals. Wheat at the East and abroad has fluctuated at strong prices. The following is to-day's press cablegram:

LIVERPOOL, Aug. 27.—Wheat—Firmer. California spot lots, 7s 6d to 7s 9½d; cargoes off coast, 38s 9d; just shipped, 38s 6d; nearly due, 38s 9d; cargoes off coast, stronger; on passage very strong at extreme prices; Mark Lane wheat, turn dearer; in Paris, quiet.

Liverpool Wheat Market.

The following are the closing prices paid for wheat options per ctl. for the past week:

	Aug.	Sept.	Oct.	Nov.	Dec
Thursday	7s6d	7s6½d	7s6½d	7s6d	7s6½d
Friday	7s7½d	7s7½d	7s8½	7s8d	7s8½d
Saturday	7s7½d	7s7½d	7s8½	7s8d	7s8½d
Monday	7s8½d	7s8½d	7s8½d	7s8½d	7s11d
Tuesday	7s8½d	7s8½d	7s8½d	7s8½d	7s8½d

The following are the prices for California cargoes for off coast, nearly due and prompt shipments for the past week:

	O. C.	P. S.	N. D.	Market.
Thursday	38s9d	38s6d	38s9d	Firm.
Friday	[illegible]	[illegible]	[illegible]	Quiet.
Saturday	[illegible]	[illegible]	[illegible]	Firmer.
Monday	[illegible]	38s6d	38s9d	Steff.
Tuesday	[illegible]	[illegible]	[illegible]	Firm.

Eastern Grain Markets.

The following shows the closing prices of wheat in New York for the past week:

Day.	Aug.	Sept.	Oct.	Nov.	Dec.	May.
Thursday	107½	107½	108¾	109¾	110¾	.
Friday	108¾	108¾	109¾	110¾	111¾	.
Saturday	110	110½	111¼	112¼	114⅝	.
Monday	109	111	109	111⅝	107⅝	.
Tuesday	109	109½	....	....	111¾	.

The closing prices for wheat have been as follows at Chicago for the past week:

Day.	Aug.	Sept	Dec.	May.
Thursday	103½	103⅝	107⅞	111⅞
Friday	104¼	105	108⅜	112⅝
Saturday	106½	106⅝	109⅝	103⅝
Monday	104⅞	104⅝	107⅜	111⅛
Tuesday	107	107⅛	108⅝	112⅝

NEW YORK, Aug. 27.—Wheat—$1.10⅞ for cash; $1.08⅞ for September, $1.11⅞ for December and $1.15⅜ for May.

CHICAGO, Aug. 27.—Wheat—$1.06¾ for August, $1.06⅞ for September, $1.08⅝ for December, and $1.12½ for May.

Foreign Grain Review.

LONDON, Aug. 26.—The *Mark Lane Express*, in its review of the British grain trade for the past week, says: New English wheat is in demand; red is quoted at 37s. and white at 40s. Foreign wheat and flour were quiet until the end of the week, when they became strong. Good reports from Germany, Hungary, Roumania and Russia checked a rise. At to-day's market new English wheat sold at 42s.; foreign advanced 6d. American corn advanced 3d.

Crop Items.

PESTH, Aug. 22.—Statistics gathered by the Hungarian Minister of Agriculture place the wheat harvest of the world at 775,000,000 hectoliters, and the quantity required by importing countries at 123,000,000 hectoliters. The total quantity available to meet the import demands is estimated at 148,000,000 hectoliters. The Minister of Agriculture lays stress upon the fact that owing to the small quantity of stored grain, the surplus is small as compared with the import requirements.

MONTREAL, Aug. 22.—A cipher dispatch received to-day from Manitoba by a leading broker stated that frost ranging from two to five degrees had prevailed over the whole province of Manitoba and the Territories, and that about 75 per cent of the crop had been injured more or less severely. The general opinion here is that the estimates of the extent of damage must be purely conjectural as yet.

TORONTO (Ont.), Aug. 22.—The Agricultural Department has issued a bulletin dealing with the crops. The area of the fall wheat crop is 102,000 acres less than that of last year, and the area of the barley crop is 174,000 less. The spring wheat area is greater by 203,000 acres, and the yield of wheat exceeds that of last year by 57,000 bushels. The fall wheat throughout Western Ontario is of good quality, and the crop of spring wheat will probably be better than fair.

Wool.

NEW YORK, Aug. 24. — No sales of California wools were recorded this week. The market is looking strong, and wholesalers declare that they fear to sell lest they will not be able to duplicate stock at the same figures in the West. Pacific coast keeps selling well, common at from 17c to 19c and medium at 25c, while 1888 stock sold this week for 12 to 16c.

NEW YORK, Aug. 26.—The Eastern wool markets are quiet for the date. Tight money and the indefinite position of woolen goods exclude some buyers and cause hesitation on the part of others. Prices, however, do not waver, and the interior firmness has held out longer than was anticipated. The movement in fine washed wool is remarkably light for the period. In Boston there is a good business for Territory, Texas and California wools. Of the latter, 250,000 pounds were sold at 16@24c.

Peach Failure.

NORWICH (Conn.) Aug. 25.—Forty years ago Connecticut peach orchards were the finest in the world. The fruit was as fair as that of California. So immense was the yearly crop that the market was surfeited and farmers turned their hogs into the orchards. Then came "the yellows," an inexplicable disease that killed every tree in the State. After that, few peaches grew in Connecticut until a dozen years ago fruit-growers began to set out new orchards and learned to deal with the disease. They couldn't cure it, and at the end of three years it invariably kills an orchard. But they set out new trees each year, and in the second and third years, before "the yellows" attacked the orchards, the growers had two big crops, then they let the trees perish. In this way the prestige of Connecticut peaches was revived. But this year more ill fortune has befallen peach men. The trees didn't bear at all, and the crop is a total failure. A big fruit-grower at New London said a day or two ago that the crop in Connecticut will be less than 200 baskets. As there is no Southern crop, the outlook is dismal enough for preservers.

	l.	....	....	145	155	....

BAGS—Grain bags are weak at 7½c for standard sized. The demand is slow.

BARLEY—The sample market has been fairly active at full prices. In futures, trading has been free at gradually strengthening prices. The following are the reported sales made on to-day's Call:

Morning Session: Buyer 1890—500 tons, $1.36. Buyer season — 300 tons, $1.42½; 200, $1.42¾; 200, $1.42½ ₩ ctl. Afternoon Session: Buyer 1890—500 tons $1.36⅝; 300, $1.36. Buyer season —500 tons, $1.42¾; No. 1 Brewing, buyer season —100 tons, $1.44½ ₩ ctl.

BUTTER — Receipts are large. The demand is free at a slight decline. The impression prevails that prices will not shade off much, if any more for the present.

CHEESE—The demand is fairly active, but free receipts are against any present improvement.

EGGS—The market has made another upward move. At the higher quotations buying is slow. It is claimed that receipts will begin to increase.

FLOUR—The market is strong but no higher. The export movement is free.

WHEAT — The market is very strong at full prices under a fair demand and a strong holding. In futures, trading continues quite active; the fluctuations are small in this market, but quite wide abroad. The following are to-day's Call Board sales:

Morning Session: Seller 1890, new, season storage paid—100 tons, $1.41½. Buyer 1890—1000 tons, $1.45⅞; 100, $1.45⅝; 2800, $1.45¾. Buyer season —200 tons, $1.54⅞ ₩ ctl. Afternoon Session: Buyer 1890—700 tons, $1.45¾. Buyer season—700 tons, $1.54¾ ₩ ctl.

[COMMUNICATED.]

Market Information.

Produce Receipts.

Receipts of produce at this port for the week ending Aug. 26th, were as follows:

Flour, qr. sks	59 050	Buckwheat, sks	156
Wheat, ctls	206,500	Middlings, sks	3,327

Cereals.

The local wheat market has ruled strong throughout the past week under review, and this, too, in the face of high charters for spot and near-by vessels. The strength of the market is in sympathy with higher prices at the East and also abroad. The cheapening of money in England has considerable influence on market values, although to the advance in the price of silver it is more largely due. The tonnage on the way is increasing, but that due within the next 30 days only aggregates about 40,000 tons register, but within the following or succeeding 30 days the registered tonnage that is due aggregates fully 80,000 tons. As each ton registered is equal to a carrying capacity of 1 6-10 short (2000 lbs) tons, the quantity of wheat that can be safely handled is easily figured out. It now looks as if we may possibly have a surplus tonnage, for the high cost of coal in this city will attract liberal shipments from Australia. The wheat tonnage (registered tons) on the way up north compares as follows with the like time in 1889:

For	1890.	1889.
Oregon	44,414	35,386
Puget Sound	32,310	11,334
British Columbia	19 584	8,661
Totals	97,308	55,381

The above shows a gratifying increase for the present season.

Threshing in this State will soon be through with. The returns from the threshers are very mixed, making it quite difficult to arrive at a satisfactory estimate; yet judging from last year's outturn we still adhere to the opinion that it will be about 1,050,000 against 1,450,000 last year. Taking it as a whole, the grade is better in 1890 than it was in 1889. Oregon and Washington advices are confirmatory of a large outturn. The average to the acre runs from 15 to 20 ctls, fully 40 per cent more than in last year. The quality is excellent.

Barley has held to strong prices through the week. The absolute certainty of a shortage in the crop is the prime support to the market. The demand from feeders and maltsters is good, but from shippers it is slow owing to the prices here being above European and Eastern parity. The grade this year is said to be above last year's, both in weight and color. Eastern Oregon and Eastern Washington advices report an increased yield this year.

Oats have held firm but steady. The demand is good. The yield in this State is light. It is stated that the crop in Oregon is only an average.

Corn is strong at unchanged quotations. The light yield at the East is in favor of holders.

Rye is steady. Buckwheat is slow.

Feedstuff.

Bran and middlings are in good request at higher prices than have ruled for two years past. Ground barley is strong at a slight advance. Feed-meal is steady.

Choice grades of hay are strong at another advance. The consumption is quite large, being larger than ever before known. Fair to good grades are stronger, but poor is slow. The yield this year is not as large as it was estimated early in the season.

Fruits.

In berries, raspberries are scarce and high. Strawberries and blackberries are in fair receipt. Prices are unchanged, but, if anything, a little firmer. Huckleberries are lower under freer receipts.

In tree fruits both pears and peaches are firmer, with quite an advance in the latter. Canners are buying. Plums are unchanged, receipts being quite heavy. Nectarines are firmer. Apples are meeting with a better inquiry; chiefly for the more choice, better keepers for shipping.

Grapes are a shade weaker under free receipts, with local buyers offish. In wine grapes there is nothing new to report.

The dried-fruit market continues firm notwithstanding a weaker feeling at the East. Strength here is due to light available supplies, Eastern buyers having contracted for about all to be had, which compels large jobbers on this coast to bid well up so as to have their wants met. A carload of prunes was shipped from Los Gatos on yesterday (Tuesday) to the East and another was sent out from Santa Rosa. Apples appear to be in better demand. Quotations in sacks are as follows: Evaporated apples (boxes), 12@13c per lb; sliced, 8@9c; quartered, 7½@8c; pitted plums, 9@9½c per lb; evaporated peaches, 18@21½c; bleached apricots, sacks, 14@17c per lb; boxes, 17@18c per lb; White nectarines, 15@17c; Red nectarines, 11@12c; California prunes, ungraded, 8½@10½c.

Dried grapes are not quite so active, owing to buyers having dropped their bids to 3¾c for the better grapes against 4c a week ago. Some think the decline temporary and brought about by a weekly contemporary's insidious attack against the prices which obtained at that time.

There is a good demand for lower grades of raisins. The buying, it is said, is due to the higher cost of dried fruits. For other raisins the market is quiet but strong. For raisins in the sweat, quotat ons are given at from 4½ to 6 cts, according to grade, etc. For September-October delivery, Layers are quoted at $1.75 to $2.25 and loose Muscatels $1.50 to $2.

Vegetables.

The onion market continues to show strength under moderate receipts and a good demand. Shipments the past week to Australia and New Zealand aggregated nearly 2000 crates. It now looks as if the crop was short of expectations.

Potatoes are stronger, notwithstanding freer receipts. The inquiry is chiefly for the better keepers. The call is both local and for shipping.

In garden truck there is nothing new to report, outside of lower prices for tomatoes. At the decline, canners are in the market.

Live-stock.

The market is without essential change. Offerings continue free. The high price of feedstuff is against cattlemen not having desirable range for their stock. It is generally claimed that when the new stock-yards get under way the market may improve. Cows are reported unchanged; the demand is said to be quiet owing to the high price of feed and the low price of butter. Hogs are weaker.

The market for dressed cattle is quoted as follows [to obtain the price on foot, take off from the price for stall-fed one-third to one-half, according to the nature of the feed and time fed; and for grass-fed take off the price from 40 to 60 per cent]:

HOGS—On foot, light grain fed, 4¼@4⅝c ₩ lb; dressed, 7¼@8½c ₩ lb.; heavy, 3⅝@4c ₩ lb.; dressed. 5¾@6¾c ₩ lb. Stock hogs, 4¼@4½c ₩ lb

BEEF—Stall fed, 6½@—c ₩ lb.; grass fed, extra, 6@—c ₩ lb.; first quality, 5¼@5½c ₩ lb.; second quality 4¾@5c ₩ lb.; third quality, 4c@— ₩ lb.; bulls and thin cows, 2@3c ₩ lb.

VEAL—Small, 6@8c ₩ lb.; large, 4@6c.

MUTTON—Wethers, 6½@7c ₩ lb.; ewes, 6@6½c ₩ lb.; lamb, spring, 7@8c.

Miscellaneous.

Poultry has arrived quite freely, causing a weaker market.

Hops have been booming, until at the close 30c is named. In this State and Oregon 25c was freely paid, then 27½c, and now 30c is named as the price, but we are not informed of sales being made at over 27½c. The Eugene, Oregon, *Register* of Aug. 22 says: From one of the most prominent hop growers in Lane county we learn that there will not be over half the usual number of bales of hops gathered this year. During the past few years several yards have been grubbed out and others have been allowed to wear out instead of being replaced, and but very few new yards have been started. Besides the decrease in acreage, the yards in many parts of the country are not bearing as heavy as usual, and for this reason he feels justified in saying that there will not be more than half the usual number of bales. He expects his yard to fall short 13,000 pounds.

Wool is reported unchanged. The tone is far from reassuring, being weak, owing to close money markets at the East and heavy stocks of woolen goods.

Beans are coming in fairly free. The market is very strong for new to arrive. The unfavorable crop weather at the East is in our favor.

Honey is coming in quite freely, but the market is kept fairly well cleaned up at a slight reduction on quotations.

New crop nuts are meeting with a good inquiry, with buyers bidding an advance for October delivery.

Hog products are strong, with perhaps a slight advance obtainable.

Exports by sea the past week aggregate as follows: Wheat ctls, Liverpool, 91,703; Cork, 60,669; Rio de Janeiro; 41,216. Flour bbls, China, 17,266; Japan, 1120; Manilla, 250; Australia, 232. Barley ctls, Liverpool, 10,169. Brandy gals, Liverpool, 4479. Canned fruits cases, Liverpool, 8027; Glasgow, 1050; Australia, 280. Cotton lbs, Liverpool, 99,113. Oats ctls, Mexico, 1607. Butter lbs, New Zealand, 1000. Apples boxes, Australia, 2076; New Zealand, 325. Beans lbs, China, 5378; Australia, 14,437; Hops lbs, Australia, 3000. Broomcorn lbs, Australia, 31,172. Honey cases, Liverpool, 326; Australia, 45. Hay bales, Mexico, 139; Honolulu, 600. Wine gals, Mexico, 2852. Corn ctls, Australia, 2000. Onions, crates, Australia, 1648; New Zealand, 120.

From the *Commercial News* of Aug. 27th the following summary of tonnage movement is compiled:

	1890.	1889.
On the way to this port	295,268	219,426
On the way to neighboring ports	23,841	21,329
In port, disengaged	3 751	28,655
In port, engaged for wheat	42,247	67,340
Totals	365,107	336,750

To get the carrying capacity, add 65 per cent to the registered tons as given above.

From July 1, 1890, to Aug. 20, 1890, the following are the exports from this port:

	1890.	1889.
Wheat, ctls	1,497.210	1,539,837
Flour, bbls	138,461	159,894
Barley	39,959	138,951

Domestic Produce.

Extra choice in good packages fetch an advance on top quotations, while very poor grades sell less than the lower quotations. WEDNESDAY, Aug. 27, 1890.

California Fruits East.

CHICAGO, Aug. 21.—The Earl Fruit Co. to-day sold California fruits as follows: Bartlett pears, overripe, $2 60@2.70; Tokay grapes, $2.40@2.75 per half-crate; Muscat grapes, $1.45@1 65 per half-crate; peaches, $1 75@2.20.

The Porter Bros. Co. sold six carloads. Early Crawford peaches brought $1.60@1.90; Susquehanna peaches, $1.80@1.90; Muscat grapes, $1.60 @1.75 per half-crate; Bartlett pears, $3.25@3.55, with the exception of some overripe stock, which sold at $1.40@2.10; Tokay grapes, $2.50@2.60 per half-crate; Japan plums, $1.25; Gros prunes, $1.40; Hungarian prunes, $1.55@1.40; Orange Cling peaches, $1.90; White Cling peaches, $1.75; Beurre Hardy pears, $2 40@2.50; Beurre Clairgeau pears, $2.25; Black Hamburg grapes, $1.35 per half-crate; Rose de Peru grapes, $1@1.25 per half-crate.

NEW YORK, Aug. 21.—Sgobel & Day, agents of the California Fruit Union, report that the market on Bartlett pears is improving daily. Peaches are in demand, but they must be prime and of full size. The weather is favorable.

The contents of three refrigerator cars were sold to-day at the following prices: Bartlett pears, $3.80@3.05; Gros prunes, $1.90@1.60; Washington plums, $1 65@1.30; Yellow Egg plums, $1.75@1.60.

CHICAGO, Aug. 22.—Porter Bros. sold ten carloads of California fruit to-day as follows: Peaches —Orange Cling, $1.50@2; Early Crawford, $1.75@ 2.05; Susquehanna, $1.60@2. Pears — Bartlett, $2.50@3.25, with the exception of one car of inferior stock which sold at $2.05@2.15; Beurre Hardy, $2.50; Beurre Clairgeau, $2 25. Grapes—Muscat, half-crate, $1.55@1.75; Tokay, poor to fair order, $1.75@2.60; Gros prunes, $1.50@1.70.

CHICAGO, Aug. 22.—The Earl Fruit Co. sold California fruit to-day as follows: Bartlett pears, condition fair, $3.35; over-ripe, $2.55@3. Grapes—Tokay, half-crates, $2.60@2.95; Muscat, $1.60@ $1.80; Rose de Peru, not wanted, $1@1.30; peaches, $1.65@2.20.

CHICAGO, Aug. 23.—California green fruits—Prices have not changed materially. There was the usual local and order demand. The supply continues ample, quotable as follows: Nectarines, 20-lb boxes, $1@1.25; peaches, 20-lb boxes, Crawford, $2@2.25; Orange Cling, $1.5c@1.75; pears, Bartletts, green, $3@3.50; ripe, $1.50@2.50; Beurre Clairgeau, $2@2.50; Duchess, $1.75@2; Beurre Hardy, $2.50@2.75; Gros prunes, $1.50@1.75; Purple Duane plums, $1@1.75; Washington, $1@ 1.25; Egg, $1@1.25; Columbia, $1@1.25; German prunes, $1.55@2; grapes, half-cases of 4 baskets, Fontainebleau, $1.25@1.50; Muscat, $1.75@2; Tokay, $1.75@2; Rose de Peru, $1@1.25. B ans continue salable, and the market is ruling firm. Lots that have been for some time held for higher figures are being by degrees sold out. It is from this source, and not from current receipts, that buyers are obtaining supplies, for arrivals are very small. California Pea beans, $2.40@2.50 ₱ ctl.; California Lima beans, choice, 5½c ₱ lb; common, 2@4c.

CHICAGO, Aug. 23.—The Earl Fruit Co. sold four cars of California fruit to-day as follows: Bartlett pears, ripe, $2.15; table, $2.10; peaches, $1.85@ 2.10; small lot White Cling, $1.30; Gros prunes, $1.65; Beurre Hardy, $2@2.50; Washington plums, $1.70; Tokay, half-crates, a trifle moldy, $2.30@ 2.90; Muscats, $1.75@1.80; a few poor, $1.40@1.60.

CHICAGO, Aug. 23.—Porter Bros. sold eight carloads of California fruit to day as follows: Bartlett pears, all ripe, $1.85@2.95; Tokay, half-crates, $2.75 @2.90; Muscat, $1.5(@1.80; Orange Cling peaches, $1.70@2; Susquehanna, $1.80@2.05; Early Crawford, $1.75@2 05; White Cling, $1.70; Fallenberg plums, $1.95; Japan, $1.30; Rose de Peru grapes, half-crates, $1.05@1.80; whole crates, $2.60; nectarines, $1.90; Beurre Clairgeau pears, $2.15; Beurre Hardy, $2.35; Yellow Egg plums, $1.05@1.35; Gros prunes, $1.45@1.85.

NEW YORK, Aug. 25.—Sgobel & Day, agents of the California Fruit Union, report that the market continues strong on all fruit; and, even with the largely increased offerings, the fruit to-day sold rapidly. Dealers appear especially hungry for peaches.

Five carloads were sold to-day at the following prices: Early Crawford peaches, $1.50@2.10; Late Crawford peaches, $2.60; Susquehanna peaches, $1.75@2.45; Orange Cling peaches, $1.75@2.05; Tokay grapes, $2.75@3.50 per half-crate; Muscat grapes, $1.05@1.70 per half-crate; Bartlett pears, $2.25@3.80; Gros prunes, $1.60@2.20 per half-crate; German prunes, $1.75; Hungarian prunes, $1.75. Demand good.

CHICAGO, Aug. 25.—The Earl Fruit Co. to-day sold at auction four carloads of California fruits as follows: Bartlett pears, over-ripe and poorly packed, $2.10@2.50; Beurre Hardy pears, $2 30@2.45; Howell pears, $2.55; Susquehanna peaches, $1.75@ 1.90; Yellow Cling peaches, $1.65@1.90; Tokay grapes, in poor order, $2.40@2 80 per half-crate, some in bad order selling for less; Muscat grapes, in poor order, $1.3c@1.70 per half-crate.

The Porter Bros. Co. sold eight carloads. Bartlett pears, green, $3.15@3.95; Bartlett pears, ripe, $2@3; Early Crawford peaches, $1.8c@2; Susquehanna peaches, $1.90@2.10; Orange Cling peaches, $1.90@2.10; Muscat grapes, $1.55@1.80 per half-crate; Rose de Peru grapes, $1.25@1.45 per half-crate; Foster peaches, $1.75; nectarines, $2; Purple Damascus grapes, $1.75 per half-crate; German prunes, $1.75; Hungarian prunes, $1.70; Gros prunes, $1.90@2.10; Tokay grapes, $2.2c@2.90 per half-crate; Fontainebleau grapes, $1.30@1.60; Egg plums, $1.50.

NEW YORK, Aug. 25.—The *Evening World*, in the course of a long article on the fruit market, says: The only fruit that is worthy of the name now to be found in the market comes from California. The Pacific Coast supply began to come here during the latter part of July. Of course, all this fruit is of the best quality, and it is held to be worth about its weight in gold. Small boxes of Early Crawfords and oranges and Yellow Clingstones weighing about 25 pounds sell from $2 to $4. The late Crawfords will probably bring more. The fruit preservers are in a bad state of mind over the situation. There are not enough peaches in all the Eastern States to supply a single good-sized canning factory.

NEW YORK, Aug. 25.—There is nothing to add to last week's strong situation in packed and canned Pacific produce. Full support is accorded the ruling scale of prices by buyers, who accept the position of things, and sellers lose little time with reluctant purchasers. Dried nectarines sold at 25c. Fifty-seven cars of fresh fruit caused some slow trading, as the previous week's high rates checked consumption, but good prices are still obtained for Bartletts not yellow ripe. Plums arrived in a tender condition. The outlook for the fall trade is bright, as many buyers will come back to the quality and condition of the fruit.

Newspaper Agents Wanted.

Extra inducements will be offered for a few active canvassers who will give their whole attention (for a while at least) to soliciting subscriptions and advertisements for this journal and other first-class popular newspapers. Apply soon, or address this office, giving address, age, experience and reference. Special inducements to old agents.

Dewey & Co., Publishers,
No. 220 Market St., S. F.

To Remove the Smell of Paint.—The best way to remove the smell of paint is to first render the room as nearly as possible air-tight by closing the windows, doors and other openings. Place a vessel of lighted charcoal in the room, and throw on it two or three handfuls of juniper berries. After 24 hours the smell will have entirely disappeared. Another method of doing the same thing is to plunge a handful of new hay into a pail of water and let it stand in the newly painted room.

Complimentary Samples.

Persons receiving this paper marked are requested to examine its contents, terms of subscription, and give it their own patronage, and as far as practicable aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription, paid in advance, 5 mos, $1; 10 mos., $2; 15 mos., $3. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber, please show the paper to others.

The First Mechanical Invention.—On Thursday, July 31st, occurred the one-hundredth anniversary of the issue by the United States Government of a patent for a mechanical invention. The patentee was Samuel Hopkins, for a process for making pot and pearl ashes. The number of patents issued during the first century of the nation's existence was 433,432, and still they multiply.

For Sale.—Valuable land in Tulare county artesian belt. 160 acres, 1½ miles southwest of Tulare city; 480 acres, 7 miles southwest of Tulare, with large flowing artesian well, well-finished two-story horse, large barn, etc.; 160 acres, 2 miles southwest of the above; 480 acres 3 miles southwest of Pixley and about 4 from Alila. For sale by owner in lots to suit at low prices, low interest and very easy terms. For further information, address LAND OWNER, Box 2517, S. F., or A. T. DEWEY, No. 220 Market street, San Francisco, Cal.

Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, *we request the same to be entended to pay for it*, we hope not fail to write us *direct* to stop it. A postal card costing one cent only will suffice. We will not knowingly send the paper to any one who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent. Look carefully at the label on your paper.

Gilt Picture Frames may be brightened by taking sufficient flour of sulphur to give a golden tinge to about one and one-half pints of water, and in this boil four or five bruised onions, or garlic, which will answer the same purpose. Strain off this liquid, and with it, when cold, wash with a soft brush any gilding which requires renewing, and when dry it will come out as bright as new.

WORTH'S
PATENT
Combined Screw and Toggle Lever
WINE, CIDER
—AND—
OLIVE PRESS

The press is satisfactory in every way and every one who has seen it work thinks it ahead of any press yet in use.—KATE F. WARFIELD, Glen Ellen, Sonoma county.

It works most admirably.—J. H. DRUMMOND, Glen Ellen.

The vintage is over; have used your press, to press about 800 tons of grapes, with entire satisfaction. It works well and is easy to operate.—L. DE TURK, Santa Rosa.

The wine press was used during the vintage and gives satisfaction.—GEO. WEST, El Vino Vineyard, Stockton.

The wine press has accomplished all you claimed for it and, in fact, more.—R. J. NORTHAM, President Golden Belt Wine Co., Anaheim.

I find it so entirely satisfactory that I take pleasure in commending it to the public.—ELI T. SHEPPARD, Glen Ellen.

A child can move it from one end of the winery to the other. Has given me perfect satisfaction.—J. B. J. PORTAL, San Jose, Cal.

Although I have at present only ten acres of vines, would not part with the press at any price.—WILLIAM PFEFFER, Gubserville, Cal.

Is the quickest, most powerful and easiest to handle of any wine press I ever saw, and undoubtedly the best press in the market.—JOSEPH WALKER, Windsor, Cal.

We regard the wine press as superior to any other press we know of; in point of simplicity, efficiency and economy of labor, in our opinion it has no equal.—P. & J. J. GOBBI, Healdsburg.

I am very well satisfied with the toggle lever and screw wine press. It has worked well during the season.—WM. ALLEN, Mountain View Wine Co., San Gabriel, Los Angeles Co., Cal.

The Wine Press gives satisfaction; it works well and is easy to operate.—W. METZGER, Santa Rosa.

Have much pleasure in stating that the press has given every satisfaction.—J. LAWRENCE WATSON, Glen Ellen, Sonoma county.

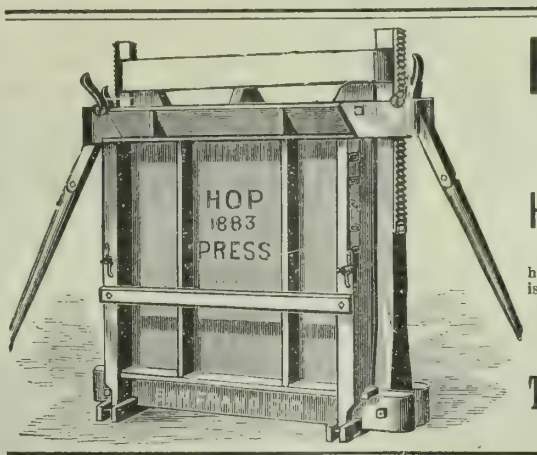
THE PELTON WATER MOTOR

Affords the cheapest and most convenient power for Ranch, Vineyard or Dairy purposes, as well as for running dynamos for electric lights, pumps and every other variety of machinery

It possesses in the same degree the wonderful energy and power that has made the Pelton Wheel famous in all parts of the world.

These motors are made of varying sizes, with capacities ranging from the fraction of one up to 15 and 20 H. P., enclosed in iron cases, all ready for pipe connections, and are warranted to develop a given amount of power with one-half the water required by any other wheel.



The cost, considering capacity and efficiency, is fully 50 per cent less.

Circular, giving full information, sent on application.

Parties writing for information should give full particulars as to power wanted, source of water, supply, with head or pressure. Address

THE PELTON WATER WHEEL CO.,

PULSOMETER STEAM PUMP.

Capacity 600 to 120,000 Gallons per Hour.

Water, if containing 60% of Mud or Sand, can be pumped from wells or streams with **one-fourth less fuel than any other known method.** No machinery to wear out or require constant attention.

SENT ON TRIAL to responsible parties. See what the users have to say about it. Address

1890—THE STATE FAIR—1890

OF 1890 AT

SACRAMENTO,

SEPTEMBER 8th TO 20th INCLUSIVE.

CALIFORNIA'S ANNUAL EVENT!

Showing Progress Made in Agricultural, Mechanical and Industrial Arts.

Cal State Library JL '96

LIBERATI'S FAMOUS MILITARY BAND OF FIFTY SELECT ARTISTS AND DISTINGUISHED VOCALISTS

Will give a Grand Musical Concert at the Pavillion each evening from September 15th to 20th.

THE COUNTY EXHIBITS made at these exhibitions have attracted more attention to localities represented than any other form of advertising advanced.

EVERY COUNTY IN THIS STATE should have an exhibit. Begin with harvest and secure samples of your products. The money premiums will almost pay the entire cost of your exhibit.

NEW-COMERS ARE AWAITING to view the products of the State before locating. Hence it behooves every county to be up and stirring.

IT IS AT THESE EXHIBITIONS the Manufacturer meets the Merchants of the interior.

IT IS AT THESE EXHIBITIONS the Merchant views progression made in all mechanical and industrial callings. Hence it behooves the Manufacturer to be up and stirring.

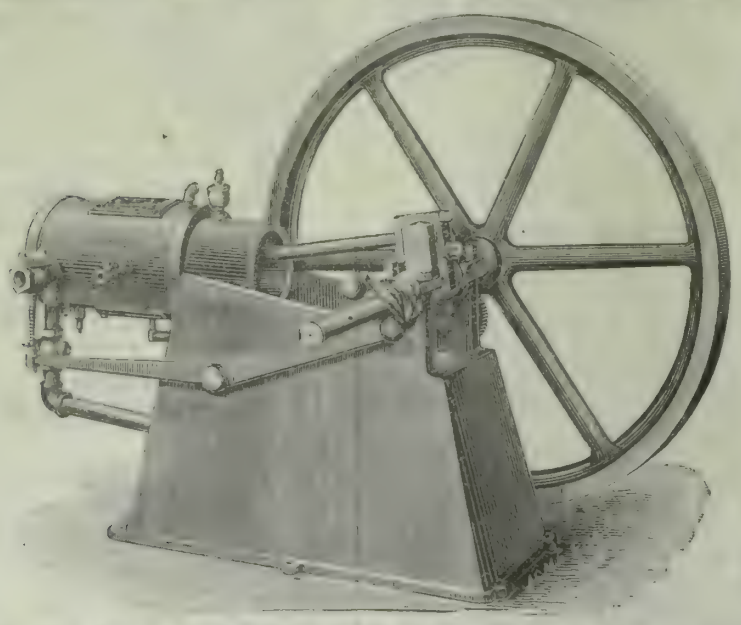
AT THESE ANNUAL EXHIBITIONS the visitor may combine business with pleasure, as the Board of Directors provides for all kinds of recreative amusement in the varied program of events.

THE CONTESTS OF SPEED showing advancement made in the breeding of high-class horses, will be a feature.

THE GRAND PARADES OF LIVE-STOCK will embrace the various classes of horses, and all the improved breeds of cattle.

OPEN-AIR AMUSEMENTS FOR THE DAY and MUSICAL CONCERTS FOR THE EVENING will afford ample entertainment for all who visit the State Fair.

Every attention will be rendered exhibitors by the Board of Directors.



Premium lists are now ready, and will be furnished upon application to the Secretary, who will also furnish other necessary information that may be desired. Apply at once for space.

Remember, the Southern Pacific Company TRANSPORTS ALL EXHIBITS FREE OF CHARGE to and from the Fair, and gives EXCURSION RATES TO ALL THAT ATTEND.

CHRISTOPHER GREEN, President.

EDWIN F. SMITH, Secretary.

REGAN VAPOR ENGINE.

NO BOILER, FIRE, EXPLOSION, STEAM, ASHES OR ENGINEER.

STARTED INSTANTLY WITHOUT EVEN A MATCH.

The Moment Engine Ceases to Run, all Expense Stops.

Upright and Horizontal, Stationary and Marine Engines from ¾ to 60 Horse Power.

OUR STATIONARY ENGINES are especially adapted for PUMPING and IRRIGATING.

OVER 150 IN USE.

POPE & TALBOT, Lumber, Office, 201 California Street. P. O. Box 2215. San Francisco, Feb. 25th, 1890.

REGAN VAPOR ENGINE CO., Gentlemen: The 3-H. P. Vapor Engine I bought of you last May has been in constant use ever since, and has given entire satisfaction. I have found the engine to be all that you claimed for it, and more too. You can use my name for reference if you so desire. I am, yours truly, H. TALBOT.

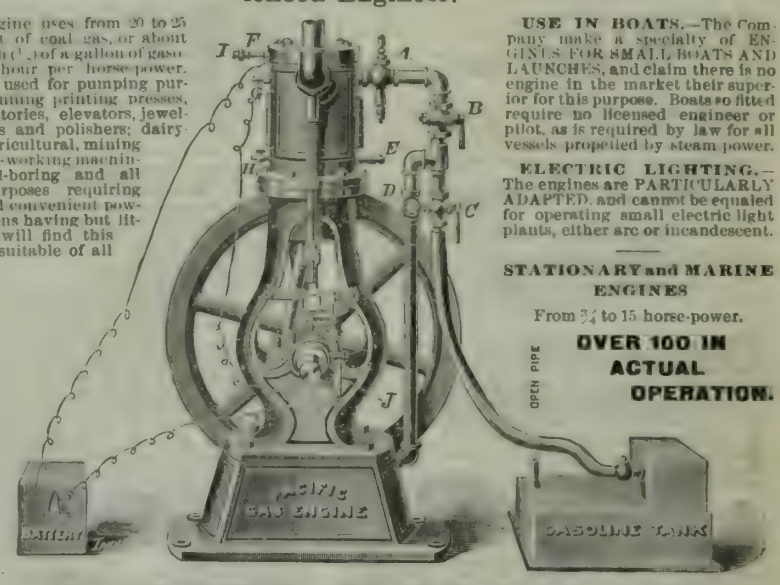
We carry a full line of Thos. Kane & Co's Famous Racine Launches, fitted with our New Compound Engines. SEND FOR CIRCULAR.

REGAN VAPOR ENGINE CO.,

221-223 First Street, San Francisco, Cal.

THOS. KANE & CO., 137-139 Wabash Avenue, Chicago, Ill.

THE



PACIFIC GAS OR GASOLINE ENGINE.

PATENTED JUNE 17, 1890 — NOS. 430,504, 430,505, 430,506.

Also in Great Britain and other foreign countries.

Starts Instantly Without the Necessity of Boiler, Fire or Experienced Engineer.

The engine uses from 20 to 25 cubic feet of coal gas, or about one-eighth (⅛) of a gallon of gasoline per hour per horse-power. It can be used for pumping purposes, running printing presses, small factories, elevators, jewelers' lathes and polishers; dairymen's, agricultural, mining and wood-working machinery; well-boring and all other purposes requiring cheap and convenient power. Persons having but little space will find this the most suitable of all motors.

USE IN BOATS.—The Company make a specialty of ENGINES FOR SMALL BOATS AND LAUNCHES, and claim there is no engine in the market their superior for this purpose. Boats so fitted require no licensed engineer or pilot, as is required by law for all vessels propelled by steam power.

ELECTRIC LIGHTING.—The engines are PARTICULARLY ADAPTED, and cannot be equaled for operating small electric light plants, either arc or incandescent.

STATIONARY and MARINE ENGINES

From ¾ to 15 horse-power.

OVER 100 IN ACTUAL OPERATION.

OPEN PIPE

READ THESE TESTIMONIALS.

ALAMEDA, April 8, 1890.

PACIFIC GAS ENGINE CO., GENTLEMEN: Permit me to add my testimonial to the many you have received indorsing your engine. As you are aware, in me was a Regan engine which gave me considerable trouble. I had to remove the head and raise the tappet valve every time I wanted to start the engine. I sent you the engine; you removed all the Regan appliance except the cylinder and stand. You put in your appliances, head, sparking device, inlet valve, and, in fact, changed it to the Pacific Gas Engine, which now works splendidly. I have not had to remove the head for any cause since you made the change (over two months). It gives me no trouble; my boy, 14 years old, attends to it.

The change from the Regan to the Pacific is a decided improvement. I can also get a third more power since the change, and I cheerfully recommend your engine as being simple, effective, and cheap. Respectfully yours,

B. S. HILL, S. W. Cor. Encinal Ave. and Morton St.

MAYFIELD, March 26, 1890.

PACIFIC GAS ENGINE CO.—We have given your little 1-H. P. engine a splendid advertisement. A fire broke out at 2:30 o'clock this morning, in a tenement house on my premises. I started the engine, connected the hose, and by it have saved at least $3000 worth of my property. I saved my blacksmith shop, lying 12 feet from the burning building, my barn and my dwelling. Three times the fire started in these buildings, and I extinguished it every time. The engine never faltered, and threw water between 50 and 60 feet high. The whole town was astonished, and they acknowledged that I saved at least $20,000 worth of property.

A fire department is being organized here, and I think they will have one of the engines on a truck for fire purposes. The engine to be beaten.

Hoping that all of your customers will be as well pleased with the engine as I am, I remain, Yours truly,

JOS. P. PONCE.

GROUP OF THOROUGHBRED SHORTHORNS, OWNED BY A. HEILBRON & BRO., SACRAMENTO, CAL.

Fine Shorthorns.

We give herewith a drawing representing a group of the fine Shorthorn cattle of A. Heilbron & Bro. of Sacramento, who own the Wild Flower Stock Farm, six miles southwest of Selma, in Fresno county. Messrs. Heilbron have given much attention during recent years to building up a fine band of Shorthorn cattle, both by purchase and by their own breeding. As a result of this effort and investment, they have secured excellent representatives of some of the families most famous in Shorthorn history, and thus have placed them upon the surest foundation for the upbuilding of their enterprise and for securing results most satisfactory to the breeder and valuable to the State. The names and notes of breeding attached to the engraving afford intimation of the honorable ancestry of the stock. To any one who has given any attention to Shorthorn history, the statement that the Wild Flower herd is rich in the blood of the Young Mary, Rose of Sharon, Josephine and Young Phillis tribes carries much weight, and to those unacquainted with the subject, the perusal of Messrs. Heilbron's catalogue, which gives excellent outlines of the records of these tribes, contains the most available information.

PRUNES.—The State Horticultural Society had an interesting discussion on this subject at its last meeting, which we will report in our next issue.

Dairy Organization.

The Santa Maria dairymen have perfected their organization by the adoption of by-laws which provide a name for the organization, "The Dairymen's Protective Union," and stipulate the sum of $2 as being the regular initiation fee for those wishing to join the union. The dues are rated according to the number of cows milked by each member; thus the small dairyman is asked only for his pro rata, the rate being fixed at a figure sufficient to cover running expenses of the union.

The *Graphic* gives the following note on the condition and aims of the organization: "The union is now on a good footing, with good substantial backing, and there is no reason why it should not accomplish much good for its members. The object, as stated before, is to devise ways and means by which the dairymen can secure the full market price for their produce. It appears that for years past there has been a 'systematic steal' by the commission men, and this is what the union proposes to remedy."

SEVERAL meetings have been held in Pasadena in order to provide for the formation of an irrigation district.

TEN ships have been chartered to load wheat for Europe in September, says the Port Townsend *Call*.

THE Directors of the Mechanics' Institute will attend the State Fair next week in a body.

THE APIARY.

Questions Answered.

EDITORS PRESS:—Below I give answers to a number of questions that have been asked me from time to time by various bee-keepers of the Pacific Coast and elsewhere.

Foul Brood.

Tell us something about foul brood; how to detect it, etc. Suppose a person bought honey extracted from foul broody colonies and fed it to his bees, would they be liable to take the disease? Should not a law be enacted to compel negligent apiarists whose bees have foul brood to make them destroy or get rid of the disease?—H. K. H., *Lang, L. A. Co., Cal.*

Foul brood has several different symptoms and is detected in a great many ways. The chief symptom is a decline in the prosperity of the colony, and if the brood is examined it seems to be putrefied and emits a pungent smell or stench. By taking careful notice you will see that the cappings over the diseased cells are sunken and that a small hole is perforated through the center of the capping. There are several different phases of the disease foul brood, and sometimes there are no holes perforated through the cappings and no stench is emitted. Chilled brood is sometimes mistaken for foul brood, and it is quite easy to make the mistake. Chilled brood will never cause foul brood, and if the bees have any chilled brood on hand they will soon tear it out, whereas in foul brood they seldom do this.

Yes, extracted honey taken from foul broody colonies and fed to other bees will help scatter the disease wonderfully—never do such a thing. If you buy extracted honey to feed your bees with, scald it every time.

Yes, I think a law should be enacted to compel negligent apiarists, whose bees have foul brood, to destroy or cure the disease. In Colorado, I believe such a law is in force; also in Ventura county, California, they have a foul brood inspector.

Cost of Starting in the Bee Business.

I have been much interested in your communication in the RURAL PRESS, and being desirous of more information in regard to bee culture, I write to ask you if you know of some reliable book on the subject which you can recommend to me? Would you kindly inform me what would be the cost of 25 or 30 hives, including all necessary appliances for handling the honey?—E. E. S., *Santa Rosa.*

"Root's A B C of Bee Culture," and T. G. Newman's book entitled, "Bees and Honey," are both very good books for beginners, and are fully up to the times. You can get Langstroth hives complete for $1.50 in this State. I would advise you to get the regular Langstroth and use nothing but that style. When you use two or more different styles of frames in your apiary it causes perplexities and troubles innumerable.

In regard to the appliances for handling the honey, if working for extracted honey, it would cost you maybe $4 or $5 for cans. You can get a good honey extractor for $10. If working for comb honey you would need 2500 sections, which would cost you about $12 50 delivered at your station. For 30 hives, you could use to advantage about $10 worth of comb foundation, which, in a good honey season, would pay you well. You will need a good bee-smoker, and I advise you to get one of Binghams & Hetherington's make.

Solar Wax Extractors.

What is the cost of a solar wax extractor, and how are they constructed? I have the combs from about 70 hives that failed to get through last season. The moths are after the combs now; what had I better do?—I. R., *Salinas City.*

If I were you, and wanted to continue in the bee business, I would try and buy enough bees to protect those combs; it would pay you well in the long run. You can get a good steam wax extractor for $2.50, and you can make a good solar wax extractor for about the same price. Solar wax extractors are quite simple and easy to make. Make a box of about six inches deep, of any size that suits you; nail together tightly and cover the bottom with wire screen of about five meshes to the inch; now fit a sheet of glass in a frame so as to fit the top of the box; after that is finished make another box of the same size and nail a good, tight bottom in it; now, after placing a pan (or what is better still, have the lower box lined with tin so it will not leak), you are all ready for business. Fill it up with the scraps of comb that you have on hand and locate it in a convenient spot in the apiary, and in a few hours, if the day is warm, you can refill with more scraps of comb.

With a solar wax extractor, the wax rendered is of a finer quality than that rendered by artificial heat. With the number of combs that you have on hand, you will, no doubt, get a great deal of fine wax, and if you use a solar wax extractor, you will get considerable more.

A New Beehive.

I take the liberty to write to you in regard to beehives. I do not profess to have much experience in bee-keeping. I live in Penn valley, Nevada Co., and our altitude is about the same as yours. I have about 20 stands of bees. I have been industriously engaged, for over two years, to produce a beehive that would beat the moth. I think I now have the very best hive, not only that there is in existence, but the best that can be. Now I will, if you please, offer to make you a proposition. With your consent, I propose to send you for your examination one of my beehives. I will pay all charges, etc. I will be anxious to obtain your advice regarding shape, dimensions, of beehive, etc., after you have seen mine.—J. A. B., *Grass Valley.*

Of course I wrote to Mr. J. A. B. and told him it was a waste of time to attempt to make a hive that would beat the moths, and also told him that there were very few patent hives that ever paid for the patent. A few days ago Mr. John A. Ball made me a visit and brought his patent hive along.

"Now, Mr. Watkins," said he, "let me enumerate the merits the hive contains before you give any opinion."

Well, to make a long story short, the hive has some very good merits, the principal one being in moving bees; the whole thing is clamped together in such a way that it would be impossible for the frames to move. Still, I think that there is room for considerable improvements. Next spring I will try the hive and inform the bee-keeping world what desirable merits the hive contains.

El Dorado County for Health and Honey.

I noticed in the *American Bee Journal* of June 28th an article copied from the PACIFIC RURAL PRESS, entitled "Honey Plants of the Sierras," written by yourself. The article interested me very much—not so largely on its honey-producing qualities as what you say of the climate; and of course where there is an abundance of flowers there will be a mild climate. My health has been poor for some years, and I have been for some time looking for a climate that will suit my condition. I wish you would give me a detailed account of the principal industries of your county. How far are you from Sacramento, and what railroad have you, if any?—L. M., *Auburn, Ill.*

We have as good a climate here as in any section of California. Apples, peaches, pears, grapes, cherries, figs, plums and all varieties of small fruits grow to perfection. The eastern part of El Dorado county is heavily timbered with dense forests of sugar pine, fir, spruce and several different varieties of oak. We have a railroad to Placerville. It is 69 miles from Placerville to Sacramento. The principal industries of El Dorado county are fruit-raising, mining and the lumber business, this latter being carried on the most extensively. I suppose that there are about fifteen sawmills in active operation in the eastern part of El Dorado county. For further particulars I would refer you to the county papers, the two principal ones being the *El Dorado County Republican*, published by G. A. Richardson, Placerville, and the *Mountain Democrat*, published by the Democrat Publishing Company, Placerville. By getting a sample copy of those papers they will give you more definite information than I can give of the various resources of El Dorado county. S. L. WATKINS.

Grizzly Flats Cal.

ENTOMOLOGICAL

Popularity of the Fumigation Method of Killing Scales.

Hiram Hamilton reports the following as a part of the proceedings of the Orange County Board of Horticulture at its meeting July 30th:

Mr. Preble of the Tustin district reported that the work of red-scale killing was going bravely on; that no compulsion was necessary to get men to work; that every rig for fumigation was in demand; that orchardists were each anxious to secure their turns; that a large number of groves had been completed; that the results of the work were not entirely uniform, owing, in part, to inferior cyanide used. A uniform grade of this article is necessary to secure the best results. The Commission has opened correspondence with every known manufacturing establishment in the United States to ascertain the percentage of cyanogen indicated by each brand.

Mr. Hamilton reported the same condition of things in his district. No compulsion has yet been found necessary. Each grower is anxious only to learn the surest and most economical method of destroying the scale.

Mr. Keith reported a very different state of public sentiment obtained in his district (Anaheim). He stated that there were about 50 men in that district, the owners of trees badly infested with red scale, and that no one was willing to do anything for their destruction. Some claim that a perfect killing of every scale on every tree must be done, and that if the Commissioner would furnish such a remedy, then, and not till then, they would employ him to kill them. But no such remedy has yet been found and probably never will be. But the scale are on the trees just the same, and it is only a question of time when the trees will be destroyed, and that time is very short.

Others claim that they cannot afford to kill the scale on account of the expense, unless their neighbors do the same; and so each makes excuse and nothing is done.

The unreasonableness of the demand of a perfect remedy needs discussion. If a remedy were ever so perfect the application of it must necessarily be imperfect. The causes are various and need no discussion. The red scale has come, and that to stay. The best that can be hoped for is to so reduce it as to make orange-growing profitable. This can be done either with spraying or with fumigation. But skillful and thorough work must be done, no matter which remedy is used.

To Kill Ants.

EDITORS PRESS:—"I'd like to know how anybody can live in such a country as this, with ants in everything you have to eat, drink, wear, or sleep on!" These words greeted me as I approached a house in my travels a few days ago. The language wasn't addressed to me but I answered it. "They're sent as a punishment, because you don't take the RURAL PRESS," I answered. "Well! if that will keep away ants we'll take it." Being fearful that you're not keeping so necessary information before the people, I wish to tell my "ant" experience. We had always been troubled with ants. Last winter my kitchen floor wore through, beside the stove. There were more ants than dirt under the floor, as one of my family expressed it. I had read in the RURAL about poisoning ants, so I placed among them under the floor a big dish of flour, lard, syrup, and arsenic thoroughly mixed; result, the pest of ants, which has grown worse every previous year, has been unknown this summer. Here in my office, 60 yards from the house, I keep a dish of the same "ant mixture."

Sanders, Cal. W. A SANDERS.

HORTICULTURE.

Grafting the Prune on the Apricot.

EDITORS PRESS:—The prune crop at this place, at Pomona, and in fact all through this section where trees are old enough to bear, has been a paying crop, and it has created quite a prune boom. Apricots have also borne quite well this season, though many of the trees had light crops, and the general opinion is against that fruit. Many apricot orchards had to give way the past season for the orange, and many more will the coming season. As most of these apricot trees are in a thrifty, vigorous condition, having been set in most cases only from four to six years, I would like to ask if they could not be grafted to the prune, and if so, at what time the operation could be most successfully performed. In my Eastern experience, we budded the apricot on the plum stock, also the peach stock; we also often change large plum trees to the apricot by the common method of cleft grafting, but in my experience have never grafted the plum or the prune on large plants of apricots, and I would like to ask through your paper whether it can be done successfully here, or whether there is any instance when it has been done.

I wish also a receipt for a grafting wax that will stand in this warm climate without running off in summer. We make a wax in New York of one part resin, two of beeswax and three of tallow, all warmed over a slow fire until melted. When thus melted, the mass is turned out into cold water and worked like candy until it is thoroughly mixed, after which it is made into balls and laid away in a cool place until wanted for use. If a little too hard when wanted for grafting, a ball is dropped in a pail of lukewarm water, when it will soon be in a fit condition for spreading over the wound made in the operation. If the wax gets too soft and sticky, grease the fingers before handling it. I. C. WOOD.

Ontario, San Bernardino Co.

[The advisability of using the apricot root for the prune in nursery propagation is a vexed point in our horticulture, for cases are frequently shown where the tree breaks off at the union, even after attaining considerable size, and shows that a good intergrowth of the two woods had not been made. On the other hand, some growers have prune trees on apricot roots which they find very satisfactory. Of the top grafting of the prune on the apricot, we would like to hear from those who have had experience. The question is, as our correspondent says, of much importance in his part of the State.

The method of making grafting wax is a good one. To prevent the wax from running in the sun, some of our growers in the hot valleys powder over the wax with fine brick-dust after the waxing is finished. This is said to fix the wax firmly. The use of waxed bands or strips of cloth dipped in wax is also satisfactory in hot localities.—EDS PRESS.]

A Fruit-Ladder.

As many of our readers are now busy picking fruit, and it is not always possible to reach all the fruit with an ordinary step-ladder, the following description of a fruit-ladder from one of the agricultural reports may prove useful:

Take a pole of any desired length, but not of large diameter, sharpen it at the top to a slim point, and several feet from the top put a flat iron band about it, or in case a band is not at hand it may be securely wrapped with wire to keep it from splitting. But the band should not be thick nor have sharp edges, else it may cut or chafe the bark of the tree. If the grain is straight it may be split with wedges from the butt to this band, or it may be split with a rip-saw. Now spread it at the bottom to several feet in width—if the ladder is to be quite tall this should be from five to six feet or even more. Nail a brace temporarily across the butt ends to hold them apart, and bore holes at proper distances and at proper angles; or if the spread is not too great they may be bored before the pole is split. Rounds of tough, strong material may now be inserted, beginning at the top, first removing the brace.

Such a ladder can be thrust upward into a tree and placed in a fork or against a branch without danger of falling or being unsteady, and it has the additional advantage of being very light at the top and easy to handle. If desired, a third leg or brace can be added by hinging it to the top round through a hole, thus making a step-ladder.

Eastern Report on Strawberries.

J. H. Hale of South Glastonbury, the well-known Connecticut fruit-grower and special agent of the census on fruit subjects, gives the following notes on his trial of strawberry varieties:

Of the well-known market varieties, Bubach clearly held first place as it did last year. The plant shows no sign of disease; very productive; fruit large and fine color; fully double as many large berries were obtained as from any other variety. Haviland ranks close up to Bubach in every respect except size; yet while it is not quite so large, it was so smooth and fair that on the whole it sold at rather higher prices than Bubach. Both were extremely early, and had no small berries at the last picking.

Warfield follows next in point of value, and for a shipping berry it will head the list. It certainly is now in all respects as good as the Wilson ever was in its best days.

Windsor Chief still holds first place as the most productive and profitable late market variety. During the rush of the season, berries sold in our markets at from 6 to 8 cents; but later, when the Windsor came on, it sold for 20 to 25 cents wholesale.

Crescent grows less productive and the fruit smaller in size each year. It is only a question of a very short time now before it must give place to Bubach, Haviland or Warfield, any one of which paid us more than double what the Crescent did this season.

For good family berries, Downing and Miner still hold leading place. Hampden, Monmouth and Pineapple prove to be of such little value that they will have to be discarded.

Of the newer varieties, Michel's Early is a wonder of plant growth. The bloom is perfect, the berries very abundant, are borne on string fruit stalks, are of good size and firm, and ripen earlier than any variety yet known. It is sure to be very profitable aside from its great value to plant with the early imperfect flowering varieties.

Yale is growing finely and promises to be a valuable *very* late sort.

Eureka is indeed "Beautiful Eureka." The plant is superb, quite prolific, the fruit of good size and form, and of such bright, glossy, scarlet color as to lead one to think they had been varnished.

Gandy is healthy and vigorous in plant; produced a moderate crop of very large, beautiful berries that sold for very high prices late in the season. We have planted it largely with the Windsor.

Summer Pruning of Deciduous Fruit Trees.

J. M. Edmiston of El Cajon, San Diego Co., writes for the *Great Southwest* as follows:

What, then, is the theory of summer pruning?

First. To make the branches short and stubbed so they can bear a heavy load without breaking.

Second. To increase the number of fruit-bearing branches and develop the fruit-buds near the trunk of the tree, where the weight of fruit can be supported, and where the fruit will be better shaded and better nourished.

The horticulturist who has practiced fruit-growing in the East, and who came to this coast with his former methods well fixed in his mind, must remember that here the conditions are very different. In the East, rains and cloudy weather prevailed to a great extent and sunshine was essential to the perfecting of the crop. Here, sunshine and dry air is the rule, making it essential to prune for shade instead of for sunlight. This principle will apply alike to all deciduous fruits, though the extent to which it should be carried will vary with the kind and with the several varieties of each kind.

Pruning does not make a tree more vigorous, or grow faster, but rather retards growth, and for that reason should be practiced so as to require but a slight pruning at any one time. If trees were constantly watched and any protruding branch pinched back, it would be better than a general pruning at set times.

If our heroic horticulturist, who thinks he must cut out great branches that the remaining ones may draw a double supply of sap, could realize that he is weakening and lowering the vitality of the whole tree, there would be less

stovewood made from our orchards. Against such butchery most earnest protest should be made.

Allow me to suggest to such person that if the next time he feels impelled to cut and slash his trees, he first take a shovel and pick, and fill up ruts in the public highway until his ardor is worked off, both he and the public will be the gainers thereby.

Some, however, insist that such pruning is all right if put off until winter. A better way would be to put it off until the tree is dead and make it all into stovewood at once.

This reminds me of a fruit-grower who, a few years ago, remarked to the writer that he had prunings enough from his orchard every year to supply him with firewood, and rather congratulated himself on his thrift and thrifty orchard. But a little later on he dug up his trees because they would not bear. He had pruned all vitality out of them.

How, then, should pruning be done? Simply shorten in the long branches.

If a tree throws out long, slender branches, like the apricot, prune, peach and some varieties of the pear, it should be cut back often, so as to avoid heavy pruning at any one time. It is better to clip such trees once in winter and twice in summer—say, as a general rule, in March, June and August. For trees that make a short growth, once in winter and once in summer would perhaps be sufficient. But as indicated above, the better way is to constantly watch every tree and never allow a branch to get beyond its fellows, and in that way keep the head round and dense.

If a tree shows a disposition to grow to one side, or, as is common, to lean from the wind, let the shears be applied to the branches on the heavy side of the tree, thus retarding growth on that side and developing it on the other. By watching in this way, a one-sided or leaning tree can soon be forced back to an equilibrium, and a perfect and beautiful head formed instead of an unsightly, deformed one.

The writer has practiced this method for 30 years with deciduous trees, and for nine years with orange trees, and does not hesitate to say that, as a rule, a leaning or one-sided tree is such from neglect.

It is not meant by this that small trees, while too slender to stand up against the wind, can be kept from leaning (except by staking), but that such leaning tops, as soon as the tree has size and strength, can be brought back to a perfect equilibrium by judicious summer pruning.

Should not the inside branches from the head of a peach or apricot tree be cut out? If we except dead branches and those that interfere, most decidedly no.

While visiting a neighboring apricot orchard not long ago, the owner complained that his trees would not bear, and that what fruit he did have was small, and asked what could be the matter.

A glance at his trees showed that every twig in the center of the tree had been cut out—not a fruit-bearing spur left in four to six feet of the trunk, and some great branches were bare even a greater distance. A little farther on another place was visited, and in reply to the question, "How are your apricots doing?" the answer came from a beaming face: "Oh! they are just immense." And sure enough, it was a sight worth seeing. The great branches, clear down to the trunk of the tree, were almost a solid cluster of fine, large fruit. Spurs not an inch long, on the rough side of branches two or three inches in diameter, had two or more fine apricots, and others only a few inches longer had more in proportion. The trees had been carefully shortened in in summer. The small branches inside with their fruit buds were well developed.

The other man had pruned the inside branches all off and with them his best fruit, and left the long ends untouched. He had admitted the sun to scorch the bark and dry the sap in its long journey to reach the fruit. The one had pruned off his best fruit buds, the other had preserved and fed them. A distinction *with a difference.*

Plant ng Too Deeply.

A correspondent (J. W. B.) writes as follows concerning the recent recommendation of a writer in the Santa Rosa *Democrat*, to plant trees so that the union of graft or bud is well below the surface: "It is said that the remedy is 'simple and easy' to prevent grafted trees from breaking off, by strong winds, namely, 'grafting or budding low and planting deeply so that the union will be well under the surface.' Now if he means by that to advise that a tree should be planted more than an inch and a half (certainly not more than two inches below the surface) deeper than the tree was before it was transplanted, then I say, however simple his remedy is, he may save the graft from breaking off, but the chances are he will lose his tree. I have had a great deal of experience in tree-planting. No matter what kind of soil, whether it be a new, loose loam or a rich old loam, if you plant too deeply you will lose your trees; indeed, there is more danger from deep planting than a little shallow planting. I was passing by, in the month of March, this present year, where they were planting trees. I looked on for a few minutes. I remarked: 'You are planting your trees too deep.' The answer I got was: 'The soil is dry and we must plant deep.' I said: 'You will smother your trees.' One month ago I saw the same trees, and more than half were dead and the balance were struggling hard for life.

"If your soil is light, tread the surface or press the soil around the trunk well and put some old straw or old manure around, which will help to retain the moisture. I took up one of those trees mentioned, while it still had some life, and examined the roots. The bark or skin of the roots sloughed off like the flesh of a bone that had been scalded. By my advice they scraped some of the soil away from those that were still living, and the trees showed signs, soon after, of a better growth, and put forth new leaves. I have seen trees that were nearly full-grown sometimes filled around the trunk by grading the ground, but even then they would not do well unless they were protected by boxing, keeping the soil from the trunk of the tree. A pear tree will stand a greater depth than any fruit-tree I know of."

AGRICULTURAL ENGINEER

The Future of the Sacramento Valley.

Hon. George Ohleyer of Yuba City writes for the *Evening Bulletin* as follows: The Sacramento valley and its drainage and navigable streams is growing to be a matter of deserved solicitude. For 15 years or more the cry for justice and for help has filled the air, and while at first it was weak and disunited, the unmistakable menace to the integrity of the rivers and to a matchless agricultural region has created a union of sentiment and feeling as widespread as the nation itself. That the thought should ever have found lodgment in any one's brain that we could better afford to sacrifice this fair domain to the demand of "Slickens" than to sacrifice the gold in the hills, is so astounding as to challenge belief, and yet an ex-Governor of California many years ago contended that it were better to sacrifice agricultural land than gold-bearing soil. Said he to the writer: "Since gold-bearing soil is limited and agricultural soil is not, there would be plenty of room for the agriculturists elsewhere than in the Sacramento valley." What a horrible idea! It is pleasant to know that such thoughts are no longer entertained anywhere, not even by those recently engaged in casting the mountains into the rivers. What the local public and press feared and predicted would happen to the country and navigation is found too true, and both State and National Governments have agents in the field to examine the situation and report conditions. It is a relief to observe that no scheme is advanced having for its object more than the correction of the evil existing—that the State and General Governments are not to be called on to legalize the further construction of debris dams for the use of private parties and to the detriment of public interests. Restraint may be useful, may possibly be imperative, but as a license to a further use of the public streams as dumping-ground, cannot be tolerated, and dare no longer be suggested by any one in authority. The people who have made such a self-sacrificing struggle, and who have been victorious at all points, watch with much interest the reports and suggestions of River Commissions, who are to say how the rivers shall be treated to furnish the relief demanded. Since, through natural causes, the lands from the Sutter Buttes to Suisun Bay are highest on the banks of the rivers, it follows that the displacement of water in the channels by sand threatens to engulf the borders and the lands beyond. The great tule basins, or storage reservoirs of surplus waters, were created for a wise purpose, and any interference with nature's plans will cause serious consequences to arable regions. The flood waters must be held in the channels as much as possible for scouring purposes, but at a certain elevation they will spread, whether barred or not by levees; hence relief-ways must be provided where they can do least harm, or they may escape by way of towns and cities or valuable farming sections.

That the great tule lakes exist is evidence that the valley is too flat to drain out to sea while the draining-in process is in operation, therefore their reclamation as a whole is an impossibility. The best that can be done is a partial reclamation, such as along the borders, leaving the greater and deeper areas, as nature intended them as reservoirs for the safety of arable land and to furnish a replenishment to the rivers when they require it.

The channels must be deepened by throwing the artificial fill on to their banks, or by scouring them out into the bays. This and the cessation of hostilities at the head-waters must go hand-in-hand, and is the first work to be done by the Federal Government. The whole of it is in the interest of navigation, and not for the purpose of reclaiming swamp or private lands, which has so often frightened away Federal engineers. The Government can't do less and do its duty; the plan cannot conflict with swamp-land owners. They have a right to demand a restoration of the original channels for the purposes of drainage, since they cannot drain their lands into an artificially raised channel. Occasionally it is intimated that the State must aid in the scheme of restoration, but this is fallacious. The General Government should, as it certainly will, restore the rivers to their original usefulness as far as possible. The State should not interfere with the plan or aid in the expense; she should busy herself in pressing the necessity on the higher power, and not rest until the demand is fully granted. A State interference, while it could do no good, would complicate responsibilities, if it did not drive the United States from the field; besides, State operations have resulted disastrously on more than one occasion.

Reclamation of swamp land is a separate question, and should not be confounded with river reclamation. The lands do not belong to the State, but are wholly in the hands of private parties, who stand obligated to reclaim them at their own expense. As already intimated, these owners have equities, possibly against the United States, but they have none against the State, and when it is bruited about that the next Legislature is to be asked to enter into another drainage scheme, by whatever name, the general taxpayer should be on the watch-tower and be ready to enter his solemn and emphatic protest. No arable soil should be taxed to reclaim private property, especially if such property consists of swamp land, and the State should go very slow in the attempt to reclaim its own swamp land. Something should be left to posterity, as the present burdens of the people are sufficient unto the times. Occasionally some one suggests the idea of reclaiming the tule basins by making them the receptacle of the mining sands now on their way to the bays, and possibly of those not started on their downward course. No scheme yet invented is fraught with greater mischief, were it practicable from a financial standpoint. As well might one attempt to break the fall of Niagara as to swing these rivers about at flood-time. But granted that it was done; for reasons already advanced, the basins are necessary for the life of the valley, and to raise them to the general level would send the floods from mountain to mountain and render the valley uninhabitable. It is a wild scheme, as impracticable from a scientific standpoint as from a financial view, and undeserving of a serious thought.

THE BOTANIST.

The Grasses of Washington.

SECOND ARTICLE.

The orchard grass, *dactylis glomerata*, is not so common in this State as it ought to be, though it is popular as meadow grass. It is about three feet high, with rough light-green leaves and a three inches long panicle. The spikelets are three or four flowered, and the glumes pointed and unequal. It adapts itself to any soil, climate and treatment, though it prefers not very moist, but clayish soil, and can be mowed three or even four times a year. It will also grow in forests if the underbrush is cleared off. Sheep prefer this grass to all others. Its remarkable power of enduring drought ought to recommend this grass to all the farmers. It is also less exhaustive to the soil than timothy, and when sown thickly, it forms a close and durable turf. The soil in the vicinity of Seattle is especially adapted for the growth of the orchard grass, and on Vancouver island it produces better pastures than timothy.

The genus *poa* is largely represented in this State. *Poa pratensis*, or Kentucky bluegrass, spear grass, and sometimes also called June grass, is used as a pasture grass and for lawns. Its growth depends, however, very much upon the condition of the soil. In some States, as, for instance, in Kentucky, it has met with great success in cultivation; in some others, again, it is less highly esteemed. It starts very early in the spring, and grows rapidly after being grazed off; it can also endure more frost and bad weather than most of the grasses. The Kentucky bluegrass is about two feet high, with numerous soft and long leaves, and sends many running shoots from the base. The panicle is from two to four inches long, and the spikelets are on short pedicels. In the famous bluegrass district of Kentucky it reaches the hight of three feet, and then the root throws off numerous long and creeping rootstocks, forming thus a dense matted tuft. It prefers sandy or gravelly fields, where in a short time it takes complete possession. Besides *poa pratensis*, there also grows in this State *poa serotina*, or fowl meadow-grass, with culms three feet high, and with five inches long leaves. It grows in the low lands and in the mountains, though it prefers rich, moist soil and wet, swampy places. This grass thrives best when combined with other grasses and adds much to the value of a sward. It makes a more soft and pliable hay than timothy. Another species, *poa tenuifolia*, is very common in this State, the Indians using its seed for food. It grows in bunches. *Poa andina* grows in dry localities, is about a foot and a half tall, and has short, rigid, pointed root-leaves. The empty glumes are large and broad. Other species growing in Washington are: *Poa Californica*, *poa cuspidata*, *poa nevadensis* and *poa occidentalis*, though there may be other species to be found.

The fall meadow grass, reed meadow grass, *glyceria arundinacea*, is found in the eastern portions of Washington. Its culm is stout, leafy and sometimes two feet long, and the leaves are often two feet long. The leaves are rough on the edges and its panicle is sometimes nearly 15 inches long. The rattlesnake or fall quaking grass, *glyceria Canadensis*, is found toward the boundary line, and it is a very ornamental grass. *Glyceria fluitans*, or floating manna grass, is very common in ditches and muddy places. Its seeds are very valuable in some countries, and are considered a great delicacy in soups. The birds and even fish are also very fond of these seeds, and the trout are always found waiting to catch every seed that falls in the water. This grass is about four feet high, thick and leafy. The nerved meadow grass, though sometimes wrongly called fowl meadow grass, *glyceria nervata*, is found in Eastern Washington. It is similar to the *glyceria arundinacea*, but it is smaller, with smaller flowers and a lighter panicle. It adapts itself to all kinds of soils and possesses very valuable properties as grass. It can stand a great deal of frost.

Of the genus *festuca*, the sheep's fescue, *festuca ovina*, is found in the eastern counties, and the bunch grass, *festuca scabrella*, in all other parts of the State. The first one is densely tufted, with numerous short and narrow leaves. The culms are slender and a little over one foot high, the spikelets from three to five-flowered. The second one, that is, the bunch grass, is much taller and has rigid leaves. It can grow at a very high altitude, sometimes at 7000 feet, and it is a good grass for cattle and horses, though perhaps too hard for sheep. It grows in strong clumps, and for this reason is rather a difficult grass to mow with a machine. *Festuca occidentalis* and *festuca microstachya* are also found in Washington.

The genus *bromus*, or the brome grass, is represented by a few species in this State. The chess or cheat (*bromus secalinus*) is regarded, though wrongly, by some farmers to be nothing else but a degenerated wheat. It is, however, not a very good grass. The spikelets are five to many flowered, outer glumes unequal and shorter than the lowest flower. *Bromus mollis*, *bromus pumpallianus* and *bromus hookerirnus* are other species found in this State.

The Italian rye grass, *Lolium parenne*, is introduced from Europe. It is a tall grass and very leafy, the culms terminating in a loose, spike-like panicle of about six inches in length. The Italian rye grass derives its name from the plains of Lombardy, Italy, where it grows in abundance. It is esteemed very high as a grass. Though it prefers inundated meadows, it can also stand a great deal of drouth. The poison darnel, *lolium temuteatum*, is found in grain-fields and is worthless as grass, the seeds enjoying a reputation of being poisonous to stock.

The so-called blue joint or blue stem, *agropyrum glaucum*, is very rarely to be met with in this State, though it is found here and there in the eastern counties. This is very good grass for hay or pasture, and it prefers saline soil. It grows single. Its culm is erect and rigid, and so are the leaves. The spike is short with large spikelets. The couch grass or quack grass, *agropyrum repens*, is abundant on the shores of San Juan de Fuca. Usually it forms a dense sod and has an abundance of foliage. Its culm is three feet high and its narrow spike of flowers over five inches long. It is not regarded as a good grass, but there is a diversity of opinion. The *agropyrum tenerum* is found everywhere in the Columbia valley, especially in moist meadows. It grows in clumps and is a good grass for hay. Another species, *agropyrum violaceum*, is found in the Cascade mountains and *agropyrum caninum* in the Columbia valley.

Hordeum jubatum, the wild barley, or squirrel-tail grass, is everywhere in this State, and it is regarded as a pest. Its barbed seeds are dangerous to the eyes and throats of animals and they penetrate the wool and flesh of sheep and lambs. *Hordeum murinum*, equally dangerous as the previous one, was introduced as ballast on this coast. *Hordeum pusillum* and *maristinum* were also introduced as ballast. *Hordeum pratense* is eaten by cattle when in a young state, but when mature it is worthless.

Of the genus *elymus*, the wild rye, rye grass, or lyme grass, *elymus Canadensis* is common in this State, especially in the gravelly banks of the Columbia valley. It must be cut early for hay to be of any value. Still more common is the giant rye grass, *elymus condensatus*, a strong coarse grass, sometimes over ten feet high, and with culms half an inch thick. Its leaves are also very long, but they are smooth. It makes an excellent hay. *Elymus triticoides* grows singly and is also a valuable grass. *Elymus Vancouverensis* and *elymus Columbiana* are found in Western Washington, and *elymus dasystachus* in the high mountains. The American rye grass, *elymus Americanus*, is found near Seattle.

Thus we have given a short description of some of the grasses growing in this State. We left out many of the species which we do not regard as being of any value for the agriculturist. Only the most useful or those which can become useful are mentioned here.—*M. Lopatecki, Ph. D., in Seattle Intelligencer.*

WHAT IS INVENTION?—The late Judge Hall of the Circuit Court of the United States said: "An invention, in the sense of the Patent law, means the finding out, the contriving, the creating, of something which did not exist and was not known before, and which can be made useful and advantageous in the pursuits of life, or which can add to the enjoyment of mankind. In other words, the thing patented must be new; and it must be useful to an appreciable extent, though the measure of that usefulness is not material. Any degree of utility appreciable by a jury is sufficient, upon the question of utility, to sustain a patent."

PATRONS OF HUSBANDRY.

In our Rural Press Official Grange Edition, issued every week, will be found additional matter from this and other jurisdictions, of interest and importance to Patrons. Any subscriber who wishes can change free to that edition.

A Farmers' Platform.

The following platform, which the Farmers' and Laborers' Unions of St. Louis Co., Mo., will pledge candidates to support unqualifiedly before voting for them, is too good to pass unnoticed. Why cannot all farmers and anti boss voters unite in one grand non-partisan body and sweep the State on such issues?

The Platform.

1. That the public lands, the heritage of the people, be reserved for actual settlers only, not another acre to railroads or speculators, and that all lands now held for speculative purposes shall be taxed at their full value.

2. That measures be taken to prevent aliens from acquiring title to lands in the United States and Territories of America, and to force titles already acquired by aliens to be relinquished to the National Government by purchase and retain said right of eminent domain for the use of actual settlers and citizens of the United States, and that the law be rigidly enforced against all railroad corporations which have not complied with the terms of the contract by which they have received grants of land.

3. That we demand the rapid payment of the public debt of the United States by operating the mints of the Government to their full capacity in coining silver and gold, and the payment of the same without discrimination to the public creditors of the nation, according to contract, thus saving the interest on the public debt to the industrial masses.

4. That we demand the abolition of National banks, the substitution of legal-tender notes in lieu of National bank notes, issued in sufficient volume to do the business of the country on a cash system, regulating the amount needed on a per capita basis as the business of the country expands, and that all money issued by the Government shall be a legal tender in payment of all debts, both public and private.

5. That we demand that Congress shall pass laws that shall effectually prevent the dealing in futures of all agricultural and mechanical productions, preserving a strict system of procedure in trial as shall secure prompt conviction, and imposing such penalties as shall secure the most perfect compliance with the law.

6. That we demand a graduated income tax, as we believe it is the most equitable system of taxation, placing the burden of government on those who can afford best to pay, instead of laying it on the farmers and mechanics, exempting millionaires, bondholders and corporations.

7. That we demand a strict enforcement of all laws prohibiting the importation of foreign labor under the contract system, and that all convicts be confined within the prison walls, and that all contract systems be abolished.

8. That we demand that all means of public communication and transportation shall be owned and controlled by the people and equitable rates everywhere be established on the same basis as the United States postal system.

9. That we demand the election of all officers of the National Government by a direct vote of the people, and that all willful violations of the election laws be declared a felony and a part of the punishment be the prohibition of the party convicted from voting in all future elections.

10. That we demand a repeal of all laws that do not bear equally on capital and labor, the strict enforcement of all laws, removal of all unjust technicalities, delays and discriminations in the administration of justice.

11. We demand such a revision of the tariff as will lay the heaviest burdens on the luxuries and the lightest on the necessaries of life, and as will reduce the income from imports to a strictly revenue basis.

12. That we demand that the Government shall protect the civilized Indians in all of their inalienable rights, and shall compel railroads and other wealthy syndicates from overriding the law and treaties now in existence for their protection.

13. That we are unqualifiedly in favor of the education of the masses by a well regulated system of free schools.

14. That we demand that no patents shall be renewed after the expiration of the time for which they were originally patented.

15. That this body will not support any man for Congress, of any political party, who will not pledge himself in writing to use his influence for the formation of these demands into laws.

16. That the chairman of this County Union shall present these resolutions to all candidates for the Legislature and Senate and ask them to pledge themselves in writing to the demands herein, and if any candidate refuse to pledge his support, then it shall be our duty to defeat said candidate regardless of what party he may belong to.

Form of Pledge.

I hereby pledge myself to work and vote for the above demands, irrespective of party caucus or action.

The Master's Desk.

E. W. DAVIS, W. M. S. G. OF CALIFORNIA.

The grain and fruit harvests are fairly over for 1890, but is the Grange harvest finished? O no! Now is the time to "gather them in." Let old Granges be reorganized and new ones be chartered. For the next 90 days the California farmer, in most sections of the State, has his leisure time. Why not all hands join in booming Grange-work? If the members of the Order will put forth some little effort, the results will be more than gratifying. The farmers are ready for some organization that will bring relief from overtaxation and at the same time offer considerable reward in the way of social and mental culture. Such an organization is the Grange, and such are some of the rewards it offers. Try it, fellow-producer! Help the Grange by your influence and membership. It will help you in return. Remember, this is the day of reciprocal relations!

Get thoughts! They are useful companions and profitable investments. Good thoughts are always in demand.

The coming State Grange session promises to be one of great interest. There will be an amendment or two proposed to the Constitution of the State Grange, and one or two to its By-laws; then the question of amending the National Grange Constitution, so that each State Grange may determine for itself the membership fee, will be considered. To these important subjects, add the BALLOT REFORM LAW, which has been proposed, and will, no doubt, be brought before the Grange for approval. Then, too, comes a plan for Mutual Fire Insurance; the Trade-Card plan, as proposed by the Executive Committee, ought to be considered; the usual reports; election of a member of the Executive Committee and conferring of degrees. From this, it seems we will have something to talk about and something to do. Let us then be up and preparing for the work of the session.

Sister Alling, of Stockton Grange, has given us a program which is truly grand. If that sort of work will not make a Grange succeed, then a Grange will not succeed. All honor to such "Woman's Work" as is outlined by the fair and thoughtful sisters of Stockton. May the good work go on. "May brotherly love prevail and every moral and social virtue cement us."

Railroads organize their forces; why not have as complete an organization among the farmers?

Brother C. G. Luce, Past Master of Michigan State Grange, hit a big nail square on the head when he said: "The Grange was organized and is maintained for five distinct, though kindred, purposes, to wit, (1) to improve the farmer, his wife, sons and daughters intellectually; (2) to improve him morally and to strengthen and unify the moral forces found in rural homes; (3) to elevate and improve socially; (4) to protect and benefit him financially; (5) to increase his political power." There are very few persons who have kept themselves well posted about Grange affairs but will admit that the Grange has done wonders in the directions above referred to by Bro. Luce. The farmer of to-day is one whose patronage and influence are everywhere courted. His presence is welcome; his opinion is considered; his credit is sought; his name is honored, and his family respected and intelligently received by the best part of society. For all this the Grange ought to receive a large share of credit. Why not pay honor to whom honor is due? Why not respect an organization that helps to educate, to elevate and to dignify labor and laborers?

The General Deputies are rounding up their work in good shape. By the time the State Grange convenes, few, if any, of the subordinates will not have been visited by some one representing the State Grange.

Two Rock Grange, Sonoma county, is to dedicate a new hall Sept. 18th. This is the first hall dedicated to the uses and purposes of the Order in California during the year 1890. Everybody who loves the Grange is invited. A big crowd is expected and a good time is assured.

It will not be very surprising, the way our sisters are taking hold of Grange work, if, in a short time, the best work done for the Grange will be done by the sisters—"Woman's Work in the Grange" is being well and energetically done. May the brothers emulate their example!

Don't you feel that farmers appreciate the value of the Grange? They may not appreciate its worth to the fullest extent, but that they do value it is proven by the fact that more new Granges have been organized thus far in 1890 than were organized in the whole of the year 1889. The world moves forward, and the farmer is in line!

FARMER VS. LIQUOR.—Geo. T. Elliot, a Hollister Patron, called on us early this week. Bro. Elliot is a worker in behalf of prohibition, and had engagements to speak at Suisun, Tuesday, Sept. 2d; Dixon, 3d; Woodland, 4th; Williams, 5th; and Cuss, 6th.

The Country Aroused.

The *American Grange Bulletin* for Aug. 14th has a good deal to say editorially of the general uprising among agriculturists. We quote as follows:

The air is full of rumors concerning the Farmers' Movement in various sections of the country and politicians are stirred up as never before. A new political party and the smashing of old ones are hinted at, and in some sections a new party is not only advocated, but actually placed in operation. Everything, upon every side, so far as the farmer is concerned, shows unrest and dissatisfaction with the present state of affairs.

Now, what does all this mean? What cause has the farmer for being so stirred up and dissatisfied? If one had a complete cyclopedia of the causes before him, he could not more accurately tell than can the farmer who has thought and studied over passing events and felt the heavy shadow of poverty coming over him through merciless and unjust class legislation. It is foolish for any one to assume that American agriculture is in good and improving condition, as did a reputable U. S. Senator not many days ago upon the floor of the Senate. We do not assume that agriculture is upon its last legs, or that the farmer is so much of an imbecile that he cannot right all wrongs; but we do assert, without fear of successful contradiction, that for the past 25 years legislation, both National and State, has been vicious, for the few against the many, and the farmer generally made the pack-horse.

Class legislation is one of the curses of the age and must be stopped; *partisanship* is another and deserves the condemnation of all farmers, for through it they have too long been separated; but the day is breaking and by this uprising of the farmers of the nation will come the unification of the people, with the one object of purifying all corrupt places and securing a Government "of the people, by the people and for the people."

This movement *means* that the old guard has been called into service, and as did Cincinnatus of old so are the farmers of to-day leaving their plows standing in the furrows and responding to the call of patriotism and the cause of freedom.

It appears to us that every intelligent farmer must realize at this time the foolishness of the past, and be ready to subordinate partisan prejudice (too often mistaken for principle) to the necessity of the farm and home. None but foolish farmers sacrifice their personal interest on the altar of party. We hope their number is rapidly growing less. For farmers, successful action means relief and freedom; for machine politics and rascality in high places, death. There can be no further compromising with these evils. The farmer means business in this movement, and will not cease until successful. The spirit of independence is abroad in the land and is an inspiration from God.

The most thoughtful farmers, however, realize that class political organization cannot succeed, and would not promote the welfare of our country. Votes usually decide elections, and the farmers have not a majority of the votes in this country; hence, if we would succeed, we must put our votes where they will do most to promote our welfare. Nearly all the farmers are now associated with existing parties, and it takes a severe wrench to sever the connection. It ought not to be a difficult matter to get them earnestly at work in their party organizations to secure a fairer representation of farmers in legislative bodies. The farmers never will be fairly treated until they secure full representation.

It is highly probable that some radical steps will be necessary before the politicians will deal fairly. A few farmers nominated by the minority party will have to be elected before a needed lesson will be perfectly learned. This lesson will have to be taught by the intelligent, brave men among the farmers. The Grange and its members have been for 20 years the trusted leaders in this movement, and to-day ask for unity among farmers, to the end that agriculture may be placed in its proper position among the callings of men. She asks not for new parties, but purification of old, and points with pride to the Grange Declaration of Purposes as a document covering remedies for all evils.

From Kibesillah.

EDITORS PRESS:—Past Master Coulter has come and gone, and the members of this Grange thank the brother for the compliment he gave us for the work of the past year. He attended our Grange meeting August 9th, and at the appointed time (the day following) we had the pleasure of hearing him speak. He defended our cause as a true Patron should. The duty of a farmer's wife was the subject of a part of his address, which I hope will take effect in this vicinity. Come again, Worthy Brother; your assistance is what we want, and a good lunch awaits your presence at all times.

How often farmers ask: "What benefit would the Grange be to us?" when it is the only organization that points to protection, where their wives and daughters have a chance to demand justice and their voices can be heard as good Matrons, working to exterminate their evil surroundings. I should ask those same old farmers what good have *they* done the last quarter of a century? They have done nothing, with all their hard labor, but oil the wheels of political machinery. I wish they were as willing to come to the Grange and see what good it can do for them as they are to loaf in a gin-mill or perch themselves on a dry-goods box in front of some shop, waiting for some machine to make a noise that will arouse their patriotic sentiments. Let them come to the Grange with their wives and daughters and all become good Matrons and Patrons, and they will go home convinced that the Grangers need no political machine in their fields.

Remember, you poor brow-beaten farmers, that impressions are often mistaken for principles. Individuality is needed. The great want of our cause is men who both think and act for themselves, studying how they may become more and more useful. The gates of our fields will be opened to all those who are worthy. Come and see what we have done and what we are doing, then you can tell what is the good of the Grange!

Reviewing the work of the past year in our Grange, it is a pleasure to state that we have gained in membership on an average one a month.

Noting the progress we have made, the subjects we have had before us for consideration, and the interest the officers and members have taken in the advancement of our Order, I hold to my opinion that the Grange is the only protection the farmers have. It has proved to be a plant that never fades, and has stood the test where others failed. Matrons and Patrons! don't forget the Grange motto, but let us all press onward together.

We are under many obligations to our Worthy State Master and Secretary for the interest they have manifested in our welfare. We hope to repay them by laboring faithfully, to make the Grange a success. Fraternally,

L. L. WOODROME, Sec'y.

Kibesillah, Aug 17, 1890.

Going to State Grange.

[Written for the PRESS by MRS. MARA B. LANDER.]

Now comes our annual question: Who and how many are going to the State Grange? Watsonville has made her call, and every good Patron's desires and interest ought to respond favorably. Political reverberations are filling the air, while the snowy heads of our Pioneers are conferring with the bright, unfaded locks of Native Sons and Daughters how best to make known their thankfulness that "Westward Ho!" made the 9th of September, 1850, Admission Day, and on this day was set the Bear Flag's seal to the brightest, fairest of all fair States—the doubly favored one whose auriferous shores were laved by Pacific's splashing waves and christened the Golden State. All hail! say we to the Pioneers who braved hardship and danger to plant the stars and stripes above our grand mountains and fertile valleys, and all success to their sons and daughters who are fostering and building a Statehood beyond the conceptions of our revered 49-ers. Pioneers found gold; years later their children planted these same shining sands, and in conformity with agricultural law courted sunshine and dew by scientific manual labor until now the whole United States reaps the products of our golden soil in the rich and fragrant orange and lemon, luscious grapes, varied with the peach, apricot and pear; supplementing these are the olive, with fruits and nuts of the tropics. Fostering such growths, comparing and balancing the needs of the north, south, east and west, is our Grange mission to Watsonville; and that our pilgrimage may be successful, fathers, mothers, sons and daughters are needed to bring about that unity of action which is the condition of strength.

Brothers, you need recreation; your wives, daughters and sons should follow in the footsteps of Mother Nature and seek such rest as in her gracious beneficence is given to flower, shrub and tree. Can you find a more profitable or pleasurable outing for the year than to go to State Grange? There may you compare notes, brother with brother, and fix upon best methods not only of maintaining your rights, but how to demand them. Sisters! can we not leave stitching, mending, cooking, preserving and cleaning for a week's airing? To go near the coast and breathe that invigorating, bracing air—oh! what does that not mean to the tired housewife! Does it not betoken almost a new lease of life, nay, a brightening of the present hot days even to think of it? Patrons of California! let thoughts of going be but a forerunner of the flitting, and our State Master and National Steward will answer for California this winter in Atlanta: *Well done. Well done* Ho for Watsonville!

Martinez.

A GRAND NOMINATION.—The Republican Convention of the Sixth Ohio Congressional District has placed in nomination for Congress our worthy brother J. H. Brigham. If he is elected—as we hope he will be—agriculture will have a most able advocate in the National Legislature.

YUBA CITY GRANGE expects that eight and perhaps ten of her members will attend State Grange—so W. Sec. Walton writes officially—and Bro. B. F. Frisbie has been duly chosen alternate.

Notes from the Fairs.

Petaluma—4th District.

The fair of the 4th District (Sonoma and Marin) Agricultural Association, held August 25th to 30th, proved one of the most successful that has ever taken place at Petaluma. Stall room and pavilion space alike were in great demand, and many visitors attended; but the *Bulletin* scribe, on the 29th, reported three-card monte men and fakirs conspicuous by their absence, and the crowds good-natured and orderly throughout, not a single disturbance nor arrest having occurred so far.

At the stock parade Friday morning, Percheron and Clydesdale stallions, blooded mares, roadsters and farm horses to the number of 100 or more filed past the grand stand, to the admiration of beholders. One of the stallions, born and raised in Petaluma township, a cross between a Norman and a Clydesdale, is a magnificent gray, standing fully 18½ hands high and weighing 2100 pounds. His sire, Pointsman, was the largest horse ever known, weighing 2500 pounds.

The paddocks were given up to cattle, and there was a great display of Holsteins, Jerseys, Red Polls and graded cattle, whose sleek coats and plump sides testified to excellent care and feeding. The high standard of the district was fully kept up in this respect, as also in the pigs and sheep, some fine examples of the latter being shown. There was also a fair display of poultry.

The interior of the pavilion was tastefully decorated with the national colors, interspersed with the banners of the different counties. In the center was a fountain surrounded by ferns of different varieties, and directly in front, embowered by exotic plants, was a ferocious-looking Sonoma county bear (stuffed), said to have been slain by Sup't Elder.

For several reasons, chief of which was last season's protracted wet spell, the exhibit of farm products was rather smaller than usual, and hardly up to the standard of former years. At the same time, whatever was shown, whether vegetables, fruit or cereals, presented a very fine appearance.

A notable feature was the exhibit of John Ennis of Petaluma, who, on his five-acre lot in the town limits, has raised a crop of almost every variety of fruit, from the proceeds of which he more than comfortably supports himself and a large family. (A relation by Mr. Ennis of his methods in bringing about the results attained would doubtless be welcome to many.)

The largest individual display of farm products was made by Mr. Andrews of Two Rock. It embraced apples (10 varieties), barley, beans (shelled, seven varieties), beets (blood, sugar, Tankard), Briza grass, citrons, cantaloupes, castor beans, catalpa tree, caterpillars (vegetable), cotton, carrots (two varieties), endive, Egyptian corn, figs, flax, Georgia cane, grapevine (*vitus Davidi*), hemp, husk tomato, Momordica, mesquit grass, melons (water and musk, Florida alligator, hybrid), okra, passion vine, peaches (six var.), pie-plant, pumpkins, pears (five varieties), peanuts, pomegranates, radishes, salsify, Sainfoin hay, squashes, turnips, tobacco, tomatoes and wheat—34 different products, tropical and temperate, grown on one farm in Sonoma county!

The Petaluma cannery had a model exhibit of fruit in jars, arranged in the shape of a pyramid. The famous Petaluma incubators, and the churn with "a patent back-action, reverse and turn-around movement" attracted much notice. The ladies as usual made a grand showing of culinary productions and needlework.

Chico—3d District.

Butte, Colusa and Tehama counties make up the Third Agricultural District, whose fair came off at Chico the last week in August. The correspondent of the *Bulletin* says: The live-stock show this year is much smaller than last. Judge Bridgeford's fine herd of Durhams was not sent down from Colusa, nor is there any of Senator Stanford's or Gen. Bidwell's stock. As is well known, Gen. Bidwell will not display fruit or stock at the fair, because he does not approve of the gambling which is thought a necessary part of the horse-speeding, and he will in no way aid the exhibition while the directors permit the feature he considers objectionable. The space at the park made for fat cattle and stout pigs is taken up with horses, more speeders being here than ever before. The races have been fairly good, as races go.

As to the horticultural output, it was remarked that ever since cherries and apricots began to ripen, Butte's best fair has been in progress in the markets of Chicago and other Eastern cities. The fruits of these prolific orchards are "too well known to need displaying and too valuable to keep for home showing," and so the pavilion exhibit was not up to the standard of preceding years. And yet, says the same reporter, "if a Connecticut farmer could see the fruit show at the pavilion he could not well see anything in the quality to criticise. Clusters of luscious Muscat grapes, neatly packed boxes of figs, big fragrant peaches and red-cheeked apples are piled up carelessly, as if to give the impression that their production is so common as to be unworthy of comment. There are dried fruits also, fine as any brand, choice prunes, huge melons and samples of choice cereals. Inquiry would tell the stranger that all these marvels of profitable fruits came from the hills and valleys near; much of it from lands which, only a few years ago, could have been bought inside of $10 an acre, and some for less—land that old-timers always thought fit only for sheep-grazing."

J. H. SETTLEMIER, PROPRIETOR WOODBURN NURSERY, WOODBURN OR.

Among the finest displays were those from the orchards of B. F. Allen, W. V. Groves, John H. Guill, James Hegan, Mrs. Wookey, John Shannon and J. G. Curtis.

A few excellent specimens of Black Tartarian cherries, picked from the trees August 25th, were shown by Miss May Cox of Forbestown.

James Finlay, living near Chico, showed a lot of choice cocoons. He has large mulberry trees and would make more of sericulture were there encouragement to do so profitably.

A striking display of rare plants was made by Mrs. C. G. Warren, and lovely flowers in great variety were exhibited by Mrs. Guill, Mrs. Snook and Miss Maggie Shannon.

Placerville—8th District.

The 20th Annual Fair of the Eighth Agricultural District took place last week at Placerville. The exhibition was formally opened on Tuesday by Hon. G. J. Carpenter, president of the society. On Wednesday evening, Hon. Thomas Fraser delivered the annual address.

The *Mountain Democrat* says: Owing to the dropping of a race program from the lists this year, few outside people are in town, and the place is very quiet. When the Opera-house was thrown open to the public, the few who were in attendance were greatly surprised to find one of the most varied and extensive displays of the products of the soil yet made in El Dorado county. As the fact became noised abroad, the attendance increased, and during the past two days the usual number of visitors have been at the hall.

Several new exhibitors put in appearance this year, one notable one being Louis Rieber of the Six-Mile House, whose display is one of the most comprhensive, thorough and best-arranged of any in the hall. It included 4 varieties of nectarines, 4 of prunes, 10 of plums, 25 of peaches, 12 of pears, 34 of apples, 2 of cherries, dried fruits, 4 varieties of watermelons, several of muskmelons, a sack of hops, several sacks of cereals, a fine box of assorted seeds raised on the ranch, tobacco, squashes, pumpkins, and all sorts of vegetables, besides dressed deer skins.

Lack of space forbids more extended notice—at least in this issue.

Farmers in Council.

A dispatch from Council Bluffs, Iowa, announces that the 10th Annual Session of the National Farmers' Congress opened in that city on the 26th, with 200 delegates in attendance from 23 States.

The Opera-house, in which the convention is held, was packed to overflowing. Gov. Boies welcomed the Congress on behalf of the State of Iowa. John Scott delivered an address of welcome on behalf of the farmers of Iowa, and Rev. G. W. Crofts of Council Bluffs read a poem reiterating the welcome. Hon. A. W. Smith of Kansas and F. L Nesbit of Alabama spoke on behalf of the Congress, after which Pres. Kolb delivered his address.

At the afternoon session a resolution from the Wichita, Kansas, Board of Trade, demanding the passage by Congress of the Anti-Option bill, was presented, and after a heated discussion referred to the Committee on Resolutions.

Fifty more delegates, raising the number of represented States to 30, were expected on the 27th.

In his address, Pres. Kalb reviewed the condition of the farmers. He spoke of the decrease in agricultural wealth and said: "This decrease is all the more shocking because the aggregate wealth of the country has immensely increased." He followed the history of the last 40 years and blamed the protective tariff as being responsible for the farmers' present condition. Referring to the Farmers' Alliance, he called it a grand body, the object of which is to free agriculture from its thralldom.

Prof. W. T. Chamberlain of the Ames, Ia., Agricultural College, read a long paper on "Existing Facts and Laws that Injure Agriculture," and Prof. Atwater of the experimental station at Washington, D. C., spoke of the work of that institution.

Fairs to Come.

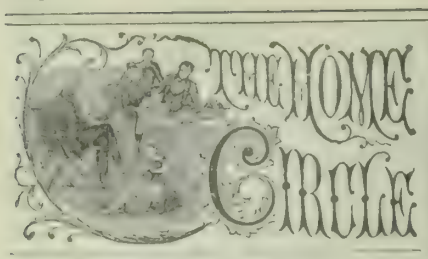
In the following list of fairs, occurring this week and yet to be held, some additions and changes of dates have been made since its last publication in August.

Oakland (1st Dist.), Sept. 1-9
Marysville (13th Dist.), Sept. 2-6.
S. L. Obispo (16th Dist.), Sept. 2-6.
Auburn (20th Dist.) Sept. 2-6.
California State Fair, Sacramento, Sept. 8-20.
Bishop (Eastern Slope), Sept. 10-13.
Santa Maria, Sept. 10-13.
Oregon State Fair, Salem, Sept. 15-20.
S. F. Mechanics Institute, Sept. 18-Oct. 25.
Nevada State Fair, Reno, Sept. 22-27.
Stockton (2d Dist.), Sept. 23-Oct. 4.
Rohnerville (9th Dist.), Sept. 22-26.
Quincy (11th Dist.), Sept. 22-27.
Lakeport (12th Dist.), Sept. 23-27.
Nevada City (17th Dist.), Sept. 23-27.
Independence (18th Dist.), Sept. 23-26.
Concord (23d Dist.), Sept. 22-27.
Redding (27th Dist.), Sept. 23-26.
Southern Oregon, Central Point, Sept. 22-27.
No. Pac. Industrial, Portland, Sept. 25-Oct. 25.
Salinas (7th Dist.) Sept. 30-Oct. 4.
Fresno (21st Dist.), Sept. 29- Oct. 4.
Escondido (22d Dist.), Sept. 30-Oct. 2.
Yreka (10th Dist.), Oct. 1-5.
Watsonville (24th Dist.), Oct. 1-4.
Spokane Falls (N.W. Ind. Exp.), Oct. 1-Nov. 1.
Walla Walla, Oct. 6-11.
Susanville (Lassen Co.), Oct. 6-10.
Visalia (15th Dist.), Oct. 7-11.
Arroyo Grande, Oct. 8-10.
Los Angeles (6th Dist.) Oct. 14-18.
Santa Cruz (14th Dist.) Oct. 15-18.
Santa Barbara (19th Dist.), Oct. 21-25.

KERN COUNTY PEACHES.—We have received from the Land Department of J. B. Haggin a fine sample of Orange Cling peaches grown in Kern county. They are of grand size, belting from 11 to 11¼ inches, and carry their own demonstration that Kern county has good peach lands.

An Enterprising Nurseryman.

With the rapid development of the fruit-producing interests of the Northwest that has been in progress during the past few years, and is gathering force from its own momentum, there has grown up a demand for first-class nurseries to provide stock for the young orchards. The Pacific Coast has had nurseries ever since it began to raise fruit, and the mildness of the climate tended to encourage the establishment of fruit-propagating farms, but the number of nurseries that have an extensive business and a standing reputation is limited. Clearly at the head of the list stands the well-known nursery of J. H. Settlemier, at Woodburn, Oregon.



Mr. Settlemier was born in Jersey county, Illinois, Feb. 5, 1840, and at the age of nine years removed to California with his parents, who were attracted there by the gold excitement of 1849. They crossed the Missouri river at St. Joseph, and at that time there was not a settler between the Missouri and the Sacramento valley; there was not a wood or brick building in Sacramento, and San Francisco had scarcely attained the dignity of a village. The mother and one of the boys died in California shortly after arriving there, and the rest of the family came on to Oregon the next year and took a donation claim in Marion county, where Mount Angel now is, and where the father still resides at the age of 83 years. Oregon City was then the metropolis of this uncertain empire, and Milwaukee and Portland were rivals for second position, with the chances of success in favor of the former. Young Settlemier spent his youth on the farm and in the small nursery which his father had. The nursery absorbed the attention of the young man, who obtained a thorough knowledge of the business and at length started on his own account. Going to Woodburn, in the same county, he laid the foundation for what has since grown to be by far the largest nursery in the Northwest.

Woodburn Nursery is the name Mr. Settlemier has given his fruit-propagating plant. It occupies the whole of 115 acres of ground situated on both sides of the railroad track at the pleasant little village of Woodburn, which is south of Portland 35 miles and at the junction of the Southern Pacific main Oregon line and the Oregonian narrow-gauge railway. Mr. Settlemier is the founder and proprietor of this town. It is six miles from the Willamette river. It has the best public school outside of Salem in the county, and, though it is quite an important shipping-station and a local trading-center, the nursery of Mr. Settlemier constitutes the most extensive enterprise there. This is constantly being enlarged, increasing about 50 per cent annually.

There are now in the Woodburn nursery one and three-quarter millions of trees and plants. These consist of a full line of fruit, shade, ornamental and nut trees, and vines and plants from different sections of America and Europe, including a most extensive assortment that could not be enumerated in anything short of a voluminous catalogue, and the quality of the stock is the choicest on the Pacific Coast. Last season Mr. Settlemier imported from France 70,000 young trees, mostly of the *plumora formosa* family, one of the finest evergreens known. Among them are the most popular trees of foreign nativity—double white and red flowering horse-chestnuts, Italian chestnuts and Norway maples. His importations also include 11 varieties of apples and 20 varieties of winter pears. Mr. Settlemier cultivates many rare and curious plants for his own enjoyment, among which are Asiatic and South American specimens, and it is well worth one's while to look through the very interesting collection of this class, as well as the general stock of the nursery. Mr. Settlemier personally receives visitors and is always pleased to show the nursery to those who may call. Catalogue mailed free upon application.

The trade of Woodburn nursery extends throughout California, Utah, Oregon, Washington, Idaho and British Columbia. Supplying nurserymen and dealers is a specialty of the business, and it is rapidly increasing. The removal of the tariff on trees shipped to British Columbia has opened an important field there for this business. Many California orchardists and nurserymen buy their stocks of the Woodburn nursery, because the trees are found to be superior to the California production and free from pests. Trees and plants propagated by means of irrigation, which is the rule in California, are of inferior quality and never yield as satisfactory results as those grown where the natural conditions are entirely favorable. The climate of Oregon is peculiarly adapted to the successful prosecution of the nursery business, as well as the general cultivation of fruit. The prices prevailing here for first-class nursery stock are about one-fifth less than those quoted by Eastern catalogues, and Eastern competition cuts no figure in the business.

This summer 450,000 trees are being budded in Mr. Settlemier's nursery, this method being preferred to the more common one of grafting. Budding serves the same purpose, is more quickly and easily done, and is attended with less risk. Grafting is done in the spring, when any defective buds are attended to. Mr. Settlemier has made a study of his business, and his long experience and unexcelled facilities for keeping up with the times in all improvements place him in the front rank of nurserymen.—*West Shore, Aug., 1889.*

Where She Comes.

With heavy elders overhung,
Half hid in clover masses,
An old fence rambles on, among
The tangled meadow-grasses.
It makes a shade for lady-fern
Which nestles close beside it;
While clematis, at every turn,
And roses almost hide it.

In shade of overhanging sprays
And down a sunny hollow,
By hazel copse, and woodland ways,
The winding fence I follow;
By rose, and thorn, and fragrant dew,
In search of something sweeter—
The orchard-gap, where she comes through,
And I go down to meet her!

The sunlight slants across the fence,
Where lichens gray it over,
And stirs a hundred dreamy scents
From fern, and mint, and clover;
But though the air is sweet to-day,
I know of something sweeter;
That she can only come this way,
And I am sure to meet her!

And so, while chipmunks run a match
To tell the wrens who s coming,
And all across the brier patch
There sounds a drowsy humming—
The hum of honey-seeking bees—
I seek for something sweeter;
A gap, among the apple-trees,
Where I am going to meet her!

—*C. B. Going in Scribner's Magazine.*

The Life Worth Living.

[COPYRIGHTED BY LESLIE'S WEEKLY.]

A man is to be measured by his ability and desire to contribute to the well-being of society. Almost all our best possessions take their richness from the fact that we are linked to others by the social tie.

Gold, fine homes, grand attainments, would mean but little if we dwelt alone. A man is great, not by any fictitious rank of birth but by his ability to do his part, to render some adequate equivalent in the transactions of life. The true man's self-respect will forbid him to accept the bounty of society, offering nothing in return.

No possible exaltation can exempt a man from his obligations to his fellows. Each one, however humble, who can contribute a feather's weight of influence toward the weal of society may more deserve our regard than the titled prince.

"All are needed by each one,
Nothing is good or fair alone."

In this broad land we are free and equal. We are entitled to "life, liberty and the pursuit of happiness." We reach the loftiest conception of our greatness when our deepest satisfaction is found in our ability to aid the world.

Mere love of acquisition without a noble purpose is but an animal instinct. However poor in gold, each one of us has his personality to offer to the welfare of the world. Benedictions will not be wanting from the army of toilers for the manly man of even wide estates whose great heart and sympathetic spirit keep him close to the weal of men. What word have we to say to the vast multitudes in our land toiling and struggling in "the rage to live," which makes all living strife? The poet, the philosopher who isolates himself from the throbbing life of man, is a poor failure; is tracing the laws of social life in a humanity that has no being. It should be easy to tell the boy, when historic names are in the mind, that he who floats to glory on some "tide in the affairs of men, taken at the flood," is less a hero than the grimy toiler who simply does his best.

The girl, dreaming of castles and splendor just a little beyond, should be taught to see the nobler fact that the spirit of queenly womanhood is the ambition to be useful as well as to be easily pleased with what life can bring.

"Work without hope draws nectar in a sieve,
And hope without an object cannot live."

For ourselves, we ought to look with a genuine and hearty respect upon the man who toils; help him to respect himself; count ourselves among the great army of laborers, with loyal love for the great families of the earth; forbid the narrow spirit of feudalism to taint the free air of this Western Continent; seek to lift society to that inspiring conception of labor, live in hopeful and helpful and willing action—the *only* life worth living.

THE Indiana Republican who wanted to horsewhip Harrison is dead. He got over the horsewhip mood and took the President nearer where he lives. He gave him a span of horses, so he could do his own horsewhipping.—*Alta*

"SHOULD we keep our vests in the vestry?" asked Gilroy. "Yes," replied Larkin, "and our coats in the coterie and likewise our trousers in the pantry."—*Bazar.*

Tobacco—A Short Essay.

By a Boy Who Knows All About It.

Tobacco grows something like cabbage, but I never saw none cooked. I have heard men say that cigars that was given them election days for nothing was mostly cabbage leaves.

Tobacco stores are mostly kept by wooden Indians, who stand at the door and fool little boys by offering them a bunch of cigars which is glued into the Injun's hands, and is made of wood also.

I tried to smoke a cigar once, and I felt like Epsom salts.

Tobacco was invented by a man named Walter Raleigh. When the people first saw him smoking they thought he was a steamboat, and were frightened.

My sister Nancy is a girl. I don't know whether she likes tobacco or not. There is a young man named Leroy who comes to see her. I guess she likes Leroy. He was standing on the steps one night, and he had a cigar in his mouth, and said he didn't know as she would like it, and she said: "The perfume is delightful!" But when my big brother Tom lighted his pipe, Nancy said: "Get out of the house, you horrid creature! The smell of tobacco makes me sick!"

Snuff is Injun meal made of tobacco. I took a little snuff once and then I sneezed.—*Sel.*

The Vestals.

Although much has been written to show that woman is held in higher esteem in this than in former centuries, yet history records that certain honorable rites and ceremonies were assigned to woman to perform, even in the olden times. Our engraving shows the "vestal virgins," priestesses of the old Roman goddess Vesta, at their occupation of maintaining the sacred fire in the temple of their goddess.

None can contemplate otherwise than with pleasure, gratitude and commendation, the mighty practical results accomplished by the mothers, wives, daughters and sisters of the present age, in furthering the mission of true humanity and ameliorating the condition of thousands who without their aid would be friendless and forsaken. Let the women of our land be encouraged and indorsed in their associated efforts. No matter about the title of their organizations. Leave that to them. The world is blessed, not by titles, insignia or symbols, but by actual results for good.

A FINE ODOR FOR ROOMS.—If you want a lovely odor in your rooms, break off branches of the Norway spruce and arrange them in a large jug well filled with water. In a few days tender, pale-green branches feather out, soft and cool to the touch, giving the delightful health-giving odor.

Factory Children.

At a musical entertainment given before the Alameda Nationalist Club at Tucker's hall, Friday evening, Aug. 22d, by Prof. James G. Clark, and richly enjoyed by an appreciative audience of ladies and gentlemen, DR. ARTHUR GORE read the following selected prose (by E. H. Sanborn, in *The Nationalist*,) and original verses:

Child Labor.

The woes of the mine-workers have been often told, but there has been hardly a word about the little toilers, and yet the blackest upon Pennsylvania's fair name, and upon that of Philadelphia, her greatest city, and the greatest textile center of the United States, is the slavery of the little toilers of the mills. An incident of the visit of the members of the Pan-American Congress to Philadelphia spread the knowledge of this disgrace to the world as nothing had ever done before.

In showing to the Pan-American visitors the extent of the city's industries, the committee of citizens conducted the guests through one of the great carpet-mills, where about 4500 operatives were employed.

This factory was presented as an exponent of Philadelphia's greatest industry, and as the largest establishment of its kind in the country. Instead of spacious, well-lighted and well-ventilated buildings, such as they had seen in some parts of New England, the visitors found a miscellaneous collection of tall buildings grouped together with no indication of system or of thought that the employes would have need of such elements as light and air.

But more appalling by far than this flagrant disregard of all the requirements of sanitation, was the presence of hundreds of little children in these dark, pestilential mills. It was not here and there a child, but the pale faces of the little toilers peered out of every corner and they gathered in groups to gaze at the visitors from the far South. Some of the Pan Americans patted the little ones on their heads and asked them how old they were, and from children who could not yet have seen ten years of life came the surprising response, "twelve years" or "thirteen years;" and as they left the foul air of the mills, the visitors said: "We have nothing like this in our countries, and we have not seen anything so

THE VESTALS TENDING THE SACRED FIRE IN THE TEMPLE OF VESTA IN ANCIENT ROME.

disgraceful anywhere else in the United States."

The Factory Children.

On the hill over yonder,
A city quiet lies,
Where men walk and ponder
Of far and fairer skies,
And con the legends o'er.
Head-boards roughly painted
Mark where each dweller dreams.
Little ones are sainted
The oftenest, it seems,
Among the hopeless poor.

Down below, the river
Flows surging slowly past;
Where factories roar and shiver,
And human lives are cast
In ceaseless, mad turmoil.
Down the hill, at daylight,
Go trooping little feet;
Up the hill, at gray-light,
Their weary task complete;
From late to early toil.

Little lives are budding
On sad and wasted stalks.
Little mounds are studding
The silent city's walks,
And only death is free.
Still the ceaseless trooping,
Till farther up the hill,
In a holier grouping
Their weary feet lie still,
And rest, O God! in Thee.

Still the wheels go humming,
The shuttles flutter swift,
Heart and brain benumbing,
And all is Mammon's gift,
The Juggernaut of gold.
Little lips are sobbing,
And parched like flowers in drouth;
Little hearts go throbbing
To fill the idol's mouth,
Midst horrors rarely told.

Oh! how can ye bear them
To be thus trodden down?
Oh! how can ye spare them,
The jewels of the crown?
Of man and womanhood.
Vilely mire bespattered,
And spurned by beastly heels,
Lie they marred and shattered
'Neath Mammon's chariot wheels.
Deprived of every good.

None to save and love them;
E'er toiling starved and low;
Merciless above them
There tramples sure and slow
The cloven hoof of greed.
Have ye eyes to see them?
And ne'er a heart to feel?
Spring ye up to free them!
Your welfare's in their weal!
Your woe is in their need!

Can we be called human?
Dare we God's image claim?
Comes there man or woman
To lift this baleful shame,
And let God's spirit in?
O men! be ye brothers!
Your little brothers see.
And, O women! mothers
To these your sisters be
And wipe away our sin.

Childhood guides the nation;
By it we rise or fall;
Till, by God's equation,
To judgment He shall call
And balance all arrears;
Or to higher being
Through childhood's loving care,
Faith shall change to seeing,
And we breathe Heaven's air
With joy too deep for tears.

Chaff

The wickedest man in Austin being questioned by a census enumerator about his infirmities, said he was suffering from clergymen's sore throat.—*Texas Siftings.*

McCarthy: Is McAdoo an Irishman, do ye think? O'Flanagan: He do be calling himself an Oirishman, and he have an Oirish name, but do yez know, I be thinking he be an impostor, for do yez moind his American brogue, I don't know?

Hyde: Mrs. Campaner is a clever housekeeper. She has a large family, and they are not rich, but she manages to husband her resources very cleverly. Barker: She has also managed to husband four of her seven daughters.—*Light.*

She: It will be a pleasure for me to share your troubles and anxieties. He: But I haven't any. She: Oh, you will have when we are married.—*Life.*

Cornell University has decided to give up its "School of Journalism." It is understood that its Chair of Base Ball will be retained.—*Norristown Herald.*

The large number of proposals of marriage made at the seashore is accounted for. The beach provides the young men with the necessary sand.—*New York Commercial.*

Deafness.—Dr. Dowling says that between the ages of 10 and 40 at least one person in three is subject to partial deafness. The great majority of cases of impaired hearing are hereditary, and are largely owing to a too close consanguinity of the parents. Deafness is more prevalent among males than females, owing to the fact that the male is more exposed to the vicissitudes of climate. There is much more deafness in America than in Europe, and this is due to a more general use of scientific instruments, such as telephones, where one ear is used to the exclusion of the other.

Young Folks' Column.

Mattie's Garden Party.

[Written for the Rural Press by Addie Archer.]

"Don't you wish, mother, we were rich enough to give parties and to get invited to some in return?"

Mattie Harwood had closed the book she was reading with a dissatisfied sigh, and looking dreamily out of the window, added "to go to Florida winters?"

"It would be nice, dear," answered her mother.

"We needn't have to be rich to have a party," said her brother Melville, who was placing a puzzle together on the floor. "I can get you up a s'prise party next week if you say so. Oh, I forgot, I mustn't tell you when it will be 'cause you are to be s'prised about it."

"You need not bother yourself one bit, Mell Harwood. I would not be guilty of having a horrid old surprise party where all bring their own cake and peanuts. It seems a very cheap way of entertaining one's friends, I say."

"It's better than not entertaining them any. I guess you are afraid of getting kissed, playing games with forfeits."

"I wouldn't play such a silly game; nobody does now but some poor things who don't know any of the nice new games. They are much more *stylish*, I think."

Mattie was two years older than her brother and liked to impress him with her superior ideas.

"Pooh, who cares for style? You're the proudest girl round."

"There, children, don't quarrel. You are both partly right and partly wrong. I have often thought that you need some lesson in receiving company of your very own, if only to invite a boy or girl in to tea."

"That's it, daughter; let them have a tea party."

They had thought grandpa asleep, for his head rested back in the easy-chair, and the paper slipped from his hand.

"Tea parties are for girls. I don't want any part in it."

"I don't think this house is fit for a party of any kind. It is too old and we haven't any china, silver or servants," said Mattie, glancing contemptuously around the big old fashioned sitting-room.

"Well, Mattie," said her mother decidedly, "you must make up your mind to be contented with what you cannot help and make the most of your situation. You will make yourself and every one around you unhappy by having too high ideas. Emerson, that grand philosopher, said: 'Don't hitch your wagon to a star.' Now, my dear, think not that because you cannot provide elegant entertainment you won't offer any. Simply do the best you can."

"That is right, daughter. Children nowadays get too many proud notions. They won't sing or play on the piano in company unless they can do it like a professor. No matter if every one coaxes them, it doesn't make any difference; but it isn't polite, I say."

"No, father, it isn't. I hope my children wouldn't do so."

"There," pouted Mattie, "I wish I hadn't said a word about a party. I wouldn't have one unless I could have it in style."

"Didn't I say she was proud! I guess her wagon is hitched to the highest and biggest star in the sky," said Mell.

"Hush, Mellie dear; I think Mattie will change her mind soon."

Mrs. Harwood sewed in silence for a few minutes, thinking of the best means of helping Mattie to overcome her false pride, and for both children to know how to receive some young friends; also, to learn that good breeding and happiness are not confined to wealthy ones, but are free gifts to all who will accept.

She waited until the evening lamps were lighted, the dishes washed, and Mattie had heard Melville recite his spelling lesson for the third time.

"Now we will talk some more about the party. I am very much interested in the subject, and think you will be, too, Mattie, when you hear it planned for you."

Mattie felt in better humor this evening, for her papa had brought a pearl pocket-knife home with him, telling Mattie that it was for his Sunbeam to use at school when she sharpened lead-pencils. So she gave him a loving kiss and then wound her arms about her mother's neck, saying: "I know it cannot help being nice if you have thought about it."

"Thank you, dear; but as you said, we haven't any silver."

"Don't say it, mamma. I'm sorry."

"I'll forgive you, but let us see what our resources are. What have we that few in town possess?"

"A cow?" asked Mattie.

"I know," answered Mell, "we have the best lawn of any one in this part of the town. I was picking currants one day last summer, and I saw two men driving by. They looked like rich old fellows too, and they were driving so slow I could most see their eyes wink. One of them said, 'That's the prettiest situation for a house I've seen in this village; that lawn and those trees are magnificent. Wonder they don't move that shanty of a house away and sell the lot to some one who can afford to put up a respectable residence.'"

At this they all laughed.

"Perhaps we will when some one is willing to pay what it is worth," said papa from behind the newspaper.

"We can have our party outdoors, that is what you mean, isn't it, mamma? Why didn't I think of it? A garden party it will be, and that sounds so stylish, too! Oh, can't we have paper napkins and some wooden plates?"

"Perhaps so; we will decide about it later. It will be a tea party outdoors, father," explained Mrs. Harwood, who liked to please grandpa by following his ideas whenever possible.

This was how Mattie's garden party happened to be planned, even if it was now windy March weather.

Never did the spring seem so long or the grass so slow about growing green to impatient Mattie, although the older members of the family predicted a forward season.

Mrs. Harwood planted flower-seeds in boxes, that the gardens might have an early start. Grandpa and Mell trimmed up the trees and shrubs. Papa brought home some red and green paint to touch up the *shanty* a bit. He could paint it himself after supper, when the days were lengthening.

"It will look like a summer cottage in the country, for I've seen them with sloping roofs like this," exclaimed Mattie as she watched her father apply the first brush of color to the dark boards.

It was decided to have the garden party the first week of the summer vacation. The invitations should be given to the members of Mattie's and Mell's class, including also some six or seven boys and girls in their immediate neighborhood; also allowing for chance visitors, the number would be about forty five, and no one could reasonably feel slighted. The notes of invitation had been carefully copied from a form found in her mother's magazine, and delivered by Mell.

Grandpa, who had always been "handy with tools," made three long tables which he said would be nice to lend when the church folks had a picnic.

"Now if we only had a piano or organ!" exclaimed Mattie the day before the party, as she was making lovely bouquets for the tables indoors and outdoors. "It seems as if we ought to have some music," she added, forgetting her resolve to be contented.

"That's so, dearie," piped a shrill voice which belonged to Miss Sallie Perkins, a little woman who lived alone. "I've hearn a good deal 'bout this garden party, an' come to offer my services. Your ma will have her hands full, I reckon. See here; how will this do for music? It will kinder liven things up a bit to set this agoing." Here Miss Sally quickly turned the crank and comically skipped around the room with her music box playing a lively tune. "Lor sakes! I should be dreadful lonesome if it wasn't for this. Why can't you ask Charley Day to bring over his cornet and play a tune for ye's? Lor sakes! You needn't be without music if ye haven't a piana."

"Thanks for the music-box; I am glad you thought of it and of Charley's cornet. I think he will oblige us. And O mother, we might have Mell drum occasionally for us!"

"I am glad you and Mattie have thought of something to add to the pleasure," said Mrs. Harwood. "I think a good drumming might give some animation in calling the tennis-players and when marching to the tables."

The next morning Mattie woke very early to see if any dreaded rain-drops lurked in the sky. She was happy to find the sun shining brightly, and peeped into the pantry on her way downstairs to see the tempting good things that could be prepared the previous day. There was yet a lot of work to do that forenoon, but Mattie had proved herself quite a help. Even Mellie had beaten eggs and creamed butter and sugar for cake. He was also to pound the ice and turn the freezer for the ice-cream.

"It's lucky for us that we own a cow and a dozen hens," said practical Mell.

"Yes, fortunate, too, that we have all outdoors to find decorations for the house," said mamma.

At the hour mentioned in the note of invitation, Mattie and Mellie stood at the garden-gate ready to receive their guests. Mamma was sitting on the bit of piazza, ready to give them the second word of greeting.

"Let's guess who the first one will be that comes," said Mellie.

"Lucy Jones, of course. She is a little lame, you know, and always starts in good season. Poor thing, I wonder what she will wear. I hope she has something decent."

"Hush, there she is now; and look down the street, there's a crowd of them. I'm glad they're all coming at once. I shall have this hat-lifting business soon over."

Mellie was at that age in every boy's life when any extra touch of politeness as raising his hat was a positive torture.

The boys and girls at once entered into the enjoyment of the afternoon, some selecting swings, hammocks or croquet mallets.

Mattie, who had dreaded some awkward moments at first, felt greatly relieved. She did her best to make all have a good time and see that none missed a share in the games. To Lucy she was especially kind, for she remembered that only a very few bothered to say much to shy, retiring Lucy Jones.

Lucy, as a result of Mattie's kindness, had one of the happiest days of her life, and she certainly never before looked so pretty, even though her new dress was, as she confided to Mattie, only a five-cent print. But a happy heart always makes one's face more attractive.

At six o'clock the tables were ready, and very tempting they looked to the forty-six hungry children, whose healthful games in the pure air had given excellent appetite.

To Mattie's surprise, there were several things on the tables that she had not heard planned in the *menu*. But a few kind neighbors had insisted on sending something that would help Mrs. Harwood "feed that troop of hungry children, as they could never undertake such a task alone." Then grandpa, like others bearing that dear name, wanted to do his part, and quietly ordered a quantity of fruit and bonbons from the city.

"I'm glad we thought to have a garden party, mamma," said Mattie after the last one had gone. "I mean to have another next year. Don't you, Mellie?"

"Of course I shall, I mean we shall if mother will let us."

"I hope we will, dears," said Mrs. Harwood, never once hinting how very tired she was.

Domestic Economy

Roll Jelly Cake.—Three eggs, one-half cup of white sugar, 1½ teaspoonfuls of baking powder sifted twice with one level cup of sifted flour; bake in a moderately heated oven.

Apple Fritters.—Make a batter of one pint of milk, two eggs and flour enough not to make too stiff; add four tart apples chopped fine; put in lard, and serve with powdered sugar sprinkled over them.

Cake Without Eggs.—Two-thirds cup each of sugar, water and milk, two cups of flour, two teaspoonfuls of baking powder, one-third cup of butter, flavor to taste. This is excellent for layer cake.

Ginger Snaps.—Two eggs, two cups sugar, one cup butter, two teaspoonfuls ginger, one teaspoonful cinnamon, flour to make a stiff dough. Roll into a thin sheet, cut into rounds, and sprinkle with granulated sugar before baking. Watch closely, or they will burn.

Smothered Beef.—Have chopped fine one pound of lean beef, put a tablespoonful of butter in your chafing-dish, when hot put in the beef, and stir constantly for about two minutes, dust with salt and pepper, and serve at once. This, if prepared nicely and served very hot, is both delicious and wholesome.

Delicate Biscuit.—One quart of sweet milk, two teaspoonfuls of baking powder, half a cupful of best butter, one teaspoonful of sugar, and flour to make a soft dough. Roll out half an inch thick, and cut out tiny biscuits with a small baking-powder can. Bake in a very hot oven.

Foamy Sauce.—Beat the yolks of two eggs and one cupful of powdered sugar well together and set the bowl into boiling water and stir until quite hot, then add the whites beaten stiff; add a small piece of butter and a tablespoonful of brandy or extract after taking from the stove and serve immediately.

Scalloped Cod.—Two cupfuls picked codfish, one cupful drawn butter, with an egg beaten in it, one teaspoonful minced sour pickle, one tablespoonful Worcestershire sauce, fine breadcrumbs. Have the drawn butter hot, stir the fish into it, add the pickle and sauce, pour into a buttered baking dish, sprinkle with crumbs, dot with bits of butter, and bake.

Whipped Cream Sauce.—Set one cupful of cream on the ice for two hours before using, beat or whip it until it will stand alone, return to the refrigerator while you beat the whites of three eggs to a froth, add three tablespoonfuls of sugar, then the whipped cream and flavor to taste. Nice with the fruit pudding above, blanc mange, or nearly any sweet pudding.

Raspberry Shortcake.—Rub three tablespoonfuls of butter or lard into a quart of flour sifted with three teaspoonfuls of baking powder, until it is fine, then add milk until it is as soft as it can be rolled out. Roll it about half an inch thick, and bake. Invert the bottom of the cake for the layer of berries. Pile them on about an inch thick, with bits of butter, dredge with sugar, and put on them another crust, made and baked like the first. When cut for serving, pour over each piece sweet cream or whipped cream; or, in place of it, use a sauce made by creaming together three times as much sugar as butter, then adding an egg, white and yolk beaten stiff, and then stirring in slowly half a cupful of rich milk.

The Human Toe and Mouth.—In the anatomical institute at Strasburg, it has been found that the small toe of the human race is retrograding and losing one of its joints. Among 50 small toes dissected, 14 had two joints instead of three. The Springfield *Union*, under the head of "Will the mouth ever bite the ear?" says: A Frenchman has discovered that the human mouth is gradually working its way around toward the left ear, and accounts for it by the invariable tendency of men to eat chiefly with the teeth on the left side of the mouth. This wears out the teeth on that side and gives the jaw a cant toward the left. In the course of a few ages it is believed that the mouth will approach the left ear, and there is some danger, if the process keeps on long enough, that it may get around to the back of the neck.

The Week.

The current week in city circles is largely one of expectancy and preparation. We are on the eve of another of the great events in the history of San Francisco; an event in which all parts of the State will participate, thus making more apparent its broad significance. It will be 40 years on Tuesday next since California attained her Statehood in the Union, and the Native Sons of the Golden West propose to make the 40th birthday of the State memorable.

The celebration will cover four days and will open with a torch-light parade on Saturday evening, September 6th. On Monday there will be a regatta for all sorts of water craft, and on Monday afternoon the welcoming exercises, literary and musical, in the Grand opera-house. On Monday evening there will be a grand entertainment and reception in the Mechanics' pavilion. Tuesday will be the great day of the celebration, and a grand parade, in which it is expected 20,000 will take part, will move up Market street at 10 A. M. Most elaborate preparations have been made to render this parade gorgeous and significant.

On Wednesday there will be an excursion around the bay, which will close the exercises. According to the Governor's proclamation, Monday and Tuesday, Sept. 8th and 9th, are public holidays.

The city is gaily decorated and there is a general disposition to participate in the festivities, which will no doubt deeply stir the patriotic heart.

A Hint from Hungary.

The London *News* has a letter from Vienna, telling how a farmer's wife, in the Hungarian village of Moor, was ironing in her kitchen, when a spark flew out and set fire to her muslin dress. In her fright she ran into the yard, where her husband and his people were thrashing. The barley caught fire from her, and the wind blew the sparks in all directions, setting fire to the thatched roofs of the houses which formed the village street. All was so sudden and the people were so dumfounded that at first they could not even call for help. Most of the heads of families were in the vineyards, and their aid was not available until recalled by the alarm bell. The old people and children in the houses had not presence of mind enough to save themselves.

It had not rained for a long time, and the wells contained no water, so that nothing could be done to stay the spreading of the flames. In all, 109 houses were destroyed and 134 families left without a roof above their heads. The harvest was over and the corn in the barns was consumed in the general conflagration. At last accounts 10 bodies had been found, and nearly everybody in the neighborhood was suffering from burns received in rescue work.

This sad story has in it a timely warning for us Californians. Grass, fallen leaves and outdoor trash in general are now dry and inflammable as tinder; and, until the autumnal rains commence in earnest, the least carelessness about dropping a match or a cigar-stump, throwing out embers or leaving an unquenched camp-fire—not to speak of kindling a brush-heap—is liable to result in such raging and wide-spread conflagrations as have too often laid waste our fields and woodlands, and destroyed barns, implements and homes.

In this connection, the following circular from the Commissioner of the General Land Office will bear repeating:

The attention of the public is called to the fact that large quantities of timber are annually destroyed by forest fires, which in many cases originated through the carelessness of hunting, prospecting and other camping parties, while in some instances they may occur through design. I take this method of warning all persons that hereafter the cause and the origin of all summer fires will be closely investigated, and where the fire is ascertained to have originated through carelessness or design, the parties implicated will be prosecuted to the full extent of the law. Special timber agents are hereby directed to proceed against the offenders under the local laws of the States and Territories, relating to the unlawful setting out of fires, in which the same may occur. The public generally are requested to aid the officers of the Government in efforts to check the evil referred to and the punishment of all offenders.

It is an old, old story, whereof both we and long-time readers alike are weary; yet the sermon must needs be preached again each recurring season: Beware of sparks! Behold how great a matter a little fire kindleth!

THE Society of California Pioneers object to the proposition of the Regents of the University to remove the remains of James Lick from their resting-place beneath the pier of the great observatory on Mount Hamilton.

The State Fair.

Next Monday the State Fair will open in Sacramento. Indications are that the exhibition will be notably fine and well patronized. Secretary Smith announces a greater number of exhibitors than usual and greater effort to display material in pleasing ways. The floor of the pavilion will show several unique structures for exhibition purposes. County exhibits will also be features of the exhibition, although some of those which have in years past secured first prizes are not expected to compete, as counties, this year. What is lost in this way, however, will be more than made up by an increased number of individual exhibits of agricultural, horticultural and other products. The art and decorative features of the pavilion exhibit will be many and varied, and the music especially during the last week of the fair will be notably fine.

The outdoor branches of the fair will contain novel features. The applications for stall-room already number upward of 1000, which insures an aggregation of horses and cattle that, in point of numbers, would do credit to any State. To meet the demands of the exhibitors, more accommodations have had to be provided, including a new building with 48 stalls for fine cattle. The yearly increase in entries of live-stock for exhibition and competition for the liberal premiums offered by the society, convince the Directors that the space and accommodations at their command will soon have to be materially enlarged. Even now, there would be more live-stock shown if there were accommodations for them.

More attention has been paid this year to the matter of outside attractions than heretofore. Beginning on Friday of the first week, there will be special attractions of some sort at the Park on each morning during the remainder of the fair. The State Fair program, which we publish on another page, indicates the nature of these exercises.

There is every prospect that the races this year will exceed in interest those of any preceding fair. The entries are more numerous than ever before, and the district races are developing young trotters and runners of unusual merit. Many young horses that went into the circuit at the opening of the season, without reputations, are likely to trot in less than 2:20 at the State Fair races.

There will be the usual throng of people bent on amusement, with a grain of instruction thrown in, and the occasion is one likely to well repay all who have means and leisure for its enjoyment.

Government Irrigation Work.

Reports in Washington correspondence bring more definite information concerning the outcome of the issue between different groups of Congressmen on the provisions for Government irrigation and the character of the work. The statement is that "the conferees on the Sundry Civil Appropriation bill have at last come to an agreement on the bothersome survey and irrigation question." The result is a complete victory for the Senate, its action in striking out the irrigation appropriation of $720,000 having been fully sustained. What the irrigation survey loses, the topographic survey partially gains, the allowance for this branch of Major Powell's work having been increased from $200,000 in the House bill to $300,000 in the Senate's amendment and to $325,000 in the conference report. The amount voted by the Senate for the public-land survey is reduced from $600,000 to $425,000. The House originally gave only $200,000. A compromise is also effected as to the land-entry question. The legislation of 1888, withdrawing from sale lands west of the 100th meridian, has been so modified that all entries made in good faith up to the time of the passage of this Act have been validated, except entries on reservoir sites which have been selected. The reservoir sites which have been selected are reserved, as under the law of 1888; and the reservoir sites hereafter to be selected are reserved from the date of their selection. In the future, whenever public lands are occupied by claimants with a view to obtaining title, the claimant can obtain title from the Government, under all the land laws, to only 320 acres.

The report of the Conference Committee was agreed to by the House and probably marks out the future course of events. It can be considered under the circumstances as fairly progressive and much can be accomplished. It will, we hope, result in a better knowledge throughout the country of the needs of the West in the direction of irrigation, and thus prepare the way for future undertakings. It is also encouraging to know that the great progress being made in irrigation will be brought out by the new census, as the "number of acres irrigated," and "number of artesian wells," were among the questions on the general agricultural schedule carried by all the enumerators. Before the life-giving waters of irrigation "the great American desert," which occupied so large a place on the maps 30 or 40 years ago, is disappearing, and truly the wilderness is coming to "blossom as the rose."

Raffia.

We have received from our old horticultural friend, Thomas Meehan of Germantown, Pa., a sample of the raffia which he is now sending to plant and tree propagators as a material for tying buds and to horticulturists generally for all ties except perhaps the matrimonial. For such ties it probably would not be more divorce-proof than the bonds now in use. The sample we receive shows that it is admirable for nursery and garden use. It is extremely tough and even a shred of it is quite strong. Mr. Meehan writes:

We are using it in our nursery here for every purpose that we ever used "bass" for and find it superior in every way. Our foreman was a little slow in using it, but he now says that he would use nothing else. That slippery feeling which it has is a benefit in several ways; one and the greatest is that it prevents a bunch of it from getting knotted and tangled. Every one who ever used "bass" will see in a moment that that alone will commend it to nurserymen. For use in tying up plants we find it better than string, and we notice that several large firms who deal largely in greenhouse plants use it entirely for tying paper around their plants when preparing them for mailing.

It is interesting to note how many ties can be made from a small bundle of raffia. Taking a roll of a trifle more than three-fourths of a pound, we find that it contains about 375 pieces averaging five feet long. Each piece can be cut into four lengths, which we find of ample size for all uses, and the four lengths can again be split ten times. Taking 375 pieces, in a little over three-fourths of a pound, it would yield enough to tie 3750 buds or grafts, at a cost of less than 25 cents.

It would be interesting to have a little discussion on tying material by our nurserymen and amateur propagators. We will welcome any statement based upon experience, and we can assure contributors that such statements will be eagerly read.

The Orange Industry.

B. M. Lelong, Secretary of the State Board of Horticulture, during a recent visit to the south, was interviewed by a reporter of the Los Angeles *Herald* and undertook to set himself right in an interview with him by a San Francisco reporter on the amount of oranges shipped from the State, in which he had been incorrectly reported as having said that 3400 cars of oranges had been shipped during 1890. The facts, he says, were these: A reporter sought to interview him upon the orange production, and he being in haste to take a train, told him that the production of the State was about 3200 or 3400 cars, valued at about $2,000,000. Of these, about 2600 were shipped and the balance were consumed at home. The reporter made a botch of the statement.

In speaking of orange-growing and prospects for the future, Mr. Lelong said that the markets for California fruit were never better, although the orange crop of the State will be somewhat smaller than it was at first estimated, but it will be of excellent quality. In answer to the question about orange-growing in Sonora (Mexico) he said that while considerable had been done of late, orange-growing had received a setback there owing to the defective titles to the lands and the scarcity of water to irrigate. Of the orchards planted in the northern part of the State, Mr. Lelong stated that the experiment so far had proved a decided success, that the orchards planted in the past two years had experienced the coldest of winters ever experienced in California, and that notwithstanding all this they have made splendid growth. In Butte county there are about 3000 acres planted to citrus fruits, and all are doing well. In Yuba county an orange-grove planted two years ago, of 12,200 trees, is doing well.

YOUNG COMET, AN ALL-PURPOSE HORSE, OWNED BY J. C. BOWDEN, STOCKTON, CAL.

Young Comet.

We have shown many horses of thoroughbred or standard trotting status, and many others of imported breeds of carriage or draft fame, but few of the all-purpose class, developed with care from good foundation blood with the idea of meeting general uses. We give on this page a portrait of an excellent animal of this class, one in which his owner takes justifiable pride, and one who is leaving his mark upon the horse-stock in his region. The horse is Young Comet, owned by J. C. Bowden of Stockton. He was four years old April 27 last. His weight is 1200 pounds; color, almost black; he has a fine form and good action, kind disposition, and it is claimed that with training he will show 2:35 or 2:40 speed. Young Comet has been awarded two premiums at the San Joaquin Valley District Fair for an all-purpose horse.

Young Comet was sired by Smith Acker's Comet of Oakdale, Cal.; he by Old Comet of Iowa; he by a pacing-horse owned by a Mr. Williams; he by Rattler; he by Bigert's Rattler of Orange county, N. Y.

Comet's dam was Black Bets; her dam Morgan and Kentucky Whip; her sire was Iowa Chief; he by Hill's Black Hawk, half-brother to Ethan Allen.

Acker's Comet was never driven in a race, but could show a 2:35 gait, and was one of the best all-purpose horses in the State, and his colts are all stylish and good roadsters, some of them going in 2:35.

Young Comet's first dam was by L. U. Shippee's Henry Clay; he by Dave Hill; he by Black Lyon; he by Vermont Blackhawk. His second dam was by Black Weazel; Weazel's dam was Messenger and Duroc by American Eclipse.

Young Comet's third dam was a Bertrand mare raised in Knox county, Ill., and driven across the plains by Mr. Bowden in 1860.

There are in the neighborhood of Stockton ten three-year colts by Young Comet, and they are claimed to show as well as the colts of any horse in the county.

State Fair Program.

Monday evening, Sept. 8: Pavilion opens and remains open until close of the fair, Saturday evening, Sept. 20. Hours of exhibition, 9 A. M. to 5 P. M. and 7 to 11 P. M.

Thursday, Sept. 11: Display of livestock at the park opens. Racing begins at 1 P. M. and continues each afternoon until Sept. 20.

Friday, Sept. 12: First ladies' equestrian tournament, at 10 A. M.

Saturday, Sept. 13: First livestock parade.

Monday, Sept. 15: Vaquero exhibition at 9 A. M. Livestock judges begin work and continue until Thursday. Signor Liberati's evening concerts begin in pavilion and continue during the week.

Tuesday, Sept. 16: Second livestock parade.

Wednesday, Sept. 17: Amateur athletic tournament at 9 A. M.

Thursday, Sept. 18: Third livestock parade at 9 A. M.

Friday, Sept. 19: Second ladies' equestrian tournament. Gold medals awarded.

Saturday, Sept. 20: Final stock parade; only prize-winners appearing. Premiums paid at 10 A. M. Fair closes.

THE VETERINARIAN.

Sore Mouth, Ringworm, Lameness.

Sore Mouth.

EDITORS PRESS:—I have a horse which is continually frothing at the mouth, and does not eat his grain and hay well. What must I do for him? I had him examined by a quack veterinary, and he gave him something, but did not do him any good. —B. A., *Antioch, Cal.*

The molar teeth (grinders) of a horse wear beveling, the upper rows stand down and out; the lower rows stand up and in, and they are so arranged that they never get dull like an old mill-stone, but get sharper and sharper the more they wear, so that the grinding surfaces are always in a good, sharp grinding condition. But on account of the beveled form of the surface, the edges must naturally get sharp, which they do so often as to almost prevent mastication by cutting the cheeks and tongue. The treatment is obvious. Have the edges of both upper and lower rows filed off, so as to make them round and smooth instead of sharp, like a saw; *but never touch the grinding surface*, which is so often done by these so-called veterinary dentists.

Ringworm.

EDITORS PRESS:—Will Dr. Buzard please give me the definition and nature of ringworm in cattle? —G. L. D., *Santa Maria, Cal.*

Ringworm (*tinea tonsurans*) is an affection implicating the hairs, the hair-sheaths and cells of the epidermis (cuticle or scarf-skin) in different parts of the body, usually assuming a circular form. The hair becomes brittle and dry, having a tendency to crack or break across. Itching accompanies the primary eruption.

The nature of this disease is closely connected with the life and development of the peculiar fungus which is associated with it. This parasitic fungus (*achorion vel tricophyton tonsurans*) apparently develops between the epidermis and true skin, and invades the interior of the root and shaft of the hair. This fungus is of a white or light-gray color. The cause of this disease is the implantation of the spores of the fungus into the hair follicle, and under certain conditions, such as youth, dampness and darkness, tend to favor the growth of the seed.

The treatment of ringworm must consist in first destroying the parasites; if this can be done, the disease is cured; and, secondly, we must render the soil in which they grow less fitted for their implantation and development. First of all it is necessary to remove the scales by soaking and washing with soapy mixtures, following this with a moderate painting of the compound tincture of iodine, or a solution of the bichloride of mercury, or the ointment of the biniodide of mercury. Sir William Jenner recommends as a parasiticide sulphurous acid, diluted with equal parts of glycerine, or with two parts of water.

Lameness.

EDITORS PRESS:—I have a fine gray horse that strained the leaders in his left hind leg. I blistered his leg several times and turned him out to pasture, but he does not seem to improve. Please tell me what to do for him through your veterinary column, and oblige—A HORSEMAN.

The most important part of the treatment of lameness is to locate it beyond a doubt. It may be that there is another injury besides the one you have been blistering. If the lameness does not lie in the tendons, the blistering is lost time and much useless suffering is imposed upon the horse. If it is a bad case of sprained tendons, and will not yield to rest and repeated blistering, you will have to have him fired and blistered, and give a long rest. I would advise you to employ a competent veterinary surgeon to perform the operation.

A. E BUZARD, M. R. C. V. S. L.
11 Seventh St., S. F.

AGRICULTURAL NOTES.

CALIFORNIA.

Alameda.

ROUNDING UP HARES.—Haywards *Journal*, Aug. 30: D. S. Smalley has a greyhound that is the champion jack-rabbit catcher in this section. Hardly a day passes but that he runs down one or more hares, and we frequently see him trotting along the depot road with a victim. He invariably brings it home, and will allow no one to take it but one of the family.

Butte.

GROWING POTATOES.—Oroville *Mercury*, Aug. 29: On the Oayett ranch, below town, 1800 sacks of Irish potatoes have been gathered and sold this summer. S. B. Oayett says they were excellent in quality, and the company realized an average of $1.50 per hundred. These potatoes were grown between the rows of fruit trees in a 30-acre orchard. Thus the land was made to pay from the start, and that is the way to farm.

HORSES POISONED.—During the past month several horses pastured on the slough below Yuba City have been taken sick with a peculiar malady, and in a few days have died. The animals have been examined after death, and it is thought that they were poisoned by eating some kind of weed that grew in the slough. Most of the farmers have taken their stock from the pasture in consequence of the above circumstance.

GOOD SUGGESTIONS.—Gridley *Herald*, Aug. 21: We hold that every producer, as well as every taxpayer, in the county ought to feel a personal interest in fair exhibition and do everything in his power to insure a thorough and complete display of every product of the county, either vegetable, mineral or manufactures, and also endeavor to have his neighbors and sojourners in the county attend. There is not a township in the county from which cannot be sent an exhibition worthy of space—there is not one that should not do so.

Colusa.

APRIL BARLEY.—*Sun*, Aug. 30: Some years ago H. C. Stanton, while walking over a field of young barley, noticed a stalk that was already ripe unto the harvest while the vast field was yet in its infancy, so to speak. "A bonanza," thought Mr. Stanton, and he plucked the ripened head and walked the whole field over and was rewarded by finding ten stalks in all. These he carefully preserved for seed and has each year planted and harvested it, until this season his crop reached 2000 sacks.

Contra Costa.

GOOD PRICES.—Martinez *Gazette*, Aug. 27: We learn that a large portion of the Muscat and Tokay grapes produced in Alhambra valley this year are already contracted for. The Martinez Canning Company takes about half the crop of John Swett, the other half being previously contracted for to other parties. This company also takes the Muscat and Tokay grapes from the vineyards of Dr. Strentzel, John Muir and H. Raap. The price paid for Muscats is $30, and for Tokays $50 per ton.

SAND LAND FOR FRUITS.—Antioch *Ledger*, Aug. 30: G. J. Turton, a fruit grower of Napa, has recently purchased a tract of the chaparral or sand land east of Antioch. He is of the opinion that there is no better fruit land in the State, and inasmuch as he is a practical and experienced fruit-raiser, his opinion carries some weight.

El Dorado.

FRUIT-GROWERS ORGANIZING.—Placerville *Democrat*, Aug. 30: The fruit-growers of the Granite Hill and Coloma fruit belt have become tired of endeavoring to secure some person of means to erect a fruit-house at Placerville, and have taken hold of the matter themselves and will organize a joint-stock company for that purpose.

Fresno.

CREAMERY.—Fresno, Aug. 28: The first creamery ever erected in Fresno county has just been placed in operation in the Liberty settlement. It is owned and conducted by A. T. Johns, who has spared neither pains nor expense to make it equal to any in the State.

BIG CROP OF RAISINS.—Fresno *Expositor*, Aug. 28: The largest first crop of raisin grapes ever grown in Fresno county or in California can now be seen by driving through A. B. Butler's vineyard. The crop is being cured under the management of R. R. Paulini. Mr. Paulini was born and raised in the grape-growing section of Italy. He is thoroughly acquainted with the raisin industry.

Lassen.

A BIG DRIVE OF SHEEP.—Susanville *Advocate*, Aug. 30: Within two or three days there has been driven past Susanville, through the hills to the south and west of town, a band of 13,000 mutton sheep, destined for the Stockton market. These sheep were purchased in Oregon by the Bauch Bros., and are to make their way by easy drives through the mountains, where feed and water may be had, to the nearest point before a descent is made to the valley. Their route will probably be by way of Lone Rock into Sierra valley, and on into the vicinity of Truckee.

Los Angeles.

OLIVES.—Pomona *Progress*, Aug. 28: While the orange is profitable, the apricot and peach quick growers, the apple hardy, the cherry a splendid bearer, the almond easy to raise and a safe tree to plant, yet to a great extent the olive combines the most excellent qualities of all these trees. It is so hardy that it can be planted up to an altitude of 3000 feet, it is so profitable that it excels any other tree we have named, and while it is as easy to raise as the almond or the fig, it yet has other properties which none of these possess. Its fruit, whether pickled or made into oil, is a staple production. It can be kept for an indefinite period. It is a condensed product, easy to transport and costing but a small sum for freight, there is no danger of loss by overproduction, it needs but little irrigation, will thrive on rocky lands, and is a long-lived tree that every poor man should set out in preference to almost any other.

PRUNE PLANTING.—Pomona, Aug. 28: It is remarkable how many prune trees are being bought in Pomona now. Fruit trees have very seldom had any sale at all in this region at this season of the year.

POTATO YIELD.—Pomona, Aug. 28: About 400 acres have been planted to potatoes at North Cucamonga this year. The average yield per acre is about 100 sacks of 100 pounds each.

DRIED PRUNES.—Pomona, Aug. 28: Nearly all the dried prunes of this valley have been sold under contract at $200 a ton, and the same is true of dried peaches at prices ranging from $360 to $400 a ton.

CALIFORNIA'S OPPORTUNITY.—L. A. *Mirror*, Aug. 29: Few persons not engaged in the handling of produce have any idea of the large amount of money which is coming into Southern California this year, not only for fruits but also for vegetables. A produce jobber of this city informs us that Los Angeles, far from importing potatoes as we did in such quantities a short time ago, is now shipping east to Texas, Colorado, New Mexico and Arkansas, while inquiries have come from as far off as Memphis. We have also been shipping cabbages as far as Kansas City. Prices are stiff all along the line for these products.

Mendocino.

HOPS.—Ukiah *Dispatch and Democrat*, Aug. 29: M. Newfield was offering 32½ cents for hops last Tuesday. J. E. Holliday sold a small portion of his hops last Monday for 31 cents per pound. The hop crop in Ukiah valley this year will average between 1300 and 1400 pounds to the acre.

Monterey.

GRAIN CROP.—Salinas *Index*, Aug. 28: The crop of grain that will go into warehouse from the neighborhood of Castroville this year will be only about half of what it has been in former years, and the volume will never be as great as it once was. The diversion of the Molera tract to sugar beets has made quite a hole in the grain output, and much of the mesa land east of Castroville has been devoted to dairy farming, and former grain-fields in San Miguel canyon have gone into orchards, so that the people about Castroville have learned, what people in other parts of the county can profitably learn, that there is something besides wheat and barley for farmers to put their trust in.

POTATOES.—Salinas, Aug. 28: The potato crop raised about Castroville this year is very fine, of excellent quality and of good yield, and brings a fair price.

SUGAR BEET.—Salinas, Aug. 28: The sugar-beet farm, viewed from the streets of Castroville, looks like a sea of green, and it is stated that the work of harvesting will commence about Sept. 10th. Notwithstanding the obstacles of water-soaked and foul ground in the planting season, it is estimated that two-thirds of a crop will be harvested this year, and the ground will be in prime condition for the next season's crop.

Napa.

GRAPE PRICES.—St. Helena *Star*, Aug. 29: C. Carpy of Napa is paying for Malvoise $12, Zinfandel $15, and Burgundy $17. The fact that there is a great scarcity of wine grapes can be no longer denied, and we have no doubt that the prices will go still higher.

Nevada.

PEAR SHIPMENTS.—Grass Valley *Tidings*, Aug. 29: Twelve hundred boxes of pears were shipped from Grass Valley on Tuesday, and between 300 and 400 boxes to-day. Large shipments will be made for the next two weeks, a heavy yield being reported. Something like 5000 boxes will be shipped from Nevada City, where, it is stated, a single tree netted the owner $15.

Orange.

PAYING UP MORTGAGES.—Ontario *Record*, Aug. 27: We learn of a number of fruit-growers in Ontario who will pay up mortgages on their places of from $1000 to $2000 from this year's fruit crop, thus putting themselves out of debt, with a good income assured for the future.

GRAIN THEFTS.—Anaheim *Gazette*, Aug. 28: Grain thefts have been frequent in the valley this season. One farmer, we are informed, has lost 1500 sacks of grain.

Sacramento.

REPAIRING CANAL.—*Bee*, Aug. 28: The Supervisors and City Trustees returned last evening from an inspection of the drainage canal. The canal was found to be in a wretched condition, and, in what is known as the "Pocket," considerable land is still inundated with stagnant water, caused by the overflow from the canal last winter. Col. McNasser informed the party that at least 6000 acres of as fine land as there is in the State has been rendered useless because of the condition of the canal. It seemed to be the general opinion of those making the investigation that the canal should be deepened and widened and extended all the way to Snodgrass Slough.

San Diego.

BIG MELONS.—*San Diegan*, Aug. 30: Knapp Brothers this morning received in their consignment of fruit a nutmeg cantaloupe weighing 20 pounds. The melon was grown by a Mr. Brown on the high lands at Chula Vista, and is besides being one of the largest specimens of that variety ever seen, a perfect melon in every respect. It was a theory that melons would only do well on low and naturally moist ground, but the largest and best melons brought to the San Diego market this year have come from high, irrigated lands.

DRYING PRUNES.—San Diego *Union*, Aug. 28: G. H. Bower is drying a large crop from 500 Petite d'Agen prune trees. This is his third year of drying, and the prunes are a fine sight spread on raisin trays in long purple rows down the edge of the orchard. He shakes the fruit from the trees once a week for three weeks, after which he gathers the balance the fourth week. Into 20 gallons of water, to which has been added one pound of concentrated lye, he dips the fruit 20 pounds at a time in galvanized buckets perforated for the purpose. The dipping of each lot requires but about 30 seconds, and it is then dipped in clear cold water to rinse off the lye. It is next spread on trays laid directly on the ground. If the weather is hot, a few days will cure it sufficiently. It is afterward taken up and dipped, in the same bucket, into clear, boiling water, in order that all dust may be removed and any eggs killed which may have been deposited. Exposed in the hot sun and breeze, on trays elevated some three feet above the ground, it will be ready in from 20 minutes to half an hour to box and sack for market.

Santa Barbara.

EDITORS PRESS:—Our warm spell has now a little check, as there is some fog to break the rays of the sun. Although it has been hot and dry, the temperature has not been above 95 degrees in the shade. Lima beans have ripened very fast of late, and some few growers have begun to cut them. The excitement about the gas continues, with so many gassy statements that it is not easy to get at the truth concerning the amount, etc. A pipe running up 25 feet or more above the well, makes a brilliant torch to light Summerland and vicinity.—O. N. CADWELL, *Carpinteria, Aug. 24, '90.*

LARGE PEARS.—Lompoc *Record*, Aug. 25: The finest Bartlett pears we have ever seen are grown in this vicinity this season. It is nothing strange to find pears weighing 1½ pounds. The great need of this county now is a cannery at which can be put up the vast quantity of fruit this region is capable of producing. What is the use of resting on our oars when the land is here to grow 10,000 acres of fruit and ought to be growing it?

Santa Clara.

FRUIT DRIERS SHUTTING DOWN.—San Jose *Times*, Aug. 29: Many of the fruit-driers on the outskirts of Santa Clara have shut down for the season, as the high prices of fruit and the crowded markets have compelled the owners to close.

Solano.

PREPARING FOR HIGH WATER.—Vacaville *Reporter*, Aug. 28: Some farmers have gathered a little wisdom from the past season's experience and propose to profit by it. They have observed that grain was drowned out and trees died where they might have gathered harvest and plucked fruit if they had prepared for the worst. Some of them had taken care to furrow drain and saw its benefit. This year they will improve in drainage. Wellington Cripps is ditching his orchard, and with a drain between each row of trees emptying into the ditch, he will be able to carry off surplus surface water and save his trees. Every orchardman can easily use preventive care and save the destruction of a year's work. W. H. Fry has been employing himself in drainage work. He has given more attention to it than others and proposes to make more ditches than ever. He has a complete drain of his orchard on the old Cooper tract, and has ditched to carry the water out of the field into the road. He has thrown up a road from the lane into his orchard and made a ditch alongside of this road.

SUMMER FALLOWING.—*Reporter*, Aug. 28: The farmers are all wishing they had their places summer-fallowed. The long, wet spring kept them from much summer-fallow plowing. The haying and summer-fallowing came together. Lewis March summer-fallowed most of his field northwest of town after the hay was stacked. Some of them got ground prepared for sowing early this fall. D. F. Parker has about 320 acres, J. McCrory 280, W. H. Fry 135, W. Cripps 40, and W. P. Owens 60.

Sonoma

HOP FREIGHTS.—Santa Rosa *Republican*, Aug. 28: Captain Guy E. Grosse, president of the Sonoma County Hop-Growers' Association, has received a letter from G. W. Fletcher, commercial agent of the Sunset route, the purport of which is that lower rates on through lines to New York and London have been secured for the hop-growers of Sonoma county. The letter was read to some of the growers, to whom it proved satisfactory and who decided to make up several carloads of hops for early shipment. By the reduced rates it is possible to ship the hops to London and have them sold at an expense of less than five cents per pound.

BIG SUNFLOWER.—Cloverdale *Reveille*, Aug. 30: The Santa Rosa papers have been publishing reports of large sunflowers growing at that place. From S. Pinschower we learn of a sunflower grown on his place that beats the record and defies competition of the State. The stalk is six inches in diameter and stands 12 feet high. The flower is as big as the sun and measures nine feet in circumference, and at a distance it is difficult to distinguish the one from the other; at least so says Mr. Pinschower. Any one doubting the above is invited to go and see the sunflower himself, and he will be allowed to bring his own 100-foot tapeline to take measurement.

FRUIT-DRIERS.—Sonoma *Index-Tribune*, Aug. 29: Henry Weyl of this place has entered into a copartnership with Messrs. Cassidy of Petaluma, with the result that four driers will immediately be erected in the vicinity of the railroad depot. The furnaces will arrive from San Francisco to-day, and the work of erecting the driers will be commenced immediately. A large quantity of apples which have already been purchased in this valley will be handled first. The starting of this enterprise is but the forerunner of what may turn out to be one of the largest canning and fruit-drying establishments in the State.

Stanislaus.

CROP ESTIMATES.—Oakdale *Leader*, Aug. 29: The reports as given by thrashing men who have recently hauled off their machines for the season would indicate that the receipts of wheat at this point this season will fall far below those of last year—perhaps one-half short. Frank Fagan, who has been extensively engaged in thrashing the grain crops in this section for a number of years, reports that the acreage sown this season was nearly one-half short of last year's crop, and the yield per acre is not quite up to that of last season. J. W. Anderson, who closed the season's thrashing last week, made a statement to a reporter which does not differ materially from that of Mr. Fagan's more than that he expressed the opinion that the yield per acre would be equal to that of last year. The greatest falling off he found was on Upper Dry creek, where but a small portion of the lands was seeded. In that locality the same area which required seven weeks' thrashing last year consumed but five days' time this season. Mr. Anderson reports the yield of barley light—not more than a one-third yield in localities where his machine operated. These gentlemen have had long experience in handling the grain crops in this section, which entitles their opinions to consideration. These reports apply largely to adobe lands.

Sutter.

SORGHUM FOR FEED.—*Farmer*, Aug. 26: C. H. Pease, a few miles west of town, has been experimenting in planting early amber sorghum, and pronounces it the best green feed for stock during the summer of any variety of corn he has ever tried. When planted in the spring it makes a quick growth, and as it is cut or fed off, suckers spring up from the roots, making good feed until late in the fall. Cows fed on the corn when it is young do well, and the cream from the milk makes clear, hard butter and lots of it. Among others who have tried it are E. W. Hixon and Chas. Weeman.

REPAIRING LEVEES.—The Levee Commissioners of District No. 1 are having the piles driven along the bank of the Feather river near the mouth of the Yuba. The old piling, where it is not wholly washed out, needs repairing and will be put in good condition. The piles are driven into the river-bed near the bank to a depth of 30 feet, and are then planked across the top and heavy cables from the bank fastened to them so as to allow of no chance of the current loosening them. The action of the water along the bank at this place during the past spring was appalling.

Tulare.

SUMMER FALLOWING.—Porterville *Tidings*, Aug. 29: Already many of our farmers are making arrangements to begin soon the work of seeding their land for another crop. Frank Howe commenced plowing on his place just south of Plano last Tuesday, using a traction engine to pull the plows, but finding they would not work properly, he quit work for several days to construct a gang plow, to be composed of ten 10-inch plows, which he believes will work successfully.

Tulare.

WHEAT LAND WANTED.—Tulare, Aug. 29: There is much inquiry at present for wheat lands to rent for next season, so we are informed by one of our real-estate men. These inquiries come in so rapidly that the prospect is that all available lands will be taken.

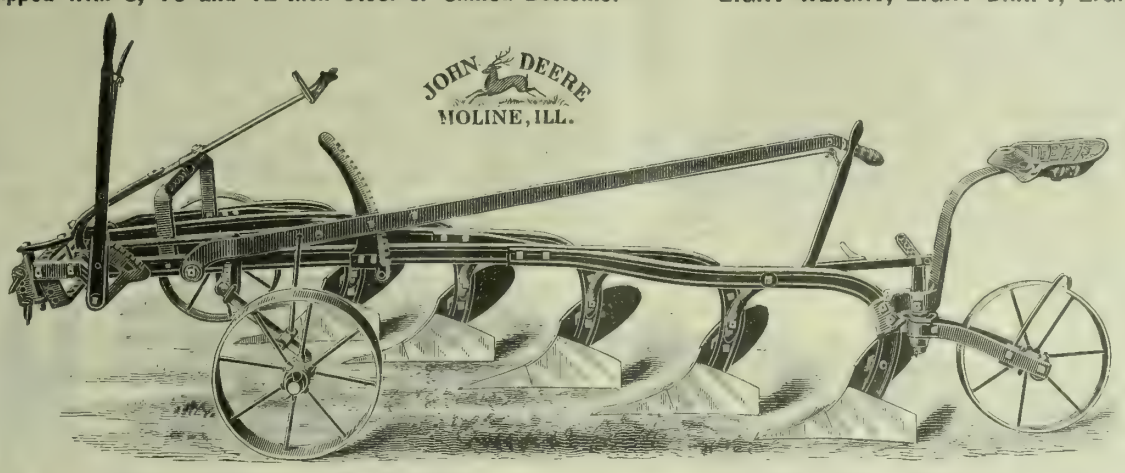
FIRST GRAPE SHIPMENT.—Tulare *Register*, Aug. 29: Paige & Morton to-day shipped nearly a carload of grapes to Porter Bros. of Chicago. These are the first shipped from Tulare in the fresh state. They will be followed by numerous carloads later on, and Tulare grapes will soon have as high a reputation in the East as her peaches, nectarines and pears have now.

EARLY RAINS.—Visalia *Delta*, Aug. 28: There have been heavy and frequent showers in the mountains recently. Whether this is indicative of an early winter or not we do not undertake to say, but in one respect at least the rains have done much good. They have dampened the carpet of falling leaves in the forests

(*Continued on page 204.*)

THE "NEW DEAL" SERIES OF WHEELED WALKING PLOWS.

Manufactured by JOHN DEERE & CO., Moline, Ills.



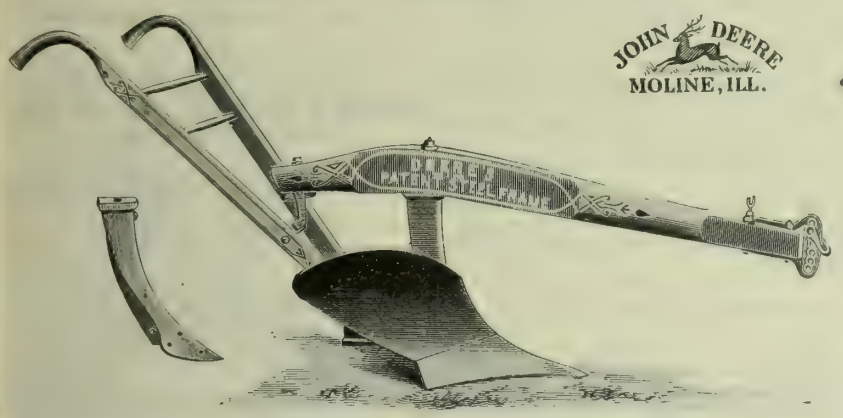
THE "NEW DEAL."

2, 3, 4 & 5 FURROW. Equipped with 8, 10 and 12-Inch Steel or Chilled Bottoms. **LIGHT WEIGHT, LIGHT DRAFT, LIGHT WORK for Man and Beast.**

Among other improvements, all 3, 4 and 5-Gang New Deal Plows are so constructed that the OUTER or REAR BEAM can be removed for use in first plowing, and READJUSTED for second or cross plowing.

For Lightness of Draft, Ease of Management, Strength, Durability, and Quality of Work,

THE "NEW DEAL" IS WITHOUT A PARALLEL.

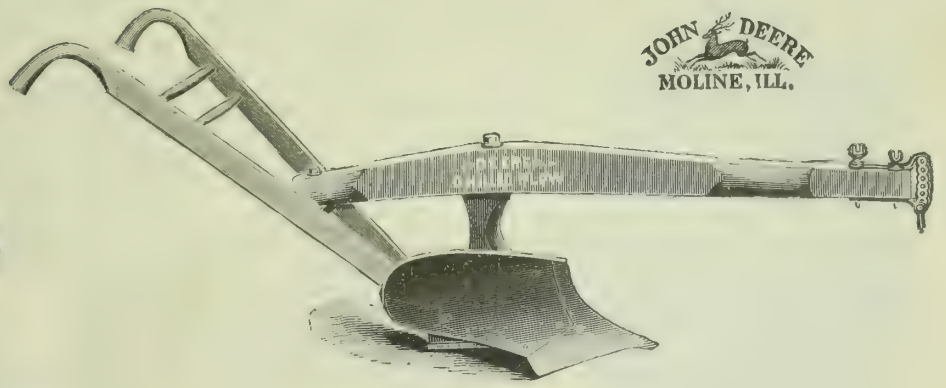


For VINEYARD and ORCHARD Plowing

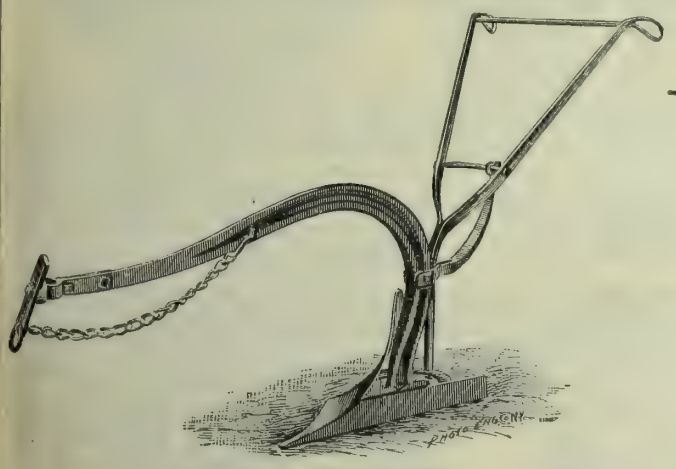
THE "NEW DEAL" HAS NO EQUAL!

Having no Tongue, and the team being hitched close to the work, it is so constructed that IT CAN BE RUN CLOSER TO THE TREES AND VINES than an ordinary Single Plow.

JOHN DEERE MOLINE PLOWS.



STEEL AND CHILLED BOTTOMS.

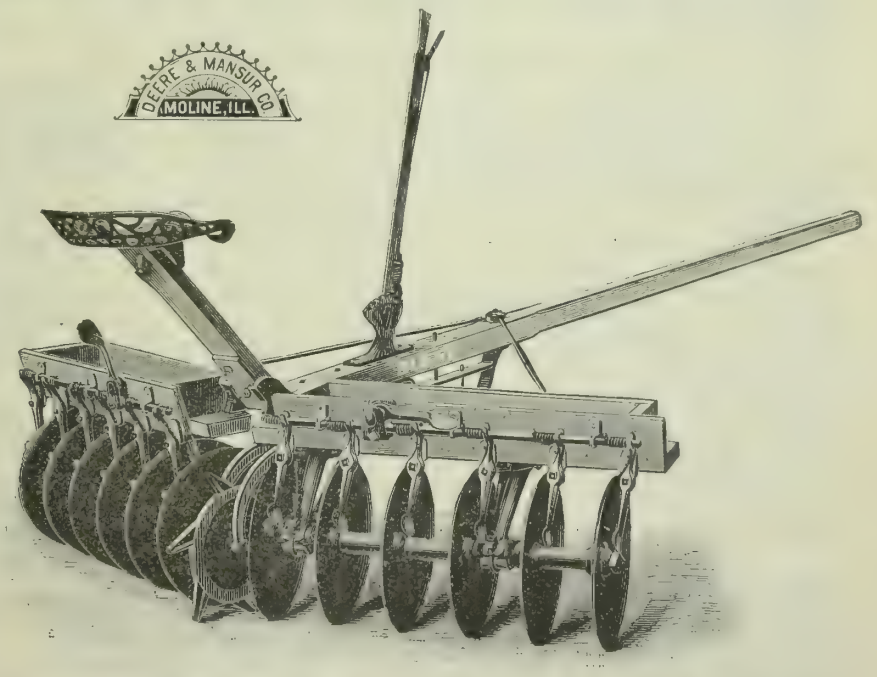


THE LEADING PLOWS ON THE PACIFIC COAST.

Above cut represents our latest style of "GENERAL PURPOSE PLOW." The Standard and Frame is one piece of Solid Steel, constituting the frame work to which all other steel parts are bolted.
This Plow is adapted for use in soils where extra scouring qualities are required.

DEERE CHILLED PLOW.

We call attention of Plow dealers (and Farmers particularly) of the Pacific Coast to the "DEERE CHILLED PLOW," manufactured by DEERE & CO., Moline, Ills. The well-known reputation of the "Deere" Plow is a guaranty that any goods made by Deere & Co. possess the highest qualities of merit; and we claim for the "Deere Chilled Plow" a superiority of workmanship, durability and general adaptability to the soils of this Coast over any Chilled Plow in the market.
The Plow (as shown in above cut) has the Sloping Landside, and in all respects is made to suit the requirements of the Farmer.
We ask that you give the "DEERE CHILLED PLOW" a trial, and convince yourself of its superior merit



THE DEERE ORCHARD & VINEYARD PLOW.

A Great Favorite with Vine-Growers and Orchardists.

STEEL BEAM, ADJUSTABLE HANDLES.

Sizes, 8 and 9-inch Steel Bottoms; also 9-inch Chilled Bottoms.

FOR VINEYARD AND ORCHARD WORK THESE TOOLS ARE UNEQUALED.

DEERE DISC HARROW.

Sizes from 5 to 12 feet with 16 or 20-inch Discs.

One Season's Experience has Proven it to be a most PRONOUNCED SUCCESS.

FOR PRICES AND FURTHER INFORMATION APPLY TO

DEERE IMPLEMENT COMPANY,

305 and 307 Market Street, San Francisco,

SOLE AGENTS FOR

John Deere Single Plows, "New Deal" Gang Plows, Cultivators, Harrows, Schuttler Wagons, Buggies, Carts, Etc., Etc.

Agricultural Notes.

(Concluded from page 202.)

so that fires do not spread readily, and there has been less destruction from this cause in the mountains of Tulare County this summer than during any previous dry season for a long period.

FRUIT SHIPMENT.—Visalia *Times*, Aug. 28: Twenty carloads of green fruit have been shipped from the Visalia railroad depot this season—one or two carloads for the East and the remainder to San Jose. These shipments were of the early varieties. In another week the late crop of peaches will begin to mature, and as the crop is very large, there will be from 20 to 30 more carloads shipped during September. This is the first season that green fruit in carload lots has been shipped from this point East.

DEMAND FOR PRUNE TREES.—*Times*, Aug. 28: I. H. Thomas, the nurseryman of this city, has already contracted to supply 10,000 prune trees to farmers in the immediate vicinity. B. C. Anderson states that he can make more money raising prunes, and selling them at two cents per pound after drying them, than can be made by raising wheat. But he sold his crop at five times that figure this year.

PROPOSED LARGE IRRIGATING CANAL.—Traver *Advocate*, Aug. 28: T. E Clark, one of the Board of Directors of the Kern and Tulare Irrigation District, is enthusiastic over the prospect for water. He says they can construct a canal on the line surveyed that will carry a stream of water 100 feet wide by 4 feet deep and yet not deprive any prior appropriator of one drop of water. The head of the proposed canal is located four miles higher on the stream than any other canal, and there will be no jangling over right of way; the supply of water is ample, so that it will not be necessary to condemn any other rights, or buy them off, or compromise the matter in any way whatever; the district is a prior appropriator of all the water it will ever need.

INDIANS FOR GRAPE-PICKING.—Traver, Aug. 28: Grape-picking has commenced in the California Fruit & Wine Land Company's vineyard. The Chinamen who were first employed struck for $1.75 per day and Superintendent West let them go and went to the foothills and secured Indians to do his work. This is much better for the county, for the money paid to the Indians for work is not sent out of the country as is the case with the Chinamen, but it is all spent at home. We would advise more of our vineyardists to try the same plan.

PLANTING FRUIT TREES.—Traver, Aug. 28: Thomas Boyd of the Mussel Slough country, says there will be considerable fruit put out this coming winter and spring in his neighborhood. He contemplates the planting of 100 acres on his own place to trees and vines this season and will not try to farm any more wheat there. He has leased land over by Huron for wheat, and expects to put out about 1200 acres there; but land that can be irrigated is too valuable to raise wheat, as fruit pays so much better where water can be had.

LARGE MELONS.—*Times*, Aug. 28: James Hulse of Farmersville, last week brought to this city a watermelon that weighed 71¼ pounds. He has a number of the same size in his patch, and it is probable that some of them will be secured for the Native Sons' exhibit at San Francisco.

Ventura.

ADAPTED TO CORN.—Ventura *Free Press*, Aug. 29: It has generally been understood that corn could not be advantageously raised in the Santa Ana. That idea, like a good many others of the same ilk concerning Ventura, has been practically disproven this year. One of Ventura's most successful farmers this morning informed a *Free Press* representative that there is a field of about 30 acres of as pretty corn growing in the Santa Ana as can be raised anywhere. The adaptability of this county's soil to the cultivation of cereals, fruits and beans, is beyond all question, and is proven whenever and wherever tested.

Yolo.

GRAIN CROP.—Woodland *Democrat* Aug. 28: The grain crop as reported by John Krummer, a thrashing-machine man, is fairly good. Mr. Krummer was out with his machine 44 days and thrashed out 39 ranches and traveled a circuit of 40 miles. After figuring all time out from the day he pulled out till the machine was laid up, his average per day aggregated 900 sacks of grain, averaging per sack 140 lbs. for wheat and 110 lbs. for barley.

FIRST RETURNS.—Wheatland, Aug. 31: Hoost Bros. sold the first car of California hops in New York yesterday for 40 cents per pound The hops were consigned to them by M. H. Durst, and it was the first car of the new Pacific crop to arrive in New York.

GRAIN STATISTICS.—Woodland *Mail*, Aug. 30: At present there are 35,000 sacks of grain stored in the Grangers' warehouse, and expect to swell the number to 40,000 before we close next week. There are no large lots this season; W. B. Gibson has the largest number of sacks, 8000, while O. A. & E. R. Lowe, H. E Coil, C. Hevel, R. H. Beamer, Tim Clifford, Joe Doran, Wm. Garrett, D. Clanton and M. Hays have stored from 1000 to 2000 sacks. About three-fourths of the wheat stored in this warehouse is No. 1, while the remainder is not so good. Major Freeman had 5000 sacks stored, but it has been shipped, he having sold it. The quality of the wheat is good, but the average is small. Last year Mr. Gibson stored over 15,000 sacks, and H. E. Coil had a crop of over 11,000 sacks, but this year neither has 10,000 sacks. Barley is a scarce article, as only 1500 sacks were stored in the house, and there would be 2500 more stored before the season closed.

NEVADA.

RECLAIMING NEVADA.—Reno *Gazette*, Aug. 28: Of all the men with a sack full of Nevada money, Mr. Newlands is the first to show that he takes any interest whatever in doing anything to develop Nevada's agricultural possibilities. He has invested something like $100,000 in reservoirs and reservoir sites for the storage of water in Western Nevada, and he is by no means through with the good work yet. He has used his tongue and pen most vigorously to induce other Nevada capitalists to put up something for the common cause. Mr. Newlands will put the State in a position to make capital wonder that the splendid advantages offered by Nevada have so long been overlooked.

THE STABLE.

Capt. Collier's Percherons.

EDITORS PRESS:—Your representative lately visited the Percheron breeding farm, near Lakeport, where there are the largest number of recorded animals to be found at any one farm this side the Rockies and the largest percentage of the most populous strains of the breeds. In selecting his location, Capt. Collier was thinking first of its beauties as a home, and so chose one of those magnificent villa sites that surround Clear lake. Take a ride with him, surrounded by his charming family, in his steam launch on a summer evening, and you will see why he was willing to locate away from a railroad. To make it easier for customers to see his stock, he proposes soon to establish a stable at some near point on the S. F. & N. P. railroad. This will be duly announced in his advertisement.

It seems a great shame that this stock should not be shown at the State Fair, but if you were in Capt. Collier's place you might think twice. Not less than 12 animals would fairly represent the stud, and the services of six to eight grooms would be necessary. For the 10 or 12 days away from home, one could not safely expect to spend under less than $500. When the railroad comes up to Lower lake, he will take the horses down in his barge and get them to Sacramento without trouble or delay. When buyers want to see the horses, they can combine pleasure with business and ride from the depot to the ranch in a steam launch. That railroad will fairly electrify Lake county. Where one visitor comes over the stages, they can fairly expect ten by rail.

But to get back to horse talk, many remember having seen Pablo in the streets of San Francisco last spring and hearing him spoken of as the finest horse of the breed they had ever seen. Now there are many more as good up here. To show how good these horses are at their best, we will draw upon records of some of their performances in France.

Percheron Trials in France as Reported by M. W. Dunham.

Under saddle for one and a fourth miles—Best time, 3:50, or a mile in 2:48; average 29 results, 4:12, or a mile in 3:18.

Under saddle for one and five-sixths miles—Best time, 4:38, or a mile in 3:4; average 31 trials, 6:40, or a mile in 3:38.

Under saddle for two miles—Best time, 6:2, or a mile in 3:1; average 40 trials, 7:20, or a mile in 3:4.

Under saddle two and one-half miles—Best time, 7:35, or a mile in 3:2; average 65 trials, 9:15, or a mile in 3:32.

Horses to harness, two miles—Best time, 7:17, or a mile in 3:38½; average eight trials, 7:36, or a mile in 3:48.

Horses to harness, two and three-fifths miles, loaded—At Rouen, Decide drew 386 pounds in 9:27, or at the rate of a mile in 3:39.

The Best Trial of All

M. Montreauil of Alencon drove his mare from Berney to Alencon, 55 3 5 miles, to a tilbury, over a hilly and difficult road, in four hours and 24 minutes. In '85 the animal was still hauling the omnibus at Lees. Capt. Collier says the tilbury used in France is about as heavy as our two-horse farm wagon. This was at the rate of 12.6 miles per hour.

M. Cousturer of Fleury sur Andelle drove his mare to a tilbury from Lyons la Fossette to Point Audmere, a distance of 58 miles, in one day and back the next. On the first day her time was 4 hours 1 minute and 35 seconds. On the second day she beat her own time by five seconds. Fancy driving one horse in one of Wells, Fargo's express wagons from Oakland to Elmira between 8 A. M. and noon and repeating the trip next day in same time.

Farmers have an idea that the Percheron is not a general-purpose horse, and of course they are not if chief among the farmer's purposes is to draw a feather-weight sulky around a track. But if all the family want to go to town and take along the butter and eggs and bring back a week's or a month's supplies, how can they do better than to drive one of this kind of horses? If 12 miles or 10, or even 8 miles an hour, is not fast enough for a farmer, he must be in a great hurry.

When you come to draw a load, it is a pleasure to know that it is going to be moved easily without any looking around to see what you are going to do about it. There is some fun in walking behind the plow when it turns a good, deep furrow at a lively pace, without any seesawing, panting or stopping to rest. For a farmer who keeps only one horse it is quite an advantage to have only one horse to feed or shoe, yet be able to draw a two-horse plow, or harrow or load when occasion requires, and besides this have a pet that will never harm one of the children. They are brought up that way in France, you know. Figures given in these trials are well authenticated, but often doubted for the reason that some importers have paid more attention to size than action; in other words, have bought flesh rather than muscle—more beef than horse.

In making his selections, Capt. Collier fully appreciated the importance of these points, and made up his herd from the produce of Brilliant 1271 (755) and Cesar 3526 (601).

Besides being one of the handsomest of all draft animals, and the one selected by Rosa Bonheur for her masterpiece, Brilliant is one of the most active of the breed. R. S. Judson, ex-Secretary of Minnesota State Agricultural Society, told the writer that he saw Brilliant jump clear from the ground as high as a man's head. Cesar was a prize-winner in France, in New Orleans and at St. Louis, and was never beaten on a show-ground. He was pronounced by good judges the finest draft-horse ever shown at St. Louis. He could trot a mile in four minutes, moving almost with the power of a locomotive. All work-horses are left entire in France. Many a large-grade horse has been imported and passed as a Percheron. Now those who stop to think, know that prepotency depends upon purity of blood. It is not safe to conclude that an animal is pure unless recorded in France, and in that case they are almost certain to be recorded here. In France, horse-breeding has been done by selection under government supervision for a long time, and the colts have been exercised rather than pampered, a lesson that we would do well to heed in this country. F. S. C.

A Remarkable Trotting Horse.

EDITORS PRESS:—The writer, while in Lake county lately, visited the horse farm of A. B. Rodman and was specially impressed with the celebrated horse Advocate (6543). He is a compact-built horse much of the style of the famous Vermont Morgans, round-barreled, close-ribbed, short-backed, long-hipped, broad, full chest, bright eye, intelligent countenance, 1100 pounds and all horse.

In looking up his pedigree we found the blood of Maud S., the fastest horse; Goldsmith Maid, the best horse that ever trotted, and the famous Dexter among the recent crosses. In the remote crosses we find thoroughbred Black Hawk and Messenger blood. There are two close crosses on the side of the sire and one on the dam's side to Hambletonian. His sire was Attorney (1005, sire of Atto Rex and others in the 2:30 list). Attorney was by Harold and his dam by Alexander's Abdallah.

Advocate's dam was by Green's Bashaw (50), sire of 16 in the 2:30 list and of ten sires of 20 in the 2:30 list, and of 11 dams of 18 in the 2:30 list.

Mr. Rodman has nine brood mares from such standard sires as Whippleton, Richmont, Milton, Medium, Berger, Attorney, Rob Roy McGregor, McDonald Chief and Fisk's Mambrino. We saw with these mares a fine band of sucklings and yearlings from Advocate. Mr. Rodman loves trotting horses and means to stay with them. F. S. C.

Complimentary Samples.

Persons receiving this paper marked are requested to examine its contents, terms of subscription, and give it their own patronage, and as far as practicable aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription, paid in advance, 5 mos, $1; 10 mos., $2; 15 mos., $3. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber, please show the paper to others.

BISHOP FAIR.—The RURAL acknowledges the compliment of a "membership ticket" to the Fifth Annual Eastern Slope Fair, which is to be held at Bishop, Inyo county, Sept. 10th to 13th. We hope the exhibition will be a success throughout.

FEARLESS.

This Threshing-machine received the two last Gold Medals given by the New York State Agricultural Society, and has been selected, over all others, and illustrated and described in that great work, "Appleton's Cyclopedia of Applied Mechanics," thus establishing it as the standard machine of America. Straw-preserving Rye-Threshers, Clover-hullers, Ensilage-cutters, Feed-mills, Fanning-mills, and Wood Saw-machines; all of the best in market. The Fearless Horse-powers are the most economical and best. Write for circulars and prices.

MINARD HARDER, Cobleskill, N. Y.

Look for Good Things.

A man educated will succeed the best, a mechanic with the best tools will do the finest work and whoever presides in the kitchen will obtain the best results with the least trouble when supplied with the best appliances.

The combination frying-pan and toaster is a case in point. It will give you a juicy steak and elegant toast whether over coals or a smoky fire. Cook onions or anything without the odor penetrating the house. Can be used over coal, wood or gasoline with equal facility. Then comes the improved baker and roaster; using this, no burnt bread is possible, does its own basting. Retains all the vapors arising while roasting, a delicious gravy is the result and the meat made juicy and tender. Other indispensable novelties for kitchen use found only at the Novelty Hardware Co., 1433 Market St. Send for circulars.

Dewey & Co.'s Scientific Press Patent Agency.

OUR U. S. AND FOREIGN PATENT AGENCY presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American and foreign reports, files of scientific and mechanical publications, etc. All worthy inventions patented through our Agency will have the benefit of an illustration or a description in the MINING AND SCIENTIFIC PRESS. We transact every branch of Patent business, and obtain Patents in all countries which grant protection to inventors. The large majority of U. S. and Foreign Patents issued to inventors on the Pacific Coast have been obtained through our Agency. We can give the best and most *reliable* advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and Circulars free.

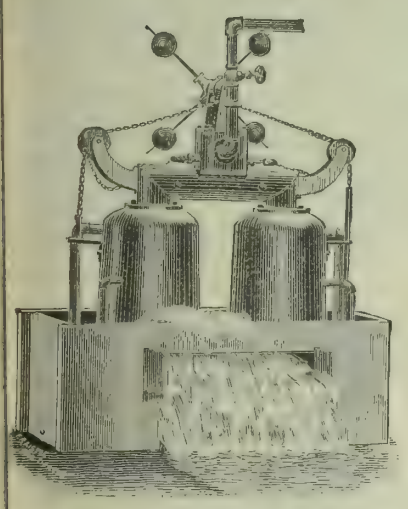
IF YOU WANT WATER



—IN ANY QUANTITY—

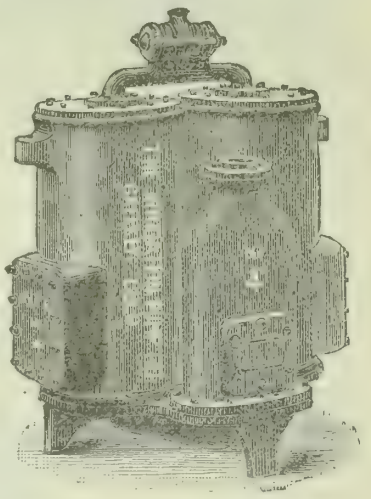
For Stock, Household Use or Irrigation,

THIS WILL INTEREST YOU.

*

THE HUFFER & NYE
Steam Vacuum Pumps.

These powerful Irrigating Pumps are operated by Steam Boilers and are without Pistons or any parts to wear out.



Will pump from 50 to 2000 gallons per minute. With live steam will raise 60,000 gallons of water 20 feet high with one bushel of coal.

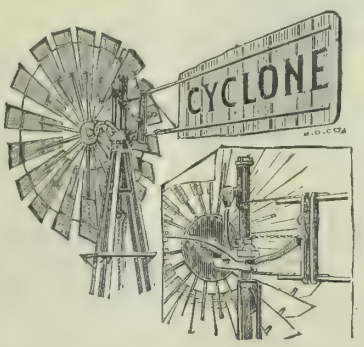
NO STEAM PRESSURE REQUIRED, except on a lift above that made by the atmosphere, which is about 30 feet at sea level.

Will pump dirty or gritty water equally well, or 40 to 60 per cent sand or gravel.

They can be bought and put in position ready for work cheaper than any other pumps of the same water-lifting capacity. There is no loss of atmospheric pressure produced by condensing the steam. No skilled labor required to run them. Any ranch man can operate them. They cost no more than water right and can be operated at a nominal expense.

Address PACIFIC MANUFACTURING COMPANY, 575 Mission Street, San Francisco, Cal., for particulars and illustrated circulars regarding these wonderful irrigating pumps.

CYCLONE WINDMILLS.



10 TO 30-FOOT WHEELS.

Cyclone Geared Wind Engines,

16 TO 30-FOOT WHEELS.

Star Mills, Hoosier Tubular Well Tools and Supplies.

Wells can be sunk from 50 to 100 feet per day. They will work rapidly and successfully in any kind of material, including rock, hard pan, cement gravel, quicksand, boulders, etc., etc.

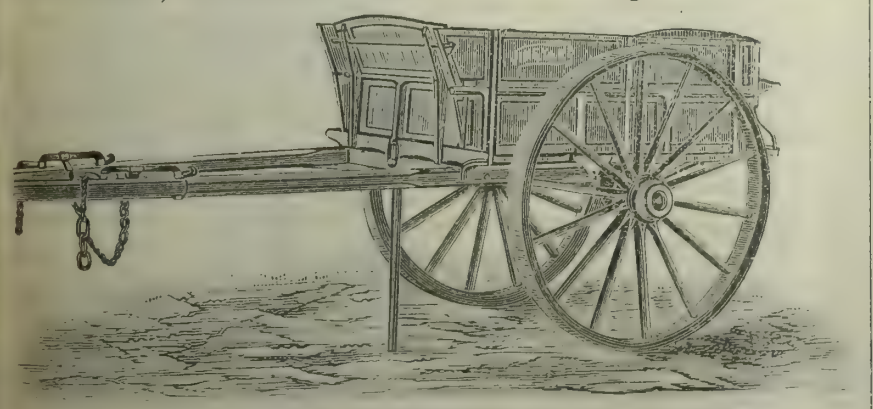
SUPERIOR REDWOOD TANKS.

Windmill Pumps, Hand Pumps, Steam Piston Pumps, Rotary and Power Pumps, Deep Well Pumps.

Brass, Brass Lined and Iron Working Barrels. Brass, Brass Lined and Iron Double Packed Cylinders. Brass Goods, Gas Pipe, Fittings.

Philadelphia Lawn Mowers, Lawn Sprinklers, Movable Fountains.

Rubber Hose, Belting and Packing.



Our Windmill Catalogue is full of useful information relating to Windmills, Tanks, Pumps, Etc. "Send for one."

TRACK AND FARM.

The State Fair Races.

The State Board of Agriculture met Thursday, August 6th, to make preliminary arrangements for the State Fair, which begins on September 8th and continues two weeks. The entries were opened, and it was found that all the events had filled except two, and for one of these a free-for-all race was substituted. The entries indicate that the races—which begin on Thursday, September 11th—will be equal to anything ever seen at the State Fair. The entries are as follows:

First Day Thursday, September 11th

No. 1. Trotting (The Occident Stake)—A trotting stake for foals of 1887. Entries closed January 1, 1888. Entrance, $100, of which $10 must accompany nomination; $15 to be paid January 1, 1889; $25 January 1, 1890, and $50 thirty days before the race. The Occident Gold Cup, of the value of $400, to be added by the society. First colt, cup and six-tenths; second colt, three-tenths; and third colt, one-tenth of stake. Five to enter, three to start; otherwise National Trotting Association rules. Mile heats, three in five, to harness. Closed in 1888 with 53 nominations. Value of stake January 1, 1890, $1835.

The following have made third payments:

1. Palo Alto Stock Farm, b f Wild May, by Electioneer, dam May by Wildidle.
2. Palo Alto Stock Farm, b f Coval, by Electioneer, dam Columbine by A. W. Richmond.
3. Palo Alto Stock Farm, br f Clarion, by Ansel, dam Consolation by Dictator.
4. Palo Alto Stock Farm, ch c Norris, by Ansel, dam Norma by Alexander's Norman.
5. Palo Alto Stock Farm, b f Wildmont, by Piedmont, dam Wildflower by Electioneer.
6. Jos. Cairn Simpson, b f A., by Antevolo, dam Lady Del Sur by Del Sur.
7. B. E. Harris, br or blk f Lorena, by Jim Mulvaney, dam Elmorene by Elmo.
8. Lot D. Slocum, b f Moss Rose, by Anteeo, dam Luella by Nutwood.
9. H. H. Helman, gr g Richmond Chief, by Monroe Chief, dam Eta by A. W. Richmond.
10. G. Valensin, blk f Fleet, by Sydney, dam Flight by Buccaneer.
11. P. Fitzgerald, b c Kill Ross, by Killarney, dam by Cal. Dexter.

No. 2.—Trotting—Purse $1200; 2:22 class.

1. J. L. McCord, ch m Mary Lou, by Tom Benton, dam Brown Jennie by Dave Hill Jr.
2. La Siesta Ranch, b m Wanda, by Eros, dam Accident by Elmo.
3. San Mateo Stock Farm, b m Sister V., by Sydney, dam Nettie Lambert by John Nelson.
4. G. A. Doherty, br s Victor, by Echo, dam by Woodburn.

No. 3.—Pacing—Purse, $800; 2:30 class.

1. C. W. Godard, ch Pinto g C. W. G., by Adonis, dam inbred to St. Clair.
2. John Garrity, ch g Hummer, by Sidney, dam Humming Bird.
3. Napa Stock Farm, b g Gold Medal, by Nephew, dam unknown.
4. H. Willis, b g Our Dick, by Gibraltar, dam Mattie W.
5. S. C. Tryon, blk s Costillo, by Echo, dam Bessie Turner by Fred Low.
6. John Patterson, blk m Princess Alice, by Dexter Prince, dam Mollie by General McClellan.
7. Owen Bros., ch g T. B., by Juanito, dam unknown.
8. San Mateo Stock Farm, ch h Rupee, by Guy Wilkes, dam Sable Hayward by Poscora Hayward.
9. J. G. Moran, b g McGinty, by Daniel Lambert, dam by Davy Crockett.

Second Day—Friday, September 12th.

No. 4.—Running. Opening scramble for two-year-olds. A sweepstake of $25 each; $25 forfeit, or only $10 if declared on or before September 1st; with $350 added, of which $50 to second. Winners at this distance in 1890 once to carry three pounds; twice, five pounds extra. Maidens allowed five pounds. Three-quarters of a mile.

1. Palo Alto Stock Farm, b c Nero, by Flood, dam imp. Queen Bess by Strathconan.
2. Palo Alto Stock Farm, ch f Rosebud, by Wildidle, dam imp. Rosette by Struan.
3. Undine Stables, Quena, by Kyrle Daly, dam Rachel.
4. H. I. Thornton, br f Bessie Barnes, by Darebin, dam Carrie C.
5. H. I. Thornton, ch g Arcade, by Milner, dam Nannie Hubbard by Hubbard.
6. L. U. Shippee, b c Lodowic, by Longfellow, dam Carrie Phillips, by Pat Malloy.
7. L. U. Shippee, b f May H., by Falsetto, dam Glenluine by Glenelg.
8. L. U. Shippee, b f False Queen, by Falsetto, dam Queen Victoria by Lexington.
9. William H. Frye, b f Lady Franklin, by Joe Hooker, dam by Odd Fellow.
10. M. T. Walters, b c Altus, by Billy Bolinger, dam Della Walker.
11. Dennison Bros., ch f Minnie B., by Prince of Norfolk, dam Lizzie Idle.
12. John Reavey, ch c by Joe Hooker, dam Lady Stacy.
13. O. Harrison, b c Hy Lo, by Cyrus, dam Katharine.
14. Elmwood Stables, b c Duke of Milpitas, by Duke of Norfolk, dam Gypsy.
15. Owen Bros., b s Hero, by Wildidle, dam Precious by Lever.
16. W. M. Murry, blk c Power, by Powhattan, dam Lawn Tennis.
17. W. M. Murry, b c Aristocrat, by Flood, dam Cuba.
18. L. J. Rose, b f Fairy, by Argyle, dam imp. Fairy Rose by Kisber.
19. L. J. Rose, b h Conrad, by Flood, dam imp. Goula by Exminster.

No. 5.—Running — The California Breeders' Stake—A sweepstake for three-year-olds (foals of 1887); $100 each, h f, or only $10 if declared January 1st; $15 May 1st; or $25 August 1, 1890; declaration void unless accompanied by the money; with $600 added; of which $150 to second; $100 to third. Winner of any stake race in 1890 of the value of $1000 to carry five pounds; of two or more, ten pounds extra. Maidens allowed five pounds. One mile and a quarter. Closed in 1888 with 39 nominations.

No. 6.—Running—The Rosemeade Handicap, for all ages; of $50 each, h f; $15 declaration; with $400 added; second to receive $100, and third $50 for the stakes. Weights announced by 10 A. M., and declarations due by 6 P. M. September 11th. One mile and one-eighth.

1. Palo Alto Stock Farm, b c (5) Peel, by Monday, dam Precious by Lever.
2. Palo Alto Stock Farm, ch f (3) Muta, by Wildidle, dam imp. Mutiny by Adventurer.
3. Undine Stables, ch g (5) Tycoon, by Reveille, dam Margery by Error.
4. P. Siebenthaler, ch c (3) Sheridan, by Young Bazaar, dam Lost Girl by Leinster.
5. H. I. Thornton, br m (6) Abi, by Red Boy, dam Abi by Woodburn.
6. L. U. Shippee, br m (4) Picnic, by imp. Mr. Pickwick, dam Countess by Theobald.
7. Charles Kerr, ch s (5) Jackson, by Luke Blackburn, dam Ivy Leaf.
8. J. J. Dolan, b g (4) Revolver, by Joe Daniels, dam by Partisan.
9. Captain A. B. Anderson, ch s (4) Four Aces, by Hock Hocking, dam Maid of the Mist.
10. Santa Barbara Stables, b s (4) Othello, by Hock Hocking, dam Sunday.
11. Elmwood Stables, b g (5) Nabeau, by Nathan Coombs, dam Beauty.
12. W. L. Appleby ch m (5) Carmen, by Wildidle, dam Nettie Brown.
13. W. L. Appleby, b m (3) Raindrop, by Wildidle, dam imp. Teardrop.
14. Wesley George, b g (7) Applause, by Three Cheers, dam Alice N.
15. O. Appleby, br m (4) Alfarata, by Wildidle, dam Monday Filly.
16. Matt. Storn, ch m (4) Lurline, by Longfield, dam Katy Pease by Planet.
17. Matt. Storn, ch m (4) Marigold, by Milner, dam Katy Pease by Planet.
18. N. A. Covarrubias, b s (4) Dan M. Murphy, by imp. Speculator, dam Leona.

No. 7.—Running—Selling purse, $300, of which $50 to second; for all ages; horses entered to be sold for $1500 to carry rule weights; two pounds allowed for each $100 less, down to $1000; then one pound for each $100 less, down to $500. Horses entered not to be sold to carry five pounds above the scale. Valuation to be placed on starters only by 6 P. M. the day preceding the race. Mile heats.

1. M. T. Walters, b g (4) Albatross, by Pill Box, dam Della Walker.
2. Dennison Bros., b g (2) Dave Douglas, by Leinster, dam Lilly Simpson by Newry.
3. H. D. Miller ch m (2) Ida Glenn, by Glen Ellen, dam Queen.
4. J. N. Van Winkle, b g Silverbow, by imp. Fechter, dam Belle of the Mead.
5. Albert Hiller, b g (3) Achilles, by Norfolk, dam Thetis by Ten Broeck.
6. Elmwood Stables, br m (4) Installation, by Inauguration, dam Brown Maria.
7. W. L. Appleby, b g (4) Wild Oats, by Wildidle, dam Mary Givens by Owen Dale.
8. Wesley George, b g (2) Applause, by Three Cheers, dam Alice N by Norfolk.
9. Matt. Storn, ch s (3) Larghetta, by Jils Johnson, dam Leveret by Lever.
10. C. Holloway, ch g (5) Forester, by Joe Hooker, dam Mattie C. by Specter.
11. L. J. Rose, s g (2) Mikado, by Shiloh, dam Margery by Error.

Third Day—Saturday, September 13th.

No. 8.—Trotting, Two-year-old stake—Entrance, $50, of which $10 must accompany nomination; $15 payable July 1st, and remaining $25 August 10, 1890; $300 added by the society. Closed March 15, 1890, with 14 nominations. Mile heats.

The following have made second payments:

1. San Mateo Stock Farm, ch f Vida Wilkes, by Guy Wilkes, dam Vixen by Nutwood.
2. Souther Stock Farm, b c El Benton, by Electioneer, dam Nellie Benton by Gen. Benton.
3. Souther Stock Farm, blk c Jim Sinfoot, by Figaro, dam Fanny Sinfoot by Irwin Davis.
4. Palo Alto Stock Farm, br c Almoneer, by Alban, dam America by Hambletonian 10.
5. Palo Alto Stock Farm, b f Elleneer, by Electioneer, dam Lady Ellen.
6. B. E. Harris, ch f Starlight, by Dawn, dam Lena Bowles by Ethan Allen.

2. San Mateo Stock Farm, b f Millie Wilkes, by Guy Wilkes, dam Rosetta by The Moor.
3. Palo Alto Stock Farm, br f Alzira, by Ansel, dam American Girl by Toronto Sontag.

A Group of Colusa Shorthorns.

We present this week a cut of three Shorthorns, the property of Messrs. Bridgford and Bedell of Colusa, Colusa county, California. These animals have all been winners at the fairs of this State.

Manunga 2d bears the distinction of being the only Shorthorn cow that ever captured the sweepstake premium of the California State Fair at the age of one year. She was awarded the sweepstake premium at the California State Fair in 1888, being at the time one year old. Her mother, Manunga, has been awarded a number of premiums, and is to-day regarded by many good judges as one of the best Shorthorn cows in California. In fact, all of the Manunga family are show cattle. They are uniformly solid red in color, and are noted for their breadth of back and prominent bright eyes.

Scotch Billy is now two years old. He is a pure-bred Cruickshank, and is as handsome an animal as can be found anywhere. A Kentucky breeder of Shorthorns, who saw him at the State Fair last year, was very anxious to purchase him to ship to Kentucky to head his herd, but his owner would not part with him. Scotch Billy was awarded the first premium in his class at the California State Fair in 1889, and was also given second place in the sweepstake class, he being at the time one year old and was in competition with as fine an exhibit of aged bulls as ever graced a showyard in California. He possesses all of the characteristics of the Cruickshanks—is close to the ground, of massive build, and he is said to be remarkably easy to keep in flesh. He is proving himself to be a first-class breeder.

The State Fair will yet hear from the increase of the Manunga family and Scotch Billy. Messrs. Bridgford and Bedell do not aim to keep a large herd, but it is their aim to be excelled by no one in quality.

Shorthorn Sale at Sacramento.

EDITORS PRESS:—We respectfully call the attention of your readers to a sale of pure-bred Shorthorn cattle to be held under the management of the Pacific Coast Shorthorn Breeders' Association at Agricultural Park, Sacramento, Friday, Sept. 19th. This association, as you are aware, comprises the best breeders of Shorthorns on this coast, and that cattle come from their herds should be sufficient guarantee as to their quality. A variety as to ages is offered from calves to full-grown cattle, all registered in the American Shorthorn Herd-book. Never was such an opportunity given here before or better stock offered.

The object of this association is to place their stock before the public and represent them as they really are. Their sale held last spring gave satisfaction to all purchasers. The demand is for better cattle with individual merit, and they can be found at this sale. The introduction of pure blood into the herds and grading them up will crown the efforts of the breeder with success.

The following well-known breeders contribute stock to this sale:

A. Heilbron & Bro., Sacramento; P. H. Murphy, Perkins; E. S. Driver, Antelope; E. A. Bridgford, Colusa; Estate of C. Younger, San Jose; P. S. Chiles, Davisville.

Many of these animals have been prize-winners at the principal fairs.

Remember the date of sale—Friday, Sept. 19th.

Catalogues can be had on day of sale or by applying to

J. F. CHILES, Sec'y, Davisville, Cal.

Davisville, Sept. 1st.

AGRICULTURAL IMPLEMENTS.

SPRING WAGONS, CARTS,
BUGGIES, HARNESS, ETC.

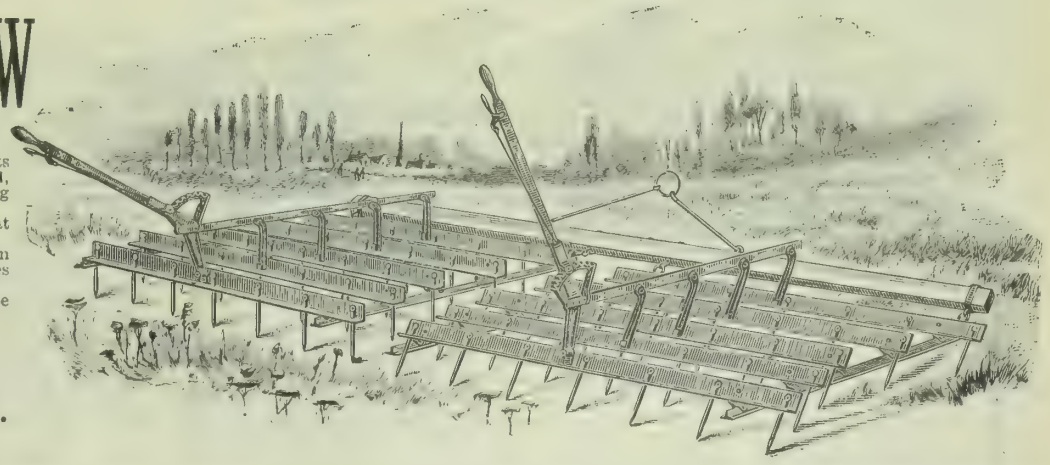
General Agents for Fish Bros. Wagons Co.

Our stock of Spring Wagons includes all the different styles, from a light Road Wagon to a Standard CALIFORNIA FOUR-SPRING. We guarantee these wagons. They are well made, of first-class material, finely finished and of great merit. Prices range from $60 up. Circulars furnished on application.

For Road Carts we have the BLUE RIBBON, the FLINT DROP BAR and the ACME, all well known and of great popularity.

☞ FISH BROS.' FARM WAGONS.

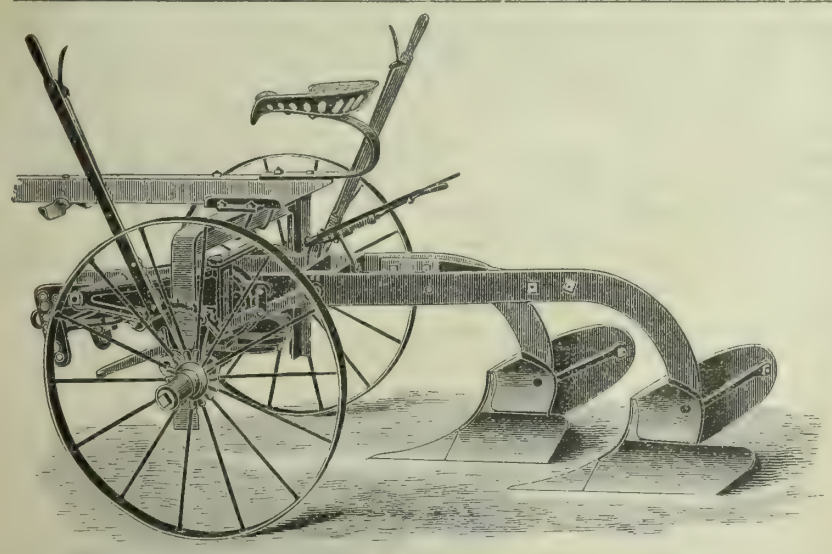
STEEL FRAME LEVER HARROW



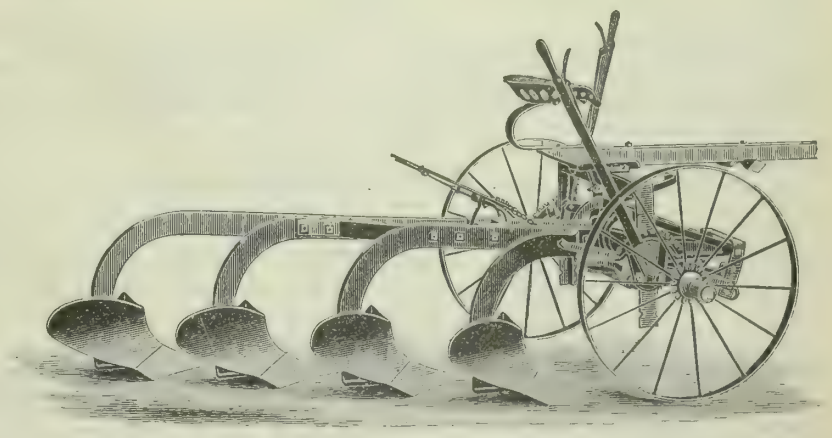
Possesses many valuable improvements over any other of like kind. Notably its RUNNERS, of T-shaped steel, hinged to the bars, with their flat surface to the ground, forming a convenient and perfect means for transporting the harrow, without loading into a wagon, besides adding greatly to the strength and rigidity of the frame.

The BARS are of ANGLE STEEL. The TEETH are diamond shaped and of great strength and effectiveness.

The LEVERS are conveniently located for adjusting the teeth from a vertical position to any desired angle for pulverizing, smoothing, or clearing off trash. These changes can be made without stopping the team.



All connections are firmly made with bolts, and there are no weak castings to cause trouble



PRICE: 60-Tooth 2 Section, $25; 90-Tooth 3 Section, $37.50.

ROCK ISLAND PLOWS, GANGS, HARROWS, Etc.

FLORIST AND GARDENER.

Suggestions for Ornamental Planting.

[Read before the Ladies' Annex to the San Diego Chamber of Commerce by C. R. ORCUTT and furnished for publication in the RURAL PRESS.]

Landscape art, that branch of horticulture that treats of the artistic planting of public or private grounds, is a science requiring peculiar qualities in the student. The artist must be free of prejudice either for or against any particular tree or plant. A geologist in public life, by the ethics of his profession is debarred from possessing any interests in mining properties lest his judgment should be influenced by his personal interests. It is also true that a landscape artist should not be engaged in any other branch of horticulture lest he should unconsciously blunt his perceptive power. To be thoroughly qualified for a position as a landscape artist, one should, however, be both a botanist and a practical horticulturist—in the cultural sense—as well.

Landscape art aims to improve the natural scenery. In the introduction of alien trees and shrubbery, great care should be taken to preserve the natural harmony of the scene. Landscape-gardening is becoming better understood than formerly. The term was once synonymous with the custom of introducing as striking and incongruous elements as it was possible for the old-time "artist" to conceive. The gardener delighted in planting flaming beds of foliage plants and brilliant flowers—beautiful in their proper places, but an eye-sore to all possessing a true sense of art; but happily, strong contrasts are no longer eagerly sought. The modern artist, if an artist in the true sense of the term, only ventures to use these brilliant colors where they will blend harmoniously with their surroundings. Trees are no longer tortured into abnormal shapes to please an equally abnormal taste in his patron. Elephants and Indians are no longer sketched in vivid life colors on our lawns, except where the proprietor of the lawn belongs to the class of the new rich. The physician does not seek to cure disease; he expends his energy to aid Nature in her effort. Thus the true artist does not attempt to improve upon Nature; his duty lies in aiding and directing Nature in her beautiful work. Only impostors in either profession claim all the credit.

Nature herself is careful to preserve an unbroken harmony. In improving and beautifying the park of San Diego, this harmony should not be destroyed. Leave the canyons and their approaches in a state of nature. Let the rocks ornamented with lichens remain. Preserve intact what little natural shrubbery that remains unmarred by man. Then utilize the balance as you may; render it more useful and attractive to the multitudes; transplant our rarest natives and naturalize the most beautiful foreigners, but do not impose on good Nature! In brief, imitate her as closely as surrounding circumstances will permit.

I have suggested the transplanting to our park of some of our rarest natives. I will add a few words regarding some of our choicest ornamental trees and shrubs, which the visitor in Southern California, if versed even slightly in either botany or horticulture, would expect to find in our midst.

The first of these is the Soledad or Torreyan Pine (Pinus Torreyana), noted the world over as one of the rarest of known trees. Until very recently San Diego possessed within her corporate limits, or closely adjoining, the only trees known of this interesting maritime pine. This pine was discovered by the late Dr. C. C. Parry—to whose botanical labors San Diego will always be deeply indebted—and was named by him in honor of our greatest American botanist, Dr. John Torrey. Only a year or two ago, Mr. T. S. Brandegee of the California Academy of Sciences discovered another small grove of this species in a little frequented part of one of the Santa Barbara islands. Thus the monopoly is broken, but San Diego still possessed practically the only trees accessible to travelers in general, and many have visited our city expressly to see this lingering remnant of a forest belonging to a past age. It can be found in cultivation in the principal European countries, where it has been successfully grown from seed. Is it not worthy of being perpetuated in its native city?

General Fremont, whose name is inseparably connected with that of California, is also identified with the history of many of our trees and plants. One of our native trees, which in cultivation is one of the most graceful and ornamental in the world, bears the significant name of Fremontia Californica. It is not rare in some of our most unapproachable, rocky canyons, where it is content to adapt itself to circumstances as best it may, and frequently never attains a size above that of a sprawling shrub. It never becomes a large tree where I have seen it, but in cultivation, seems to quickly forget its formerly circumscribed condition, and successfully vies with its cultured neighbors. Aside from the historical association, its beauty and symmetry, the evergreen foliage and large, abutilon-like flowers not only recommend it for public grounds, but private lawns as well. It can be seen on Coronado beach, and I understand one is growing in Mrs. Pierce's garden on Fourth street near Fir.

Probably few appreciate, because of its abundance, the beauty and good qualities of our "California Heather" or Adenostoma (*A. fasciculatum*), better known to many old residents as "Greasewood." Its dark evergreen foliage, finely divided and graceful branches, renders this one of our most widely distributed of the West American shrubs, also one of the most useful to the landscape artist, and if not known at home is appreciated sufficiently abroad. Formerly this formed for miles and miles an unbroken stretch of refreshing green during the forbidding dry season and greatly relieved the barren look of Southern California at that trying portion of the year. Words are useless to describe the scene when this sea of green was converted into a mass of undulating, fragrant white blossoms. This lovely shrub is rapidly giving way on mesa and hill to the orange, the apple and the vine. Is it too much to ask that it shall not be exterminated from the park, where it is still abundant, to make room for perhaps less desirable aliens?

What the Mayflower, or Trailing Arbutus, is to New England is the Manzanita to California. If each State were to select a floral emblem for itself, no more appropriate flower than this could be found for South California, and certainly no State could secure a loveller token than a spray of these blushing snow-white blossoms. It is the earliest harbinger of spring in our mountains, where I have seen the snowflakes descend on its wax-like bells, distinguishable from the snowflakes only by a delicate flush of red on its corolla. It still grows modestly in some of the canyons in the park, but needs a little encouragement before it will thrive in more public places.

Too much cannot be said in praise and commendation of that regal beauty (*Romneya Coulteri*) which has so completely captivated the attention of the English and European nations. This is one of the few things which seems to be fully appreciated both at home and abroad. If transplanted with care or propagated from cuttings under glass, I consider that it can be easily grown. To start from the seed requires experience and time. It forms large clusters, often 15 feet in hight, and has produced its delicate, wax-like flowers in cultivation in this city that were *nine inches across by actual measurement*. "The great white California poppy" (as it is described in English catalogues) should be planted abundantly in the park, and should also be seen in more of our private gardens.

Another ornamental shrub, unsurpassed for gracefulness and beauty, is the Ceanothus, or as it is called by some, the wild lilac. One of these bears in early spring a profusion of fragrant, white blossoms; another follows later with a wealth of flowers of a lovely campanula blue, passing into flax-flower blue and fading with age to a delicate pearl blue. A shrubby Mimulus challenges attention in canyon and on mesa, sometimes with red, sometimes with salmon-colored flowers, sometimes with a mixture of the two on the same branch. This I have recently transplanted with ease and success, and can therefore fully recommend it to others.

Many have noticed the native climbing plants of Southern California—the Chilocothe vine, the personification of grace itself, with its delicate green and clusters of blossoms or ripening fruit; the wild Clematis, hanging from the trees along our watercourses in graceful festoons; the *Lathyrus splendens*, or "Pride of California," with its brilliant color. To have these and many other vines adorning the trees and shrubs in reckless abandon, would seem to the writer a pleasing innovation. Nature has set the example, and no method would seem better adapted for the advantageous display either of our native or cultivated flowering vines, which could thus be induced to largely care for themselves.

Last, but *not* least, I wish to enter a plea for a cactus garden. One of the most interesting features in a public park would be what is usually called an "Arizona garden." While the prickly pear and the Cholla may not seem desirable or ornamental to those who have had to contend against them in clearing land, yet to the average stranger there are few things that possess greater attraction. When we add to the prickly pear and the Cholla, the tuna, the Turk's head, the Old Man, and the, literally, thousand other varieties of cacti that are known, many furnishing useful products to man, others odd or curious, and the most of them bearing truly magnificent tropical flowers, what an attraction the despised cactus becomes. Could you secure a carload of these desert beauties (the principal expense would be the freight), our park would become a formidable rival in this respect to the collections at Del Monte and Menlo Park which have gained such notoriety.

One Farmer's Experience.

Speaking of the value of our market and crop reports, a farmer who has taken the paper for some years writes:

"I call to mind an article which appeared in the RURAL PRESS some time ago, wherein you advised farmers to sell their barley. I heeded the advice and made $100, and warned others, who told me that they made from $300 to $500 by selling at that time."

STOCKTON owes its prosperity to its position as the grain-distributor of the San Joaquin valley. It must be unusually prosperous now, as it is experiencing a wheat blockade, the levees and warehouses being full.

How Rats Are to Be Exterminated.

The best course to take when the extermination of a colony of rats becomes a necessity, is to make them help to destroy one another in the following manner: A number of tubs, proportionate to the quantity of rats in the place which it is desired to rid of them, should be placed about, the middle of each occupied by a brick standing on end. The bottom of these should be covered with water to such a depth that about an inch of the brick projects above it. The top of the tub should be covered with stout brown paper, upon which a dainty meal of bacon rind and other scraps dear to the rat palate figures, a sloping board giving the rodents facilities for partaking of it. The feast should be renewed for several nights, so that all the rats in the neighborhood may get to know of the good food which is placed within such easy reach. When it is judged that this policy has been pursued long enough, the center of the brown paper should be cut in such a manner that any rat venturing upon it will be precipitated into the water below. It might be thought that the result of this would be to capture a rat, or at the most two, for every tub prepared, but no such meager reward for the trouble that has been taken need be feared.

The first rat to find his trust abused and himself struggling in the water at the bottom of a tub, soon recovers sufficiently from the shock to ascertain that there is a little island of refuge, on to which he clambers and squeals his loudest for help. Now the squeal of a rat in trouble attracts every one of his kind within hearing, and very few moments will elapse before the victim of misplaced confidence is joined by one of his friends. The new-comer is as quick to discover the chance of escape from a watery grave that the brick offers as was the original victim, but when he attempts to avail himself of its presence it becomes apparent that there is not room for more than one upon it. The first-comer resists with tooth and nail the efforts of his companion in trouble to dispossess him of his coign of vantage, and the squeals which form an accompaniment to the fight for a footing upon the brick attract more rats to the scene of the tragedy. The conflict waxes more and more furious as rat after rat topples into the water, and by morning bedraggled corpses in plenty will gladden the eyes of the man whose losses at the teeth of rats have induced him to adopt this means of thinning their numbers. Some years ago the plan described above was tried in a city warehouse, with the result that more than 3000 rats were destroyed in a single night.—*The Cornhill Magazine.*

Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, *or beyond the time he intends to pay for it*, let him not fail to write us *direct* to stop it. A postal card (costing one cent only) will suffice. We will not knowingly send the paper to any one who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent. LOOK CAREFULLY AT THE LABEL ON YOUR PAPER.

For Sale.—Valuable land in Tulare county artesian belt. 160 acres, 1½ miles southwest of Tulare city; 480 acres, 7 miles southwest of Tulare, with large flowing artesian well, well-finished two-story horse, large barn, etc.; 160 acres, 2 miles southwest of the above; 480 acres 3 miles southwest of Pixley and about 4 from Alila. For sale by owner in lots to suit at low prices, low interest and very easy terms. For further information, address LAND OWNER, Box 2517, S. F., or A. T. DEWEY, No. 220 Market street, San Francisco, Cal.

Angora Goats at the Santa Clara Co. Fair.

One of the most interesting exhibits at the recent Santa Clara Co. Fair was that of C. P. Bailey's four pens of pure-bred Angora goats. The fact that Mohair has advanced in price fully 40 per cent over last year's prices has put new life in the "Mohair industry."

The bulk of Mr. Bailey's this year's clip of Mohair sold at 42 cents. None sold for less than 39 cents, and a small lot of pure-bred kid fleece was valued as high as 65 cents.

Mr. Bailey now has ready for sale about two hundred (200) head of fine young pure-bred bucks, and expects a greater demand for them this fall than ever before.

He has made a specialty of goat-breeding for the past 25 years, and is a most earnest and diligent promoter of the Mohair industry. He has sold nearly $70,000 worth of stock for breeding purposes, and still owns about 10,000 head, over 1000 of which are pure breeds. He has this year raised more Mohair than the combined product of any other four goat-raisers in the United States. His flocks richly deserve the popularity they have acquired.

CALL, INVESTIGATE, AND BE HAPPY.

It is said competition is the life of trade. Anyway it is death to high prices. Thus competition to be effective requires first, the goods offered must be at bottom prices and bottom prices necessitate low rates of invoices. Established in 1868, for 22 years, says Mr. Terry, we have followed this system. Our furniture, which is the best, both new and second-hand, from the advantages of our having cash capital at command, has been always offered at the lowest market rates and generally lower, our customers saving at least 20 per cent on their purchases. You can order as cheap by letter as though personally present. The finest line of rugs, carpets and furniture constantly on hand. Don't forget. Salesrooms 745 and 747 Market St. Jos. T. Terry & Co.

Let Us Know

If you fail to get this paper. We prefer to send missing Nos. Write soon and to the office direct. It is important that we should know when the paper miscarries.

DR. T. J. FRAZER, Dentist, Room 54, Flood Building, Market and Fourth Streets, San Francisco, Cal.

The Haines Gang Plows.

As the plowing season approaches it should be the business of every cultivator to note what improvements are being introduced by plow manufacturers and take advantage of the latest devices which commend themselves to experienced tillers of the soil. In this connection, the Haines Gang plows, which are offered by Stanton, Thomson & Co. of Sacramento, should be carefully examined. These Gang plows embrace a new principle of construction, consisting of a "fifth wheel" on the axle, which facilitates turning a corner and enables the plowman to turn without removing them from the ground, and with no side strain on the wheels. In other words, the beams are attached to a *fifth wheel*, which pivots on the axle, enabling the wheels and axle to swing in turning, like those of a wagon, thereby relieving the plow from much of the strain in turning, on both wheels and bottoms.

The engraving given herewith gives one style of these improved plows, and the advertisement of Stanton, Thomson & Co. upon another page of this issue shows other styles. The plows are adapted to various kinds of work and they are light and strong as steel and malleable iron can make them. They have imperial chilled or steel bottoms. The same carriage is used for two, three and four-gang plows, so that a two-gang plow can be changed to a three or four-gang by simply bolting on the extra beams and changing one bolt. This is an important feature with this gang, and one that will be appreciated by farmers, as they can have a two, three or four-gang riding plow for little more than the cost of an ordinary two-gang plow.

THE "TRIUMPH"

ALL METAL SPADING HARROW.

THE BEST PULVERIZER IN THE WORLD.

Just the Thing for Working Summer Fallow Land.

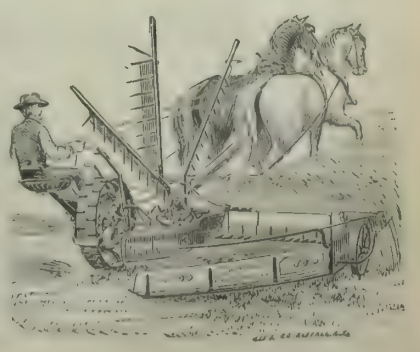
SPECIALLY ADAPTED FOR ORCHARDS AND VINEYARDS.

FOR TWO HORSES. Works the soil about six feet wide. Angle of teeth adjustable to work the soil at desired depth. THIS HARROW is something entirely new. IT IS THE GRANDEST ACHIEVEMENT of its inventor, C. LA DOW, who is the recognized authority on Harrows, there being but few leading Harrows at the present time not built under his patents. We have made exclusive arrangements for its sale and it can be obtained only through us or our agents.

THE NAME "SPADING" refers to its action on the soil. The action of each cutter is like that of a small spade, lifting and turning the soil from a depth of four to six inches, doing more perfect work than is possible with any other Harrow in the world. THE BLADES are made from spring steel, in operation vibrating and shaking off sticky soil. IT NEEDS NO SCRAPERS to clean the revolving cutters.

Considering the immense amount of labor done, the draft is very light, as the pulverized soil passes through the gangs of revolving cutters, being left smooth. THE GANGS are so arranged that the most uneven ground is thoroughly harrowed and left level. IT LEAVES NO FURROW or ridge; when the field is harrowed it is all left smooth.

THE TRIUMPH REAPER NO. 3.



While Binders to a large extent have superseded Reapers, and the sales of the latter with other houses have greatly decreased, our trade on the No. 3 Triumph Reaper has been growing steadily larger.

Each year, since the introduction of this Reaper, have our sales increased, and although our supply from the manufacturers has been larger every year, yet the demand has been so much greater than our expectations that many orders have had to go unfilled.

We are prepared this year to fill all orders promptly, and guarantee every Reaper to do first-class work under any circumstances.

Every Triumph Reaper now running in the State of California is giving entire satisfaction to the farmer owning it.

Special Reaper Circular sent on application.

STOCKTON, CAL.

THE VINEYARD.

Report on the Grape Interests of the Napa District.

The following is the report of E. C. Priber, just prepared for the Board of Viticultural Commissioners, of which he is a member for the Napa District:

It is not very gratifying for the Commissioner of the Napa District to make his annual report at a time when the conditions of the wine industry are so deplorable as they are at present, but it is with special pride that we can claim for this district that, with all the hard times, the low prices for wines and the terrible destruction by phylloxera, it shows wonderful improvement and has gained during the past few years a high reputation for the quality of both its wines and brandies.

The difficulty found in disposing of the young wines at a remunerative figure has forced many growers to hold their products, to buy the best oak cooperage and to build new cellars. This, as it may be called, forced retention of aged wines, has enabled them to seek and to find a profitable market with the consumers here and outside the State.

Napa county has improved immensely in its cellar facilities of nearly 500 growers. More than 100 make their own wines; about 50 of them have stone cellars, partly underground or tunneled. The total cooperage in the valley reaches ten million gallons.

While it is true that very little wine of Napa valley is offered on the San Francisco wholesale market at present, large quantities of the last three vintages are still held by the growers, who can give their product proper care and time to develop those qualities which will command a remunerative figure.

These terribly hard times have taught this lesson: That not all wines made are excellent, and not all can be judiciously aged, and thus learning to discriminate, the grower prefers to send all doubtful wine to the distillery to putting it on the market or to aging it, and by doing so injuring both his reputation and that of his district.

We have 35 registered distilleries in Napa county which have reported to the Internal Revenue Department 242 180 gallons of brandy from October 1, 1889, to August 1st this year. Quantities of this brandy have been shipped to Europe, where our Napa brandies have gained an excellent reputation.

The ravages of the phylloxera have been more noticeable than ever before. Only about ten per cent of the 15,000 acres are planted in resistant vines. The experience with the resistant vines in France, where the production is rapidly increasing in consequence of the replanting of those vineyards which were destroyed by the phylloxera, should teach us a lesson. It cannot be impressed too strongly upon our growers that the replacing of their diseased vines by Riparias is the only true salvation for their vineyards, and it might be advisable for our board to consider if our funds and the law which appropriates them would not permit the furnishing of Riparia roots to the wine-growers. We would also recommend to use all efforts in inducing the growers to pull out and burn all diseased vines, the present condition of affected vineyards in this State containing these destroyed vines making them hot-beds for the propagation of this plague. Experience has shown that where diseased vines have been pulled out and destroyed, the progress of the phylloxera has been comparatively slow.

This year's crop in Napa county will be smaller than that of '88 or '89. The shortage is caused mostly by the ravages of the phylloxera, and somewhat by coulure and sunburn. The Zinfandel, which is by far the most predominating grape, did not set as fully as usual, and will yield a light crop. The white grapes are looking very healthy and give promise of a bountiful crop.

Solano County

Is one of the few counties where table, raisin and wine grapes (suitable either for drying purposes or the manufacture of sweet or dry wines) are cultivated to perfection. This county has about 3000 acres in bearing, of which about 1000 acres are used for table grapes. The product of 500 acres is made into raisins, and 1500 acres are in wine grapes.

In the northern part, around Dixon, we have about 500 acres in grapes, nearly one-half of which are cultivated for raisins alone. The balance of the grapes will be dried this year; in fact, most of them are already contracted for. In former years a couple of hundred tons of grapes were sent from this neighborhood to the wineries at Cordelia, Napa City and San Francisco. No wines will be made in this locality the present year.

In the Vacaville section, including Pleasant valley, most of the grapes are sold for table use. The few vineyardists having wine grapes will dry the present crop. In Pleasant valley a great many vineyards are partly destroyed by phylloxera. Vineyards near Vacaville look healthy, are well taken care of and do not show much signs of phylloxera. They prove to be an excellent investment this year. Only a few small wineries exist here, the production of which does not figure largely in the grape market.

The vineyards around Cordelia, including Suisun, Fairfield, Benicia and Green valley, are planted solely to wine grapes. The climatic conditions do not favor raisin culture and scarcely permit the drying of their product. We have many wineries in this vicinity which, as the phylloxera has made considerable progress and has destroyed already hundreds of acres here, are fully able to handle the present crop, which looks very promising. Some grapes near Fairfield make very good sweet wines, but the larger part of the product of the wineries is light dry wines from grapes grown on the hills surrounding Green valley and the slopes near Benicia. Solano county may now have 200,000 gallons of wine in its different wineries and cellars, and will produce not more than 500,000 gallons this year.

Contra Costa County,

Which produces largely table grapes, lost a considerable portion of last year's crop by early rains. This year's crop is very promising. The wine production of the county may reach 400,000 gallons during the coming vintage.

The El Dorado District.

The following is the report of G. G. Blanchard, Commissioner for the El Dorado Viticultural District:

To the Board of State Viticultural Commissioners: For the purpose of better acquainting myself with the absolute condition of this branch of industry, I have quite recently made extensive visits into the counties of Yuba, Sutter, Nevada, Placer, Amador, Calaveras and Tuolumne; and have received reliable information in relation to the subject of viniculture in the counties of Mono, Inyo and Mariposa.

I am informed by the several assessors of the counties of Alpine, Plumas, Sierra and Mono that there are no grapes of any kind raised in those counties, except it may be a few experimental vines, planted more for experiment and curiosity than from any idea of profit.

Grape-raising—either for wine, table or raisins—in my district is principally confined to the counties of Placer, El Dorado, Amador and Calaveras. However, I have found some very fine specimens of raisins and fine qualities of wines produced in the counties of Nevada, Yuba and Tuolumne.

The raisins of Placer and El Dorado have long been known to the raisin market as superior in quality, those of Placer county having taken the first premium at the Citrus Fair, held in Sacramento in 1887.

El Dorado county having been the site of the discovery of gold in California, necessarily had attracted to it the earlier immigration to California, and to gold mining was added, at an early day in its history, that of viticultural pursuits, and the early vineyards were planted to what is known as the Mission grape. Probably some of the oldest vineyards in the State, outside of the Missions, are to be found in El Dorado county, planted when no other grape was known in the State except the Mission variety; and as the foreign vines became introduced into the State, they necessarily found their way into this county, so that to-day we have vineyards of the finest foreign varieties. The soil and climate, to an altitude of 2800 feet above the sea level, is found to be conducive to its growth to perfection. This adaptation of soil and climate is not confined to the growth to perfection of any one particular kind of grape, but extends to the whole family and species.

Except in the county of Placer, and there only to a limited extent, have vine pests of any kind affected the vineyards. The vines, from an altitude of 600 feet to that of 2800 feet above the sea level, have a uniformity of growth, healthfulness and producing qualities. Those of the higher altitudes contain much more of saccharine matter than those of the lower altitudes.

Those grapes cultivated for table use, such as the Tokay, Emperor, Rose of Peru and Muscat of Alexandria, obtain in the higher altitudes a greater degree of perfection in color, richness and consistency than those grown in the lower altitudes. The Flaming Tokay, at an altitude of 2000 feet, arrives at that peculiar color from which originated its sobriquet of "Flaming," and has that degree of fire brightness not to be found in those grown in the lower altitudes. The Muscat of Alexandria is relieved of that green appearance which it has in the valley counties, and possesses in the foothills a rich golden appearance, and it also has a more pronounced richness of the Muscat flavor.

In the counties of Yuba, Nevada, Placer, El Dorado, Amador and Tuolumne there is more or less wine of a very superior quality made. In Yuba there is a winery whose annual product runs into the hundreds of thousands of gallons, owned and operated by Mr. G. Sieber. At Nevada City there is also a winery, owned and operated by the Nevada County Wine Company, producing some ten or fifteen thousand gallons of wine annually. In El Dorado county there are several wineries, all producing a first-class quality of white wines, and some of their red wines command the highest price in the market.

The wines of Mr. George Sieber, both red, white, dry and sweet, will compare favorably with those of any other section of the State, and are the product, I was informed, of the grapes raised along the foothills back of Marysville. All the grapes converted into wine at the Nevada winery are raised in the higher altitudes of the grape-producing regions of Nevada and Placer counties, none of the grapes being raised at a less altitude than from 2000 to 3000 feet.

The grape-producing regions in my district will cover, from Yuba to Inyo counties, an area of from 20 to 30 miles in width by from 250 to 300 miles in length; and of all this vast region there is not a thousand acres but what is susceptible of producing the finest qualities of grapes of any variety, either for wine, raisin or table use.

Profit being the great desideratum of all industries, and especially those which require so much labor and expense as that of grape culture, wine and raisin making, the great distance to market, and an almost total want of facilities for transportation, has caused this industry, as to most of this vast area, to be neglected; for no matter how complete an adaptability there may be, both in soil and climatic condition in this region, unless the industry can be made profitable it will find but very few who will embark in it.

It is strange to observe, and yet true, that very little sulphur or other curative articles are used in any of the vineyards in these localities, there being no apparent need of its use, especially in the higher altitudes of the grape-growing regions.

On account of the distance from market and want of transportation facilities, very few new vineyards have been planted in the last year or two. In Placer county there has been a marked increase of acreage in the planting of vines in the last year, which on account of the facilities for transportation to market have been mostly table and raisin varieties.

Since the establishment of this commission, it is observable in all of the vine-growing localities of my district that there has been a constant increase in the cultivation of those superior varieties of foreign vines, both for wine and table use; and also through the advice and information in wine-making given to our wine-makers and viticulturists through our Chief Executive of Viticulture and Health Officer, there has been a most remarkable advancement in the art of wine-making and of grape culture generally.

At no distant date, when railroads shall have been extended so as to reach these grape-producing lands to such an extent as to afford facilities for cheap transportation, this whole region to which I have alluded will be one vast vineyard, giving employment to thousands of laborers and adding vastly to the wealth of California.

THE

PACIFIC RURAL PRESS.

Truly a Farm and Home Journal of the highest class, pure in tone and well informed on all matters of industrial interest.

All branches of Farming, including the keeping and breeding of Horses, Cattle, Sheep, Swine, Bees, Poultry, etc.; Garden, Fruit, Vine, Grain, and Hop Culture; Reliable Market Reports, with other important departments devoted to the Grange, Home Circle, News, etc.

It is the Leading Agricultural Home Newspaper and standard authority on all branches of California Agriculture.

Its illustrations are probably the most practical, original and helpful of any agricultural journal in the world.

It also contains more fresh and useful agricultural information for the readers of this coast, by far, than can be obtained through any other publication issued here or elsewhere.

Established by its present proprietors in 1870, with rare facilities for leading in its position, and securing the combined patronage of the most intelligent and thrifty husbandmen of this coast, where the soil, climate, and many other conditions, imperatively demanded a new agricultural literature.

These natural advantages, combined with liberal enterprise, strict and long-continued fidelity to the welfare of the farmers and their households, has given the RURAL an aggregation of patronage which places it far in advance of all competitors and which enables us to give much better issues at decidedly lower living rates, (to the advantage of both subscribers and publishers,) than would otherwise be possible.

A steady and leading advocate of the Grange cause from its first introduction on this coast, in 1873, the Grange edition of the RURAL has been endorsed as the OFFICAL WEEKLY ORGAN OF THE STATE GRANGE OF CALIFORNIA, and as successor to the weekly issues of the *California Patron* it is the leading Grange advocate for OREGON, WASHINGTON, IDAHO AND MONTANA TERRITORIES.

It has the fullest and most accurate REPORTS OF HORTICULTURAL MEETINGS, and is the best record of the EXPERIENCE OF INDIVIDUAL FARMERS AND FRUIT-GROWERS in all parts of the State.

Its market reports are prepared with care and the greatest reliability possible for the benefit of the producer.

THE PACIFIC RURAL PRESS has more circulation and influence in the Pacific States and Territories than all the other agricultural weeklies in the United States combined. Advertisers can reach nearly all the leading reading farmers through its columns.

A well-known horticulturist who was in attendance upon the meetings of fruit-growers, writes; "The greatest praise that could be bestowed on the RURAL PRESS at the late Fruit-Growers' Convention and, which shows, undoubtedly, the well-deserved popularity of that paper, is the fact that almost all the members of that Convention were subscribers to the Press."

Yearly subscription $3. [Fifteen months are allowed new subscribers and old subscribers paying $3, ten months for $2, five months for $1 and three months for 60 cents, paid strictly in advance.]

The Great Chautauqua Circle.

Founded in 1878, this Home-Reading Circle has grown to marvelous size. It has met with eager welcome from thousands who aspire to a broader life. The daily routine of cares and labor may be lightened by systematic reading of good books—a little every day. A Michigan farmer's wife writes: "Living on a farm too far from town to join a circle, I have so far read alone. Into my busy life the daily time allotted to my reading comes like a benediction." Should you not like to join this great company of readers? You may read alone or with a group of friends. Write to John H. Vincent, Drawer 194, Buffalo, N. Y., for full details and membership blanks.

California's Stallions.

I beg to announce that, with a view of perpetuating the forms and characteristics of the leading stallions of California, I am issuing a series of lithographic likenesses. Each portrait issued will be an acknowledged likeness, the result of a close study of the horse and an artistic treatment of the subject. In order to secure for the series an immense advertising value, from a breeder's point of view, 4000 copies, at least, of each portrait will be issued.

Terms, $100 for first issue of 100 copies. In quantity, for advertising purposes, copies will be furnished at low rates.

PUBLIC AFFAIRS.

Taxation No Treasury for Farmers.

EDITORS PRESS:—Mr. Brigham, the national head of the Grange, says that if the policy of protection is to prevail, the farmers should have their fair share. He has frequently expressed, in a cautious and conservative way, his doubts about the whole protective business. He, like all the thinking farmers, has no doubt about the fact that now it is the farmers who pay for protection and yet get none of it. His remedy is for the farmers to enter the lobbies of Congress to log-roll for public taxes for private profit.

While some among the farmers think well of such a plan, our Protectionist leaders have little hesitation in expressing their intimate belief that the farmer must save himself and not look to any relief from legislation.

Legislative favors are competent to combinations of capital in monopolies or manufactures, but no befriending of the farmer can be effective by laws and duties raising the price of his products.

Carnegie, the canny Scotsman, who is rolling up such a vast fortune by the aid of our protective laws, well expresses this view in an article in the July *North American*. He there indicates that the produce of the farmer is largely food; that when the amount of food produced in a country is insufficient, combination among the farmers and monopoly, by the aid of protective duties, become possible, and not otherwise.

As food increases in price the number of those who die from an inability to pay for enough to keep them alive, augments. Thus protective profits to the farmer must increase the death-rate from starvation. This result is inevitable. Laws and duties for the farmer's protection, when really effective to him, are as impossible of maintenance in this country today as they were in England in 1848. Any laws directly and visibly bringing the starvation line higher among the poor cannot be enforced in a free country. The Protectionist leaders know this perfectly, and in the duties nominally for us farmers they play upon our weakness and secure our support for their legislative favoritisms on the false pretense that we, too, have our fingers in the public purse.

The leading Protectionist paper of this end of the State is the Los Angeles *Times*. On Aug. 4th there was an editorial in that paper entitled "The Farmers and Self-Help." The article commences thus: "We are glad to see that some journals are beginning to preach self-help to the farmers. As long as the tillers of the soil place their trust in legislation to lift their feet out of the mire and the mortgages off their backs, they will make little progress."

The fact is that the farmers have had neither confidence nor relief from legislation. They have been the victims of legislation. They have seen railroads bonused and favored, bankers bonused and favored, infant industries bonused and favored, while they have furnished the bonus or been the prey of these law-favored few. The *Times* article has, however, a truth shining through it dimly. It is that the protectionists themselves do not expect to be able to help the farmers, admitting that they desired to do so.

The policy that the farmers should pursue is one of equal justice to all.

We cannot hope to profit by any policy of favoritism. In intrigues, combinations or monopolies we are at a disadvantage as against concentrated capitalists. In legislative matters we continuously see corporations or capitalists slip out of their public obligations, reduce or totally avoid their taxes, and by intrigue or bribery obtain by law favors, monopolies or bounties at the general expense. We farmers are not in a business easily aided in this way, nor are we so disposed to play the part of beggars or thieves. I do not mean to say that the farmers are saints, but I do say that what moral tone the nation has depends on the farmers for its existence and could not live without them. The farmer is therefore always at a disadvantage in intrigue or chicanery. His strength is truth.

The farmer may support the various schemes to increase the profits of special occupations, or protect them, as it is called, at his own expense; he may consent to the enrichment of others by public taxation, but he can never hope to employ the law as a means of filling his own pockets.

In public taxes, the cost of collection and the friction and waste are heavy, so much so that only a small minority can ever profit by public taxes for private use. The farmers, being a majority of the whole community, are consequently precluded from any expectation, as a class, of deriving benefit from such taxes; and here it may be said that it makes no difference in the result as to whether such taxes for private benefit are collected by the Government and distributed in bounties or collected by the favored few by public law, as is now done under the protective system. To use an expressive slang saying, "the farmer is not in it." Consequently the farmer, in considering the enormous burden he now bears of protective taxes, the injury of world commerce and of his markets for surplusage by this system, should estimate only the advantages a few proprietors of the Carnegie class are to be given.

To ask the farmer to enact public taxes for private profit on the pretense that he is to be enriched, is like asking an honest man to compound felony on the ground that he will be given by the thieves a fraction of property that they have stolen from him, or are to steal from him.

The farmer may consent to be robbed for others' enrichment, but he cannot be robbed to enrich himself. ABBOT KINNEY.

Santa Monica, Aug. 25, 1890.

FARMERS' INSTITUTES.

Institutes in Oregon.

[Written for the PRESS by PROF. H. T. FRENCH.]

Some two years ago the Board of Regents of the State Agricultural College voted to hold a series of Farmers' Institutes. The matter was brought up by E. B. McElroy, State Superintendent of Public Instruction, who was well acquainted with the benefits derived from Teachers' Institutes held throughout the State. The management and control of the Institutes was placed largely in the hands of the college professors. A certain amount was set apart from the college funds to defray the expenses of such meetings. Six Institutes were held in different parts of the State with a reasonable degree of success.

Last year six more were carried on with more success than the year previous, and so the outlook was encouraging.

This year a series of six more has been located in various parts of the State. The first one is at Grant's Pass on the 28th and 29th of August; the next at Union, Union county, Sept. 10th to 12th. It is usually the plan to have the Institute continue through two evenings and one day, but the people of Union have planned for seven sessions, taking three evenings and two days. The remainder of the Institutes have been located at McMinnville, The Dalles, Silverton and Junction City.

The expense of such meetings is not very great—simply the actual traveling expenses of those who go from the college, together with small bills for printing, and (sometimes) for the use of the hall where the meeting is held. Very often such accommodations are furnished by the community where the Institute is located.

Some of the objects of such meetings may be briefly stated as follows: To bring the farming and industrial classes into a closer communication with the college professors. There is apt to be a feeling that the professors are away above the common people; that "book-larnin'" has placed them on a high pinnacle, from which they look away off over the heads of the humble farmers. This, of course, is a false notion, and the way for us to weed it out is to get down and mingle with the class whom we seek to aid. The Institute is the best place in the world for this kind of work.

Another object, like that of all similar organizations, is to bring the farmers together in order that they may exchange ideas upon the questions which are of vital importance to them. This every one understands to be of great good, and it needs no further mention here.

Mr. J. H. Stevens writes, regarding the work of the Farmers' Institutes in Wisconsin, as follows: "I have no hesitation in saying that, in my judgment, Farmers' Institutes, as conducted by you in Wisconsin, are of more moment and fraught with more benefit to the farmers than any other educational system that could be adopted. These Institutes have already been the means of advancing Wisconsin to the front of all her sister States in progressive agriculture. It is fortunate that you have such men as ex-Governor Rusk and Governor Hoard to lend helping hands in the noble work."

In the State of Wisconsin, $12,000 is appropriated annually for Farmers' Institutes. In Michigan, only $400 is set apart for this work, and the result has been very satisfactory.

The State Legislatures should make special provision for this work, and not compel the college authorities to take it from the college fund.

Wherever a State Institute is held, a permanent organization should be formed, so that the seed sown may spring into life in the shape of a local Institute the following year. Some of the best Institutes I have ever attended were carried on by local talent. A Grange, or Farmers' Club, or any half-dozen live farmers who will lay their plans for such a meeting, will meet with success.

That there must be a *large* appropriation from the State or Government for such work, is a mistake. Of course the larger the sum to draw upon, the more meetings can be held; but it is better to start them on a smaller scale and then enlarge as the demand increases.

An Improved Fruit-Truck.

Our advance in orcharding has brought out many useful inventions. We give herewith engravings of McGarvin's patent fruit-truck, as manufactured by Smith McGarvin, corner of Montgomery and Alameda streets, San Jose. The features are so simple that the engravings tell their own story. Perhaps the most noticeable excellence is the patent combination in the gearing, which allows the truck to make the shortest possible turn around trees while loading fruit. The way this is done is seen in the small engraving in the lower corner. This style of gearing is used even on the lowest price trucks which are made. The higher priced ones have four springs the entire length of the axle, making it as comfortable to ride in as a spring wagon. The upper engraving shows these springs. McGarvin's is claimed to be the cheapest wagon on the coast. Its axles are said to be of the best Concord steel, and the springs oil-tempered, capable of carrying 3000 pounds.

LANGSHANS.—We wish to call the attention of our readers to the advertisement of Mr. W. E. Cornell, Des Moines, Iowa, breeder of pure-bred Langshans. A correspondent writes us that Mr. Cornell has some very fine specimens of this breed, and parties desiring to buy would do well to correspond with him, as he has a fine flock now ready for sale.

The Stockton Business College and Normal Institute.

Over a year ago we wrote that we did not wish to criticise our public schools, but that we believed our private schools, and especially our business colleges, were doing more for the public than public schools.

Take a school like the Stockton Business College. It has been established 16 years, but its growth for the past three years, and especially for the past year, has been a marvel to the State. Over 600 students have been in attendance during the past year, and the amount of work gone over and the general satisfaction given is almost incredible.

The principal, W. C. Ramsey, is a young man possessed of a great deal of push, executive ability, honesty and pleasing manners. In fact, he is the right man in the right place. His teachers are the best that can be obtained, for he pays such salaries that only men of merit can command. Their presence is a constant inspiration and example to those under their charge. Ten regular salaried teachers are to be found there every day.

One great feature of the school is its cheapness, and young men find that they can actually board, room and go to school there cheaper by far than they can get board alone for in most places in our State. Their charges are $18.75 per month for board, room and tuition by the year.

Mrs. Ramsey has charge of the dormitory of the school, and parents, however particular, need have no fear of sending their daughter or son, for they may rest assured that at all times they will receive the best of care and attention. Board is $10 per month and a furnished room $3. All of their rooms are heated by natural gas, and nothing more neat or convenient could well be devised.

Their course of study is much broader than most business colleges, for it includes not only all classes of business work and shorthand, but they train more teachers than any other private school in California. Over 70 of their students have passed the various county examinations and have received certificates to teach during the last eight months. One can hardly attend school there and not be filled with a desire to excel. They all seem to catch the inspiration.

The greater part of their students are young people who have earned their own money and have no time nor money to lose.

The school is indorsed by over one hundred of the business men of Stockton, for there is perhaps no other one institution in the city that is doing so much for the city.

The school occupies two entire buildings (see engraving of one in this issue), and is on a substantial basis, for it owns both of the buildings and they are fitted up as no other school in the State is fitted up. No pains, money nor time have been spared to make this school the leading school of the coast.

They now offer a choice of $25 cash or $50 scholarship to the person who will write the best essay on the subject:

"The value of a good practical education and the advantages offered by the Stockton Business College for securing the same."

We do not claim to be experts in school matters, but we hardly see how it is possible for any school to do more for those under its charge than the Stockton Business College.

Write to them for information, or what is better, call on them.

Mr. Ramsey says that "the time has come when a young man must either carry a good practical education or pack his blankets." Boys, take your choice.

The school is not on a visionary basis, but owns two immense buildings and occupies over 25,000 square feet of floor room. It excels all schools of the kind in the State in the number of teachers employed, the amount of room occupied, in the arrangement of its rooms, in the oversight over its pupils, in the advantages offered to those attending, in the cheapness of its expenses, in the number of students attending and the *Home Influence* given to all.

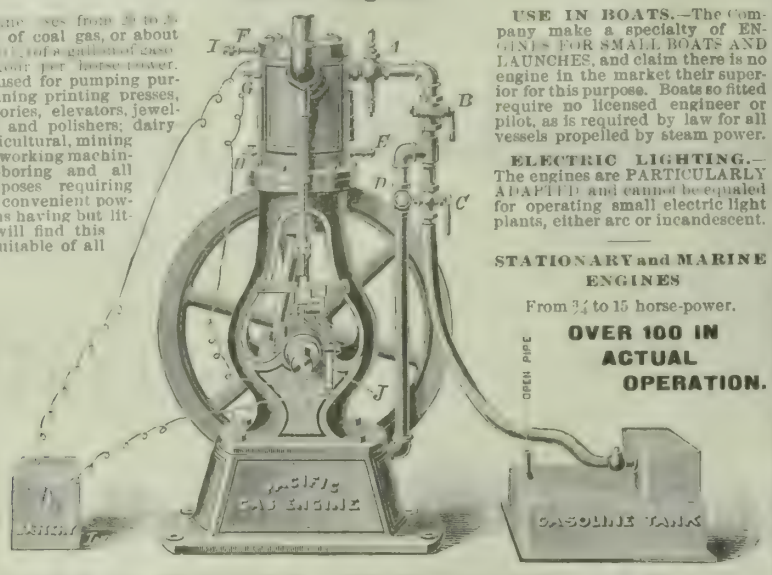
THE



PACIFIC GAS OR GASOLINE ENGINE.

PATENTED JUNE 17, 1890—NOS. 430,504, 430,505, 430,506.

Also in Great Britain and other foreign countries.

Starts Instantly Without the Necessity of Boiler, Fire or Experienced Engineer.

The engine uses from 20 to 25 cubic feet of coal gas, or about one-eighth of a gallon of gasoline per hour per horse-power. It can be used for pumping purposes, running printing presses, small factories, elevators, jewelers' lathes and polishers; dairymen's, agricultural, mining and wood-working machinery; well-boring and all other purposes requiring cheap and convenient power. Persons having but little space will find this the most suitable of all motors.

USE IN BOATS.—The Company make a specialty of ENGINES FOR SMALL BOATS AND LAUNCHES, and claim there is no engine in the market their superior for this purpose. Boats so fitted require no licensed engineer or pilot, as is required by law for all vessels propelled by steam power.

ELECTRIC LIGHTING.—The engines are PARTICULARLY ADAPTED and cannot be equaled for operating small electric light plants, either arc or incandescent.

STATIONARY and MARINE ENGINES

From ¾ to 15 horse-power.

OVER 100 IN ACTUAL OPERATION.

READ THESE TESTIMONIALS.

ALAMEDA, April 8, 1890

PACIFIC GAS ENGINE CO. GENTLEMEN: Permit me to add my testimonial to the many you have received indorsing your engine. As you are aware, mine was a Regan engine which gave me considerable trouble. I had to remove the head and raise the tapper valve every time I wanted to start the engine. I sent you the engine; you removed all the Regan appliance except the cylinder and stand. You put in your appliances, head, sparking device, inlet valve, and, in fact, changed it to the Pacific Gas Engine, which now works splendidly. I have not had to remove the head for any cause since you made the change (over two months). It gives me no trouble; my boy, 14 years old, attends to it.

The change from the Regan to the Pacific is a decided improvement. I can also get a third more power since the change, and I cheerfully recommend your engine as being simple, effective, and cheap. Respectfully yours,

B. S. HILL, S. W. Cor. Encinal Ave. and Morton St.

MAYFIELD, March 26, 1890.

PACIFIC GAS ENGINE CO.—We have given your little 1-H. P. engine a splendid advertisement. A fire broke out at 2:30 o'clock this morning, in a tenement house on my premises. I started the engine, connected the hose, and by its use saved at least $3000 worth of my property. I saved my blacksmith shop, lying 12 feet from the burning building, my barn and my dwelling. Three times the fire started in these buildings, and I extinguished it every time. The engine never faltered, and threw water between 50 and 60 feet high. The whole town was astonished, and they acknowledged that I saved at least $20,000 worth of property.

A fire department is being organized here, and I think they will have one of the engines on a truck for fire purposes. *[illegible]*

Hoping that all of your customers will be as well pleased with the engine as I am, I remain, Yours truly,

JOS P PONCE.

PACIFIC GAS ENGINE CO.,

SAN FRANCISCO, CAL.

A Substitute Race.

SACRAMENTO, Sept. 1.—At a meeting of the Executive Committee of the State Board of Agriculture to-day the matter of a substitute race for the 2.20 class was rearranged, and a trotting purse of $1200 offered, to be trotted for the first day, Sept. 11th, in place of the 2:22 class, in which the following named horses are eligible to entry, and such others whose records are not better than 2:23: Mary Lou, Wanda, Redwood, Pink, Guide, Oaknut, Argent, Larco, Nona Y. and Victor.

DENICKE'S FIGS.—Mr. M. Denicke of Fresno sends us a sample of his dried figs and asks what we think of them. We will answer frankly that they are exceedingly pretty, very light color and skin semi-transparent—as handsome a fig from an artistic point of view as we ever saw. The flavor, however, has been seriously impaired by the process employed in their preparation, and we suspect an oversulphuring. The flavor is not to be compared with that of Mr. Denicke's figs of last season, which, though somewhat darker color and perhaps tougher skinned, were vastly superior as an article for eating. This is the judgment of several whom we consulted and who have the memory of last year's figs by which to measure the impression made on the palate by the present sample. Of the comparative value commercially of the two products we do not attempt to judge.

Inducements to Subscribers.

To favor subscribers to this paper, and to induce new patrons to try our publication, we will furnish, *to those who pay fully one year in advance of date*, IF REQUESTED the following articles (while this notice continues), at the very greatly reduced figures named at the right:

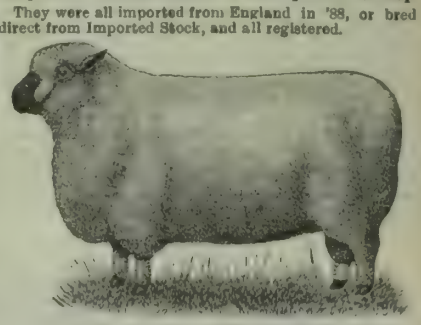
Red Polled Cattle.

We have 19 head of Imported Stock.

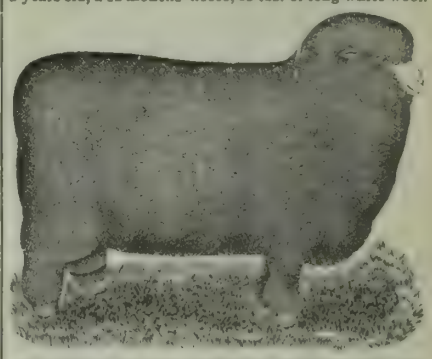


Young Bulls and Crossbreds on Devons for sale.

H. MECHAM,

Importer and Breeder of Shropshire Sheep

They were all imported from England in '88, or bred direct from Imported Stock, and all registered.



H. MECHAM,

—BREEDER OF—

American Merino Sheep Without Horns.

The only flock in the United States. When we bought our sheep East 20 years ago, among them was a ram without horns. He grew to be a large fine sheep, shearing at 2 years old, a 12 months' fleece, 36 lbs. of long white wool.

I have bred from him and his get ever since and have never made an out-cross and never used the same ram but one year on the same flock. My rams at 2 years old will weigh from 160 to 180 lbs.; have a strong constitution, without wrinkles, and will shear on an average about 25 lbs., a 12 months' fleece, of long white wool. Rams and Ewes for sale. P. O. Address:

Stony Point, Sonoma Co., Cal.

R. R. Station, Petaluma.

S. H. MARKET REPORT

Market Review.

DOMESTIC PRODUCE, ETC.

SAN FRANCISCO, Sept. 3, 1890.

General trade in farm products has continued quite active. With the expectation of large numbers of visitors being in the city the incoming week, there has been a quickened demand and better prices for dairy products. Green and dried fruits are still active at good prices. Hops have made another up move. Barley shaded off some, but recovered at the close. Wheat at the East and abroad has sold at lower prices. The following is to-day's cablegram:

LIVERPOOL, Sept. 3.—Wheat—Quiet but steady. California spot lots, 7s 5½d to 7s 8d; cargoes off coast, 38s 9d; just shipped, 38s 6d; nearly due, 38s 9d; cargoes off coast, slow; on passage rather easier; Mark Lane wheat, very little demand; English country markets, quieter.

Liverpool Wheat Market.

The following are the closing prices paid for wheat options per ctl. for the past week:

	Sept.	Oct.	Nov.	Dec.	Jan.
Thursday	7s8d	7s9d	7s9½d	7s10½d	7s10½d
Friday	7s8½d	7s9½d	7s9½d	7s10½d	7s10½d
Saturday	7s8½d	7s8½d	7s8½d	7s9½d	7s9d
Monday	7s7½d	7s8½d	7s8½d	7s9d	7s9d
Tuesday	7s7½d	7s8d	7s8½d	7s8½d	7s8½d

The following are the prices for California cargoes for off coast, nearly due and prompt shipments for the past week:

	O. C.	P. S.	N. D.	Market.
Thursday	38s9d	38s6d	38s9d	Firm.
Friday	38s9d	38s6d	38s9d	Inactive.
Saturday	38s9d	38s6d	38s9d	Firm.
Monday	38s9d	38s6d	38 9d	Slow.
Tuesday	38s9d	38s6d	38s9d	Quiet.

Eastern Grain Markets.

The following shows the closing prices of wheat in New York for the past week:

Day.	Sept.	Oct.	Nov.	Dec.	May.	June.
Thursday	106	106⅞		108½	...	...
Friday	105⅞	106⅝	....	108½	....	...
Saturday	104½	105⅝	106⅜	107⅝	....	...
Monday	....	....	....	....	....	...
Tuesday	104¼	105⅜	106⅛	107⅜	112¼	...

The closing prices for wheat have been as follows at Chicago for the past week:

Day.	Sept	Dec.	May	June.
Thursday	102½	....	109⅝	
Friday	102½	105⅝	109⅛	....
Saturday	....	104⅝	108⅝	....
Monday	103⅛	104⅜	...	....
Tuesday	....	104⅜	108⅜	....

NEW YORK, Sept. 3.—Wheat—$1.05¾ for cash, $1.03⅞ for September, $1.07⅞ for December, and $1.12¼ for May.

CHICAGO, Sept. 3.—Wheat—$1.05½ for December and $1.09½ for May.

Foreign Grain Review.

LONDON, Sept. 1.—The *Mark Lane Express*, in its review of the British grain trade for the past week, says: Offerings of new wheat are scarce; best whites are quoted at 42s. Old wheat is extremely scarce; the highest quotation is 40s. Foreign wheat advanced 6d. Flour has risen 6d. Corn is strong; mixed American has risen 1s. At to-day's market there were larger supplies of new wheat; the finest white was quoted at 40s. Foreign wheats were irregular; Californian advanced 6d and Indian 3d. Flour was slow. Oats were scarcer. Corn rose 6d.

Potato Blight.

LONDON, Sept. 1.—A reporter of the *Daily News*, who has been making a tour of Limerick, Waterford and parts of Cork, gives a deplorable account of the condition of the potato crop. He says the blight never before appeared so early.

Hops.

NEW YORK, Sept. 1.—Hops excited. All spot advanced. Brewers' and England's wants are urgent. State growers are alive to the position, and stand out for stiff prices. The stock of part of the engagements is going abroad freely. State, new, 40@45c. A carload of Pacific, new, was landed at 35c. Common to best States, 1889, 22@28c; Pacific, 25@27c; all 1888, 15@22c; old, 8@15c.

Mark Lane (London) *Express* reports as follows on Aug. 18th: Mold has been spreading most disastrously of late, and has now been succeeded by a gale of an extremely damaging character, inasmuch as the later descriptions of hop, now in brush and burr, have been so severely lashed that it is questionable whether they will develop into cone. Vermin also continue extremely numerous, and the combined adverse influences have sent some hundreds of acres irreparably to the bad. Nothing more than a very moderate crop can be secured, even should no further injury reduce the present prospects. Messrs. Wests, Jones & Co. report: There has been almost a total clearance of the 1889 growth, and a very considerable business has been transacted in old hops at a very material advance upon recent values, and prices keep very firm with an upward tendency. This year's crop on the continent of Europe will scarcely suffice for the home requirements. The yield in the Eastern States of America will be small, but the accounts from California are favorable.

NEW YORK, Aug. 28.—A Springfield man in the *New England Homestead* estimates a general shortage of 20 per cent in the hop crop of this country. He estimates the crop will be short 25 per cent in New York State; Massachusetts short 25 per cent; Wisconsin 40 per cent short, and California 10 per cent short. On these figures the shortage alone is sufficient to send prices up; but added to this is the fact that most of the old hops have passed out of the hands of the growers.

NEW YORK, Sept. 2.—The *Mail and Express* says that the present interest in the hop market exceeds anything known since 1882. Prices continue to bound upward, with no indications of a break for some time.

Manitoba Crops.

TORONTO (Ont.), Aug. 29.—The Manitoba and Northwest harvest is now probably beyond the reach of accident. The yield of grain and roots is such as was never surpassed and seldom equaled in any country. Four days ago the reaper commenced, and miles of grain was falling in bound sheaves from the reaper and binder. Of the crop around Moosejaw and Regina and all the way, "magnificent" is the word. The crop is light in the United States and elsewhere. Sixteen million dollars will come into Manitoba and the Northwest for wheat alone. How much Canada will get for oats and potatoes cannot be calculated, but it will get a good round sum. The $16,000,000 was calculated last evening with Mr. Whyte, general superintendent of the Canadian Pacific Railroad, the best railway man in Canada after Mr. Van Horn, and fully informed.

Eastern Wool Markets.

PHILADELPHIA, Aug. 29.—Wool is unchanged.

NEW YORK, Aug. 29.—Wool, steady; domestic fleece, 33@38c.

BOSTON, Aug. 29.—Territory wool has been active, selling at 58@60c scoured; 55@57c for fine medium and 53@55c for medium. California wool is quiet; choice spring is selling at 23@24c, and average wool at 17@20c. Western Oregon sold at 17@20c.

NEW YORK, Aug. 29.—*Bradstreet's* says: Values are firm in the wool markets with a fair demand. In view of the fact that a great deal of machinery is idle, and the worsted markets so overcrowded with English goods that domestic manufacturers are having a light season, their demands for stock are accordingly limited. At Boston, Ohio, and Michigan, wools are meeting with a restricted call, and Territory supplies are in moderate demand. Pulled wool has been selling well. There is inquiry for Australian stock. On the whole, there seems to be increasing confidence in a more active market during the autumn than the past six months have seen. Whatever changes in the situation have occurred of late rather favor sellers.

Local Markets.

BARLEY

	Buyer Season.		Seller 1890.		Buyer 1890.

BAGS—The market is barely steady for standard-sized grain bags. Outside holders offer to sell at 7⅜c.

BARLEY—The sample market after shading off has recovered, closing strong under a good demand. On Call, trading has been light. The bear contingent has been so badly demoralized in shorting the market, that few dare to sell short. The following are to-day's sales on Call:

Morning Session: Buyer 1890 — 300 tons, $1.36¼; 100, $1.36⅜; 100, $1.36¾; 500, $1.36½; 400, $1.36¼. Buyer season—200 tons, $1.42½; 100, $1.42 ₱ ctl. Afternoon Session: Buyer 1890 —400 tons, $1.35½; 500, $1.35⅜; 100, $1.35⅝. Buyer season—300 tons, $1.41⅞; 200, $1.41⅜; 100, $1.41¼; 600, $1.41; 100, $1.40¾; 200, $1.40⅞ ₱ ctl.

BUTTER—The local demand has been quite active, causing prices to appreciate. The increased demand is due to dealers and consumers expecting a larger consumption within the next ten days. Receipts from the East are increasing.

CHEESE—The market is firm, but no higher. The local demand is freer. Eastern receipts are larger.

EGGS—The market is higher and strong at the advance. Eastern are coming in quite freely.

FLOUR—The market is strong at full figures. Both the home and export demand are active.

WHEAT—The sample market has shown continued activity. Buyers, although quoting less here, are paying the high price of last week at many points in the interior. The exports of both wheat and flour since July 1st aggregate more than they did for the like time in 1889. In futures, trading has been fairly active at fluctuating prices. The following are the reported sales made on to-day's Call:

Morning Session: Buyer 1890 — 100 tons, $1.43⅜; 100, $1.43¾. Buyer season—5000 tons, $1.51½; 300, $1.51⅜; 300, $1.51¾ ₱ ctl. Afternoon Session: Buyer 1890 — 200 tons, $1.43¾; 1500, $1.42⅞; 1000, $1.42¾. Buyer season—1100 tons, $1.51; 500, $1.50¾; 600, $1.50⅞ ₱ ctl.

Cereals.

Mark Lane Express, Aug. 18: Harvest has been in active progress during the past week, but the temperature has fallen. There has been an increase in the rainfall, and the last three days have been a period of high winds. The reaping of corn already ripe has not been impeded, but the ripening of backward grain has not been greatly advanced. Sunshine records have been very variable; thus Lewes has enjoyed in 8 days 24 hours more sunshine than London. That this year's wheat crop will vary greatly, according to locality, is now admitted on all hands; but prospects have improved in the Midlands, and there is a full crop in the heaviest growing counties. The London market of Friday and the country markets of Saturday were largely absorbed in discussing what would eventually be the outturn of the British crop. The careful estimate published in the *Times* of Friday morning reckoned 72,105,000 bushels on 2,530,000 acres, or 2850 bushels to the acre, a better yield than in 1888 or 1886, but inferior to 1889, 1887, 1885 or 1884. In bulk the yield on this estimate will be smaller than in 1888, as a decline of 133,000 acres in the area is allowed for.

The Hungarian grain crops for 1890 are estimated as follows: Wheat yield, 18,994,000 qrs. on 7,450,000 acres; rye, 7,268,000 qrs. on 3,203,750 acres; barley, 6,237,000 qrs. on 2,640,000 acres; and oats, 5,262,000 qrs. on 2,645,650 acres. The new wheat proves disappointing in weight and quality.

The last estimate of the French crop puts the wheat yield as low as 35,250,000 qrs., in which case over 5,000,000 would require to be imported. The quantity of wheat and flour afloat with a British destination is still larger than in the two preceding years, but the difference is now small, not amounting in either case to a week's supply.

G. A. Abel, Grain Inspector of the San Francisco Produce Exchange Call Board Association, reports the stock of grain in city warehouses on September 1st as follows:

	June 1.	July 1.	Aug 1.	Sept. 1.
Wheat, tons	3,596	2,102	2,034	9,054
Barley	13,869	9,619	2,713	10,683
Oats	2,509	2,321	1,508	599
Corn	524	1,161	516	602
Bran	150	200	150	68

The quantity of wheat in the warehouses at Port Costa on the 1st was 116,000 tons, making a total of 125,054 tons in all Call Board warehouses, an increase of 51,161 tons during the month of August. A year ago there were 110,168 tons in Call Board warehouses, the increase for August last year being practically the same as this year.

The local wheat market has ruled weak so far as quotations are concerned, but actual transactions, with a few exceptions, have been made at last week's prices. The crop is unmistakably short, yet farmers have been free sellers, preferring to sell rather than take chances for better prices later on in the season. With lower bids, sellers, unless pressed for money, are offish, believing that better prices will obtain when more vessels arrive and charters recede. Buyers use the coal miners' strike in Australia as an argument against lower freights, forgetting that non-union miners are being put to work; besides, many coal vessels will be dispatched from England to this coast. It now looks as if we will have cheap freights toward the close of the year.

Eastern mail advices report that farmers are selling freely; this, no doubt, accounts for the advance in ocean freights from Atlantic seaports to Europe. With English farmers selling freely and American farmers free sellers, it is only a question of a short time when the selling pressure will abate and prices advance, for supplies do not accumulate to any great extent.

Barley has shaded off, more in sympathy with the decline in wheat than from any other cause. The crop is shorter than heretofore claimed, and as the consumption is larger the supply will be fed out before another season. For several years past the carryover from season to season has been quite large, but the carryover from the present season promises to be next to nothing. Oregon and Washington have a large crop, but the consumption up north is quite large.

The receipts of oats are fairly large, but stocks do not accumulate owing to free feeding, due largely to the higher cost of barley. The crop in this State and Oregon is said to be less than in 1889, but authentic information on the subject is difficult to get.

Corn has held to steady prices. Receipts and consumption are about the same. Crop prospects on this coast are not of the best, yet an increased acreage will offset in lessened yield to the acre. Crop advices from the Central States, while discouraging, are no worse than reported a fortnight ago.

Rye is offering quite freely. Buyers are offish unless offered concessions.

The Grain Standard Committee of the Produce Exchange has established the following standard for wheat, rye and barley crop of 1890:

	Pounds.
No. 1 White wheat	61
No. 1 Amber wheat	60½
No. 1 Sonora wheat	62½
No. 1 Rye	60
No. 1 Brewing barley	46
No. 2 Brewing	44
No. 1 Feed bright	41
No. 1 Feed dark	43
No. 2 Feed dark	40½
No. 1 Chevalier	53½
No. 2 Chevalier	51

Feedstuff.

Bran and middlings are selling for less money. Heavy receipts of the former with feeders holding off are against sellers. Ground barley and feed-meal are unchanged.

As heretofore indicated, hay is strong at an advance. The demand is good. The heavy fruit crop and more hauling, freighting and other work requiring teams causes a large consumption. Holders are not pressing sales. There were fewer grain-fields cut for hay this year than has been the case for several years past.

Fruits.

Berries are strong for all kinds, with blackberries and raspberries being about out of market. Huckleberries are steady.

In tree fruits, apples show more strength for choice good keepers, but poor are hard to place except at low prices. Bartlett pears are coming in sparingly, or, at least, good keepers are hard to get, and for such, good prices are paid. In some instances about 4¾c have been paid. Peaches are still higher. Canners readily pay 6c, while even a fraction more might be realized for a large straight parcel of choice. Plums are higher, with canners buying. Nectarines are unchanged. Grapes have a firm tone. Canners are buying Muscats at $25@40 a ton. Good-keeping table grapes are wanted to fill shipping orders. Wine grapes are selling at from $10 to $16 for Mission and Zinfandel.

Dried fruits continue firm. Shipments to the East are very heavy. It now looks as if the holidays will find very few in first hands. Driers' past experience has been that, four years out of five, to sell before the holidays is the best. Large jobbers in this city, who have not bought heavily, are now in the market. The market, in sacks is quotable as follows: Evaporated apples, boxes, 12½@13¾c; sliced, 8@10c; quartered, 7¼@9c; pitted plums, 10@12c; evaporated peaches, 18@21c; bleached apricots, sacks, 14@17c, boxes, 17@18c; white nectarines, 15@17c; red nectarines, 10@11c; California prunes, 9@11c; grapes, 3@3¾c, and an extra parcel might fetch 4c.

Raisins are steady, with a strong undertone. The market for October delivery is so low as to warrant the assertion that prices are more apt to advance than to decline. The East will have to buy quite freely. Dried grapes are still meeting with a good demand. Although the quantity dried will probably be double that of 1889, yet they will be marketed at good prices. This of course refers to the better selected and dried. Poor will be slow, even low prices will not induce much buying while better are to be had. For delivery in this and next month, London Layers are quoted at $2@2.25, with an advance on something very fancy. Loose Muscatels, $1.75@2. Poorer grades sell for less money. In the North, sales are reported at 4¼@6½c according to locality and quality.

Vegetables.

Cucumbers and tomatoes are weak, as are summer squash and egg plant. In other garden truck the market is steady.

Onions are slightly easier, but as the receipts are light any increased demand will cause prices to advance.

Potatoes are steady. Receipts are large, but then the demand is also large. Stocks do not appear to accumulate.

Live-stock.

The market for dressed cattle is quoted as follows [to obtain the price on foot, take off from the price for stall-fed one-third to one-half, according to the nature of the feed and time fed; and for grass-fed take off the price from 40 to 60 per cent]:

HOGS—On foot, light grain fed, 4¼@4½c ₱ lb; dressed, 7¼@8½c ₱ lb.; heavy, 3½@4c ₱ lb.; dressed, 5¾@6½c ₱ lb. Stock hogs, 4¼@4½c ₱ lb

BEEF—Stall fed, 6½@—c ₱ lb.; grass fed, extra, 6@—c ₱ lb.; first quality, 5¼@5½c ₱ lb.; second quality 4¼@5c ₱ lb.; third quality, 4c@— ₱ lb.; bulls and thin cows, 2@3c ₱ lb.

VEAL—Small, 6@8c ₱ lb.; large, 4@6c.

MUTTON—Wethers, 6½@7½c ₱ lb.; ewes, 6@6½c ₱ lb.; lamb, spring, 8@9c.

Miscellaneous.

Poultry has held to fairly firm prices. Turkeys are higher.

Honey is meeting with a better inquiry. The past week a fair shipment was made to France.

Nuts have a strong tone. The demand promises to be good.

Bacon, hams and lard are strong; particularly the first two.

Hops are booming. In first hands there is very little, owing to growers having sold freely on the up move—from 16c to 25c.

Wool is without essential change. The stock here is not large considering the condition of the market. The markets for goods at the East are overstocked, and until the surplus is worked off, there will not be much of or any improvement in the price of wool.

Exports by sea the past week aggregate as follows: Wheat ctls, Cork, 47,736; Liverpool, 80,375. Flour bbls, Sligo (Ireland), 20,139; Central America, 472; Tahiti, 874. Barley ctls, Tahiti, 288. Honey cases, Havre, 200.

From the *Commercial News* of Sept. 3d the following summary of tonnage movement is compiled:

	1890.	1889.
On the way to this port	278,071	226,347
On the way to neighboring ports	23,841	20,181
In port, disengaged	7 634	28,104
In port, engaged for wheat	48,283	63,693
Totals	357,829	338,325

To get the carrying capacity, add 65 per cent to the registered tons as given above.

From July 1, 1890, to Aug. 27, 1890, the following are the exports from this port:

	1890.	1889.
Wheat, ctls	1,820,185	1,817,527
Flour, bbls	183,551	177,076
Barley	41,621	166,517

Domestic Produce.

Extra choice in good packages fetch an advance on top quotations, while very poor grades sell less than the lower quotations.

California Fruits East.

NEW YORK, Aug. 29.—Sgobel & Day, agents of the California Fruit Union, sold two refrigerator cars of California fruit as follows: Bartlett pears, $2.60@3 40; Kelsey Japan plums, $2.65 ₱ half crate; Gros prunes, half crate, $1.10@1.85; full crate, $3.45@3.50; assorted peaches, $1@2. Bartlett pears had commenced to yellow up, but the peaches were mostly green and undesirable.

CHICAGO, Aug. 28.—The Earl Fruit Co. realized the following prices for California fruits to-day: Beurre Clairgeau pears, $2 35; Duchess pears, $2.05; peaches, $1.45@1.85; Tokay grapes, half crates, $2.25@2.55; Muscats, half crates, $1.15@1.40; White Malagas, $1.30; German prunes, $1.50. Passenger cars are two days late and the fruit is mostly in poor condition.

CHICAGO, Aug. 29.—The Earl Fruit Co. sold California fruit at auction to-day as follows: Bartlett pears, ripe, $2.15@2.55; Fallenburg plums, $1.70; Gros prunes, $1.85; Yellow Egg plums, $1.40 @1.65; Orange Cling peaches, $1.65@2; Mokevitt, $1.60; Susquehanna peaches, $1.05; some ice-water wet, $1.15@1.40; half crates Tokay grapes, $2.45@ 3.10; some in poor order, $1.45@2.10; half crates Muscatel grapes, $1.20@1.35; White Malaga grapes, $1.10@1.15.

CHICAGO, Aug. 30.—Porter Bros. Co. sold 8 carloads of California fruit to-day as follows: Bartlett pears, $2.45@3.30; half-crates Tokay grapes, $1.40 @2; Gros prunes, $1.60@1.85; Orange Cling peaches, $1.50@1.70; Early Crawford peaches, $1@ 1.65; Susquehanna peaches, $1.50@1.70; half crates Muscat grapes, $1.@1.25.

NEW YORK, Aug. 30.—A private cablegram gives information that the market for French prunes at Bordeaux opened with firm offers for sizes at 40 francs, with an eager demand and with the market poorly supplied.

CHICAGO, Sept. 1.—Porter Bros. Co. sold five carlcads of California fruit to-day as follows: Bartlett pears, ripe, $2.40@3; Beurre Bosc, $2@2.50; Duchess pears, $2.45; Beurre Clairgeau, $2.45; Orange Cling peaches, $1.35@1.95; Early Crawford peaches, $1.30@1.85; Susquehanna peaches, $1.50@1.85; half crates Muscat grapes, $1@1.35; half crates Tokay grapes, $1.65@2.85; full crates Muscat grapes, $2.40@2.85; Egg plums, 60c@ $1.65; Gros prunes, $1.90@2.20; half crates, Rose de Peru, $1@1.25.

NEW YORK, Sept. 1.—Fresh fruit had good weather. A steady sale of all lots in good condition. One firm sold by auction 46 cars Bartlett pears, $2.65@3.50; boxes of numerous straight lines, making above $3; half boxes, $1.25@1.65; Beurre Hardy, $2.35@2.50; other, $2.05; peaches, $1.30@ 2.55; Egg plums, $1.40@1.75; other, $1.20@1.65; Gros prunes, $1.45@2.05; other, $1.30@1.85; Tokay grapes, $1.10; double, $1.95@2.90; single Muscat, $1.30@1.70; double, $2.85; other, 90c@ $1.75; Red nectarines, $1.65@2.20. The California Fruit Union sold eight cars of Bartletts at $1.75@ 3.55, and Beurre Clairgeau at $2.40; peaches, $2.15 @2.50; some rather green, $1@1.05; Japan plums, $2.65; others, $1.55@1.60; Gros prunes, $2.20@ 2.50, full crates; $1.10@1.85, half; Muscat grapes, $2.25@2.85, full crates; $1.35@1.60, half; Tokays, $2.90@3.50, full; $1.75@1.80, half. Six private cars made full rates. The apricot situation is somewhat mixed. Enough here to fill present orders, and early coast purchases enable owners to shade the rates, while the invoices from other cities are pressed on this market. Canned goods are strong. Six thousand cases of peaches were bought in England and resold here at a good profit.

NEW YORK, Sept. 1.—Raisins quiet. Prunes somewhat unsettled. The actual sale of the French at 8⅛@8⅝c, 60 to 90 sizes, causes some comment, though it is generally known the French product contracts are small. Established prime California, however, are still quoted at 13½@14½c, forties to sixties.

CHICAGO, Sept. 2.—The Earl Fruit Co. sold six cars of California fruit to-day as follows: Bartlett pears, $3.90@3.95; Beurre Hardy, $2.05@2.20; Beurre Clairgeau, $2.35, over-ripe wormy ones sold for less; Duchess, $2.05; Onondaga, $2.30; Late Crawford peaches, $1.60; Clings, $1.75; Foster. $1.50; Susquehanna, $1.55@2; Gros prunes, $1.75@ 2.05; a few at $1.65; German $1.60; grapes, half-crates, Muscat, $1.15@1.25; Tokay, $1.40@2; Black Morocco, $1.80.

CHICAGO, Sept. 2.—Porter Bros. sold 11 carloads of California fruit to-day as follows: Grapes, half-crates, Muscat, $1.10@1.35; Tokay, $1.40@2.50; Rose de Peru, 90c@$1.25; Bartlett pears, $2.90@ 3.90; Beurre Hardy, $2.70; Beurre Clairgeau, $2.70; Howell, $2.70@2.75; Duchess, $2.75; Fallenberg plums, $1.25@1.40; Golden Drop, $1.75; peaches, Early Crawford, $1.50@1.65; Susquehanna, $1.50@ 1.80; Galway, $1.65; Orange Cling, $1.50@1.70; German prunes, $1.60.

NEW YORK, Sept. 2.—Indications that this will be a great all-round horticultural year for California continue to offer in this and foreign markets. French prunes, which could have been purchased in Bordeaux in April at 27f, opened last week regularly at 40f. Now there has been another advance in the Bordeaux market. Two offers of 41f have been refused. A private cablegram says fruit sold at 42@43f, and the Bordeaux market is greatly excited. Meantime, according to the *Commercial Bulletin*, the course of the market for California prunes indicates very clearly that many in the trade believe consumers will take the goods regardless of the point to which the price may be forced. The crop has been sold and resold, and at steadily advancing prices, until to-day it is difficult to obtain firm offers for additional quantities, and this too in the face of the fact that the crop has not commenced to move freely.

NEW YORK, Sept. 3.—E. L. Goodsell yesterday auctioned off ten cars of California fruit for account of the Earl Fruit Co., Sacramento, at the following prices: Bartlett pears, $3.20@3.30; ripe, $2.30@ 2.60; Boussock, $1.80@2.30; late Crawford peaches, $2.15; Cling, $1.25@2.37; Muscat grapes, single crates, $1.15@1.70; double, $2 60; Tokay, single, $2 @3; double, $4.45@5; French prunes, $1.60; Gros, $1.65@1.90; Silver, $1.40@1.80; Egg plums, $1.25 @1.80; Nectarines, $2.85.

THE old town of Monterey has begun to adopt some modern improvements.

The Whole Country Needs Fertilization

PUBLIC ATTENTION

Is called to the following letter from Professor Palmer to R. B. Cunningham, Agent of the Mexican Phosphate and Sulphur Co. at Guaymas. Mr. Palmer has been connected with the Smithsonian Institute for over 30 years:

GUAYMAS SONORA, MEXICO, January 9, 1890.

R. B. CUNNINGHAM, ESQ.—DEAR SIR: In answer to your communication regarding localities likely to furnish a market for Guano, I would state that in my opinion the whole of Southern California will furnish a market for your Fertilizer.

The Vineyards are troubled with a disease in the sap of the plant (or circulation). The cause of this disease has not been found out, but it is a fact, witnessed in animals and vegetables, that most diseases manifest themselves more readily when the animal or plant has not the proper food.

It is my opinion that by applying a liberal quantity of Guano to the Vineyards the disease will be suppressed. The remedy must be administered through the means of the soil, the disease being in the interior of the plant which is controlled entirely by what is derived from the soil.

If the said disease was on the outside of the leaves, stems, or roots, then the remedy would be external only. Experiments with Chemicals have failed, so far as I am aware of, to exterminate the disease.

Why not try a Fertilizer as a remedy? It will strengthen the living plants to withstand disease, and may be relied upon as a cure in the diseased plants, the remedy for which must be one that will change the constituents of the plant fluid which impart healthy life.

Southern California also requires a Fertilizer for her Orange Groves and Fruit Orchards. The Public Press and the Fruit Growers assert this fact that they must resort to Fertilization at once. This was proven to my mind on visiting Southern California last year. Trees, like grain, as the crops are gathered, remove from the soil its strength, and in order to continue the ability to produce a healthy and abundant crop, you must convey to the soil a competent supply of Fertilizer, and that section has no means of producing the desired supply from its domestic animals. Yours respectfully, [Signed] EDWARD PALMER.

THE MEXICAN PHOSPHATE SULPHUR CO.

Manufacture three grades of this Superior Fertilizer of the following analyses:

GUARANTEED ANALYSIS.	Brand [A] for Sugar Cane, Sugar Beets, Etc.	Brand [B] for Grain, Gardens, Lawns, etc.	Brand [C] for Fruits, Vineyards, Etc.
Phosphoric Acid	10 to 11 per cent.	15 per cent.	12 per cent.
Potash	9 to 10 "	2 "	5 to 6 "
Ammonia	3 to 4 "	2 "	3 to 4 "

And will sell in lots to suit.

PARTICULARS AND CIRCULARS MAY BE HAD OF THE UNDERSIGNED.

Notices of Recent Patents.

Among the patents recently secured through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

VEHICLE [illegible]—Geo. A. Stom, Golden Gate, Alameda Co. No. 432,150. Dated July 15, 1890. This vehicle running-gear consists of a series of elastic springs connecting the front and rear axles, and so disposed as to allow the front axle to be turned without the interposition of a bolster or fifth-wheel.

WINDMILL.—Orin W. Parker, Oakland. No. 432,146. Dated July 15, 1890. This patent covers certain details of construction in connection with the regulating apparatus for relieving the wheel in case of too much wind.

[illegible] TRAIN SIGNAL.—Albert W. Reppy, Oakland, assignor of one-half to T. C. Masteller. No. 433,216. Dated July 29, 1890. This invention relates to that class of train-signaling apparatus in which a normally closed electric main current is employed in connection with one or more local circuits in the several cars and engines of the train, said local circuits, including an alarm, being normally inoperative or open but adapted to be closed and brought into action by the breaking or opening from any cause of the main circuit. The object of this invention is to provide a simple and effective apparatus of this class adapted to be called into action in any possible contingency, particularly upon the breakage of any portion of the train, the derailment of any of its wheels, or the will of any passenger, train-man or engineer.

SPRING PRESSER FOOT FOR SEWING MACHINES. Crapo Leak, S. F., assignor of three-fourths to Mondula Leak and D. V. B. Henarie. No. 433,130. Dated July 29, 1890. This invention relates to certain improvements in pre ser-feet for sewing machines. The advantage of the device is very great, especially in sewing kid, leather, cloth, or goods of any description where seams lap or varying thicknesses of material occur in the line of stitching.

WHEEL.—Daniel Best, San Leandro. No. 433,193. Dated July 29, 1890. This invention relates generally to the class of vehicle wheels, and especially to those wheels which are to be esed with very heavy vehicles, such as traction ungines or road locomotives and other heavy implements. The object of the invention is to provide a construction which will permit the ready attachment of the spokes to the hubs and their removal therefrom when necessary.

GAME.—Dormer Walsh, S. F., assignor to F. H. Manker. No. 433,110. Dated July 29, 1890. This game or toy consists of an inclosed table having a smaller movable table fixed in it with the upper surface flush with that of the main table, a means for giving an impulse to the movable table and a series of marked or numbered pieces which are assembled upon the moving table and afterward projected therefrom, and an opening in the main table designed to receive some one of the marked disks which are projected from the movable table and to expose the number or mark thereon. Various games may be played with this device, the object being in each case to scatter the movable disks about the surface of the main table and to place one of them within the observation opening.

PROCESS OF AGING WINE.—Geo. H. Malter, S. F. No. 433,131. Dated July 29, 1890. This is a peculiar method of aging wine, by which the valuable aromatic and delicate flavors from wine vapors are introduced into the wine being aged.

TRACTION ENGINE.—Jerome B. Harris, Stockton, assignor of one-half to John Gambetti. No. 434,131. Dated Aug. 12, 1890. This patent covers an improved form of driving mechanism for traction engines. The object is to so arrange the driving mechanism that when called into action, and while operating, the dead weight of the frame and the carried parts is transferred from the axis of the carrying or driving wheels to a point outside of, or beyond said axis, and near the wheel's rim, whereby said weight is utilized to assist the positive power in turning or driving the wheels. By the construction employed, when the machine is starting and advancing it has not only the positive driving power of the engine, but also a supplementary power constantly acting and due to the weight of the machine bearing down on the wheel near its rim.

[illegible] DRAPERS.—Wm. M. Nelson, Traver, Tulare Co. No. 434,565. Dated Aug. 19, 1890. This invention relates to the general class of drapers or belts for agricultural implements of any nature, and it consists in the novel construction and combination of parts, the object of which is to accomplish the double purpose of protecting the ends of the draper-slats or sticks by preventing them from splitting, and of guarding the rivets which hold the sticks to the belts and preventing them from wearing loose and dropping out.

Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, *or beyond the time he intends to pay for it*, let him not fail to write us *direct* to stop it. A postal card (costing one cent only) will suffice. We will not knowingly send the paper to any one who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent. LOOK CAREFULLY AT THE LABEL ON YOUR PAPER.

BUGGIES, Buckboards, Spring Wagons, Surreys and Road Carts. Write for our new catalogue. Baker & Hamilton, San Francisco and Sacramento.

Vol. XL.—No. 11. SAN FRANCISCO, SATURDAY, SEPTEMBER 13, 1890. DEWEY & CO., Publishers, Office, 220 Market St.

Cerro Alegre Rancho Holsteins.

Our leading engraving gives representative portraits from the Holstein-Friesian herd of Geo. B. Polhemus of Coyote, Santa Clara county, which is rated as now standing at the head of the Holstein-Friesian interest of this State. The animals, as depicted by the artist from recent photographs, are eloquent exponents of the dairy points upon which the breed is advancing so rapidly in popular esteem and patronage.

The bull shown in the background is a grand

THOROUGHBRED HOLSTEIN-FRIESIANS, OWNED BY GEORGE P. POLHEMUS, OF SANTA CLARA COUNTY.

animal and stands at the head of the Cerro Alegre herd. He is King Aaggie Clothilde, born May 14, 1888, Reg. No. 10152, H. F. H. B. The six nearest female ancestors of this bull have butter records that average 22 pounds 5¼ ounces of butter in a week, and his eight nearest female ancestors average 16,617 pounds 6 ounces of milk in a year. Very few bulls ever known can show such average records for so large a number of ancestors. His breeding comprises the richest strains yet known to Holstein breeders. His sire is the highest-priced bull of this breed in the world. His dam is considered one of the best of the Aaggie family. He is a magnificent individual, with unusually fine head, splendid skin, good neck, excellent chest, broad, fine loin, straight, broad, lengthy rump, deep, broad quarter and elegant escutcheon.

The cows shown by the artist are fit companions for the king of the Aaggie and Clothilde families. Geeat Van Diepen (6018 H. H. B.; Advanced Registry 860) was imported from Holland April 21, 1884, being then a yearling. Her milk test began March 21, 1889, and closed Jan. 17, 1890, during which period she produced 12,188 lbs. 11½ ozs. milk. A second test began May 5, 1890, and up to June 30, 1890, she produced 3890 lbs. 15½ ozs.—an average of nearly 70 lbs. per day. One day's milking was 79 lbs. 12 ozs.

The other cow is Fansje 2d (9052 H. H. B.; A. R. 613), whose dam Fansje is 614 of the Advanced Register, was calved Feb. 28, 1886. She began her first test for Advanced Registry July 10, 1888. She made a ten-day record of 421 lbs. 3½ ozs. A later ten-day test, eight months after calving, began Feb. 22, 1889, and she made a record of 227 lbs. 2 ozs., which placed her on the Advanced Register, the first from this State. She began her three-year record May 11, 1889, closing May 10, 1890, with a record for the year of 13,923 lbs. 14½ ozs. One day's milking was 61 lbs. 5 ozs. as a three-year old. She dropped a heifer calf, sire King Aaggie Clothilde, August 18, 1890.

The Cerro Alegre herd has many notable animals besides those pictured by the article. One of its members, Rebecca Eymond, won the State milking contest of 1889 at Sacramento, and her record under great disadvantages was the largest ever made in our public tests. At Santa Clara County Fair, 1889, the same cow won the one-day milk contest open to all breeds, and at the same county fair, 1890, five members of the herd stood first, second, third, fourth and fifth in a test open to all breeds, the five cows averaging over seven gallons of milk per cow.

Visitors at the State Fair now in progress can learn by observation of the character and deeds of Mr. Polhemus' Holstein-Friesians. They will bear the closest study.

Oregon State Fair.

The Constitution of the Oregon State Agricultural Society ordains that the society shall hold a fair and stock show every year, beginning on the third Monday of September and continuing through the week. As the month came in on Monday, the opening of this year's fair at Salem next week falls upon the earliest possible date—the 15th.

The speed program and conditions as to the races appeared in the RURAL for August 16th, and our readers have been well advised of the fact that the cash premiums offered for agricultural, stock and mechanical exhibits, works of art, fancy-work and speed-trials amount to over $15,000.

The premiums on horses range as high as $30 in the thoroughbred, standard trotting, all-work and roadster classes, and $22 on Percheron, English shire, Clydesdale, graded draft, farm and carriage horses, and jacks, jennies and mules.

In cattle the best Shorthorn, Devon, Hereford, Ayrshire, Jersey, Holstein, Angus, Red Polled, and Guernsey bulls and cows may each win $37, and there is a host of lesser premiums, besides specials of $30 for herds of each class, and the best milch cow of any breed, to which L. K. Cogswell of Chehalis adds a $50 silver pitcher for the exhibition of the best yearling Red Polled bull calved in Oregon or Washington and shown at Oregon State Fair.

In the ten classes of sheep and the Angora goats, prizes range downward from $9 for pure-bred and $7.50 for grades, besides which a special of $100 is offered for the best ram of any breed or age for wool and mutton. Swine, six classes, have the same $9 limit, while the best trios of more than 90 varieties of turkeys, geese, ducks, fowls and pigeons may each win $2.

Coming to farm products, we find $10 premiums for best displays in sheaves of winter and spring wheat, oats and meadow grass respectively, and numerous prizes of $5 each for samples of thrashed grain of named varieties.

The dairy receives handsome recognition in prizes of $10 and $15 in each of four butter classes and $25 for best cheese.

The premiums for fruit are considerable; for floral exhibits, liberal; and for vegetables, sufficient to stimulate competition.

We hope the exhibits will prove varied, fine, ample and instructive; the competition at once lively and kindly; the visitors many and appreciative, and the whole affair a pleasing and profitable success.

CORRESPONDENCE

Correspondents are alone responsible for their opinions.

Is It Chance?

EDITORS PRESS:—Most persons have probably noticed that when hops, morning-glories, beans and other vines are growing they twine around the poles, cords, trees or whatever supports them in their upward growth; but we would like to know how many can answer readily whether they always twine the same way, and if so, which way?

After many years of careful observation, we are inclined to the belief that there is some influence which guides them in this respect so that they invariably twine in the same direction, and that direction cannot be easily reversed, for we have often tried the experiment with vines which had started up a pole by unwinding them, turning them in the opposite course and fastening them in place. To our surprise they would invariably start above the fastening and twine the way they had first commenced.

In the oak and chestnut forests of Pennsylvania, one can find large numbers of tall trees, especially chestnut, which have been struck by lightning, the scars showing that the electric fluid in running from the top to the bottom has followed the grain of the timber, which is often very winding. Our observation goes to show that these windings follow the same course as do vines on poles.

We have often noticed that hawks, buzzards and other birds which ascend to great hights by circling round and round, without any flapping of the wings, or by what some term sailing, circle in the same direction as vines twine.

Pigeons, when being taught as carriers, are often placed in boxes and taken on board the cars some distance from their homes. When liberated they will fly around in different directions for a time and then rise to a considerable hight by circling in the same direction as climbers before starting on their return trip.

Hunters and others traveling in dense forests are often bewildered and lost, and in their endeavors to find their way out they have resolved as a final effort to pursue a straight line in one direction, when, to their surprise, they would soon cross their former tracks, showing that, instead of traveling in a "bee-line" they had been circling. Frequently, when the ground has been covered with snow, their tracks could be traced, and it has been found that their circling was in the same direction as that of others herein described.

As far as our experience has taught us, cyclones and waterspouts also circle in the same course, consequently the more we investigate the more firmly we are convinced that there must be some universal law governing this circling motion—a motion which we find to be what is termed back-handed or against the sun.

IRA S. THOMSON.

National City, Cal.

El Cajon Fair Notes.

EDITORS PRESS:—The second annual fair of the El Cajon district took place Aug. 28th–29th, in the large and commodious packing-house of the El Cajon Vineyard Co. This fair is held solely as a horticultural exhibition of the products of El Cajon and adjacent valleys, gives no premiums and charges no admission.

Being in a raisin district, the display of grapes is naturally the leading feature, but in addition to the Muscats, Malagas, Fiher-Zigos, Sultanas and Zantes, were to be seen many wine and table grapes, such as Catawba, Cornichon, Mission, Verdel, Morocco, Tokay, Sweetwater and Rose of Peru. Although there were many other sorts whose names I cannot now recall, these will give some notion of the varieties displayed.

Among the finest exhibits was that of Major Levi Chase, who showed grapes in almost endless quantity and variety; also apples, pears, peaches, plums, prunes and almonds, several samples of evaporated peaches and apricots and a box of beautiful prunes, which, disdaining to take a European name, were branded simply "El Cajon Prunes."

Near this exhibit was that of H. S. Richards' Ricardia ranch, including a splendid display of raisin and table grapes, peaches, pears, plums, figs and apples, showing a three-years' effort at fruit-growing.

Next came L. B. Barnes' exhibit, from the H. T. Christian ranch, of assorted grapes and fruits, oranges, evaporated peaches and apricots, jellies, and a four-pound cluster of Sultanas overhanging all. From Dr. Johnson's came grapes, fruits and melons; J. P. R. Hall, figs—four varieties; G. M. Hawley, assorted and canned fruits; J. M. Asher, table grapes, jellies, canned and crystallized fruit; Uri Hill, citrus and deciduous fruits, Zante currants, jellies, etc.; Vallejo Ranch (E. S. Vacher), lemons, figs, pomegranates, and many other fruits, green and dried, canned fruits and jellies; Dr. Worcester, a good collection of fruits, green, dried and preserved; Geo. C. Swan (Loma del Cajon), a fine variety of samples of evaporated fruits; El Cajon Vineyard Co., raisins, grapes, fruits, canned fruits and jellies; the Boston Ranch, a full supply of fruits, green, canned and jellied; H. Culbertson, assorted fruits and the finest samples of sun-dried peaches at the fair; G. H. Bowers, Hungarian and Silver prunes, nectarines, Siberian crabapples, and Sultanas, green and dried; Holt Vineyard Co., a fine display of grapes and fruits; Jno. T. Gordon, raisins and fruit, including some especially fine peaches; W. H. Ogden, the usual supply of fruit and samples of licorice-root and sugar beets.

Mrs. B. P. Hill, from the midst of fruit and flowers, dispensed free samples of table wines, as did also E. Brayton of Health Valley. C. C. Furginson of Jamacha sent samples of grapes and peaches, while H. C. Stiles of Spring Valley showed a good collection of limes, lemons and oranges. Herbert Dabney of Jamacha exhibited some magnificent clusters of Chasselas grapes.

The Julian apple country, which sent over two tons of fruit to our county fair at Escondido last season, sent down a large assortment of apples, contributed mostly by Messrs. Bundy, Sawday and Talley. J. W. Somers, La Mess Ranch, contributed guavas, tomatoes, "spuds" and turnips. Several pumpkins of large size were also visible.

The largest cluster of grapes in sight was a bunch of Chasselas marked seven pounds. In the midst of the fruit was the El Cajon horn of plenty, overflowing with its superabundant load.

The fair was well patronized, several carloads of San Diegans coming to enjoy the sights.

HORTICULTURE

Apple Roots Resistant to Woolly Aphis.

B. M. Lelong, Secretary State Board of Horticulture, favors us with a copy of correspondence just received by him from John C. Blackmore of "the Pah Gardens," Onehunga, Auckland, New Zealand, concerning apple roots resistant to woolly aphis, or as they are called in the colonies, "Blight-proof stocks." In opening his letter Mr. Blackmore very properly alludes to Mr. Lelong's last report as "the best gotten-up horticultural report that I know of, reflecting the highest credit on yourself for the most zealous and painstaking manner which you must have bestowed on its preparation." He continues as follows:

In your report I notice on page 214, and in your reports of Horticultural Commissioners, the remarks on woolly aphis. I infer from these remarks that the fruit-growers of California are not acquainted with the method pursued in this country to combat this great enemy to the successful culture of the apple.

In hopes that it may be of use, I send you a short history of the troubles we had to contend with in cultivating the apple in this country, until the fortunate discovery that Winter Majetin and Northern Spy apples were blight-proof. Prior to 1870 the apple tree had for many years been the victim of the woolly aphis in its most virulent form. Apple trees presented a most heartrending spectacle, the trees being gnarled and knobbed from rootlet to branchlet from the abundance of the aphides; indeed, many varieties even with the most rigid attention could not be kept alive. The result was that the apple well-nigh went out of cultivation, and we depended upon our supply of fruit from Tasmania. Things were in this state when Mr. Thomas Lang of Victoria informed us that the Winter Majetin apple really did set the aphides (*S. lanigera*) at defiance, and that in conjunction with a Mr. Treen he was carrying out a series of experiments to test the aphis-resisting qualities of Winter Majetin and other kinds. Further tests proved that the Northern Spy possessed the same valuable resisting qualities as Majetin. The apple tree then became a matter of special study by a few cultivators, both in this part of New Zealand and in Victoria. Seeing the perfect immunity from blight which these two varieties enjoyed, both branches and roots, it at once suggested itself that if these two varieties were used as a stock to work all other kinds on, it would defy the attacks of the aphis below ground.

About 16 years have elapsed since I first drew public attention, through the Australian press, to the above apples as blight-resistant and as stock to work other kinds on, and they have stood every test, remaining entirely blight-proof. When those kinds most subject to blight were grafted on them, all below the graft have proved to be clean. It was in the roots below ground, where the aphis multiplies during autumn and harbors during winter, that formerly gave us the trouble, but by grafting on Majetin and Spy all affected apples, it dislodges this pest from the roots, and the cleansing of the branches of varieties very much subject to blight, and worked on them, is comparatively an easy matter where there is no harbor for the insects below the ground; in fact, varieties formerly very much subject to blight on the branches before working on blight-proof stocks are since almost free, therefore the great obstacle to successful apple culture is removed. This was very forcibly brought to my mind a short time since when acting as judge of fruit at the Auckland Horticultural Show. Ten years previous, when acting in the same capacity, there were only about 20 dishes of apples, but on the occasion I now refer to there were four long rows of tables running the whole length of the drill-shed devoted to apples; the first table contained 1000 dishes of apples for competition, not an inferior specimen among the lot. The other tables were likewise crowded from end to end, among them collections containing over 300 distinct varieties, and all perfect specimens fit to compete with the best grown in any part of the world. Truly we can say of the apple aphis, it is no longer a pest.

In grafting on these stocks, to insure the scion not taking root, the scion or bud should be inserted one foot from the ground; all varieties form a perfect union on either stocks. Northern Spy forms a mass of small fibrous roots close to the main stem. Winter Majetin roots are not so numerous and travel a long distance in search of nutriment.

For some time after the discovery of Majetin and Spy being blight-proof, the stock of each kind was very scarce—the ordinary propagation was too slow a process. The method I finally adopted was to side-graft inverted a piece of any kind of apple root, in an oblique cut, on a Majetin or Spy cutting two inches from its base. The cuttings emitted roots of their own below the inserted root; the following autumn the plants are lifted and the piece of root that was grafted on is cut clean out, leaving, of course, the young plants now on their own roots. The method now pursued, and which was first practiced by myself on a large scale, is to propagate both Spy and Majetin by their own roots, as root cuttings, in planting the roots leaving the smallest trace only above the surface. These root cuttings make fine trees and are fit to regraft the following spring. We also graft Majetin scions on its own roots, likewise Northern Spy, and sometimes work Majetin scions on Spy roots, or Spy scions on Majetin roots. It seems to make but little difference either way; they are blight-proof stocks and all varieties worked on them do well.

Our climate produces a good stock propagated as above, fit for regrafting the following spring.

You can further experiment with New England Pigeon, Striped Beaufin, Gravenstein, Duchesse d'Oldenburgh and Irish Peach. They are seldom affected with aphis; Irish Peach, never.

Any information you further desire I shall be happy to forward, and that you may experiment with these blight-proof apples, true to name, I will forward you 12 small trees of each on their own roots, free of all charge, by the next steamer.

A Shipment of Resistant Stocks.

In a subsequent letter, Mr. Blackmore writes:

By steamship Alameda I send to you, in charge of Messrs. J. H. & Alfred Gunner Bros., a small package containing Winter Majetin and Northern Spy apples on their own roots; also scions of a few varieties seldom affected with blight—woolly aphis for experimental purposes, as advised in former letter. I intended sending much stronger plants, but through sickness I was unable to pack them myself, but had to request a respected friend of mine, W. J. Palmer, nurseryman, to do so for me. As two friends of his, Messrs. Gunner Bros., were proceeding direct to San Francisco, they offered to take charge and deliver at your office a small package; so as not to inconvenience them with a bulky package, small plants have been sent. To insure their being free from disease or insect pests, I instructed Mr. Palmer to wash both cuttings and plants before packing. I shall be pleased to send again if these fail in transit, or trees, seeds or cuttings of anything from here of use to you.

Perfection and Lord Wolseley are valuable late kinds, the former an Australian seedling, the latter of New Zealand. The varieties of apples in the hands of growers about Auckland are very numerous, one grower alone having introduced 800 varieties. The varieties of pears and plums, excepting prunes, are numerous; of peaches, a few years since there were no better varieties obtainable anywhere. Enormous crops were produced until a disease made its appearance, the nature of which is not yet known, and the large groves belonging to the natives and those planted later on by the settlers have died out, and a plentiful crop of peaches is a thing of the past, although there are several good kinds which have not been lost. I do not recommend their introduction into California for fear of introducing the disease with them.

[The small parcel of cuttings duly arrived, and Mr. Lelong donated them to the Agricultural Department of the State University for growth and subsequent distribution. The material is not in very promising condition, but a careful effort will be made to grow it.

Of course the inference that California fruit-growers do not know of the existence of varieties resisting the woolly aphis is not correct. At least ten years ago the late John Lewelling announced at a meeting of the State Horticultural Society that he had found that seedlings grown from the pips of Rawles Janet and the Golden Russet were little injured by woolly aphis. (See "California Fruits," page 97.) The resistance of the Northern Spy has also been known, but that variety is unsatisfactory in most parts of California, and has been but little planted; consequently few have had opportunity to observe its resistance. Mr. John Rock has experimented for several years with resistant stocks, and so have others, and the fact that this is a promising direction for experiment was urged years ago by Mr. Dwinelle and Mr. Klee in the University publications. But for all this we have never done much in commercial propagation in this line, and the facts stated by Mr. Blackmore should attract much attention.—EDS. PRESS]

Rooting Olive Cuttings.

EDITORS PRESS:—I saw an article in your issue of Aug. 9th from your fair correspondent at Pantz, telling her experience in rooting olive cuttings in the open air, also asking for information from any one more successful than herself.

Allow me through the PRESS to relate my experience, although a "tenderfoot," having been here but little more than two years. Last fall, though ignorant about the olive, in order to try my luck I filled boxes about four inches deep with sand, and in December put in them the cuttings, cut only long enough to have two pairs of eyes or leaves, from which I cut the bottom leaves.

I continued to put out more cuttings every month until the last of April. The first boxes of cuttings were put in a box under a single sash, but for want of room the later ones were put in a small, cheap propagating-house 6x12 feet, with four sash on the south side of the roof, each 3x6 feet.

The cuttings were well watered every day, and the sash opened warm days to ventilate, and in March they were whitewashed to prevent scorching. The most essential thing necessary is *patience*, and the next is *constant care and water*.

My cuttings are now rooted and in the nursery row, the trees being from three to ten inches high. By careful observation I found that of those put out in December and January, 90 per cent rooted; in February, 85 per cent; in March, 75 per cent; but in April, less than 60 per cent survived.

I also planted large cuttings ½ to ¾ inch in diameter and 16 inches in length, and only about 35 per cent have started as yet.

Some of the "knowing ones" claim August to be the best month to take cuttings off the trees, so I have started more, which I shall be able to report on later.

Palermo Butte Co., Cal.

FORESTRY.

Wonderful Trees.

EDITORS PRESS:—The subject of *wonderful trees* is an almost inexhaustible one, abounding in interest and curiosity. In our own State are found the most famous groves of gigantic trees in the world, perhaps. One who visited the Mariposa Grove last year writes: "They are not trees at first sight. You can neither measure them with your eye nor sit in their shade—only take in a portion of the brown trunk as large as a good-sized house. It is only by an unusual effort of looking up that we see either foliage or limbs. They are not beautiful—simply enormous."

Imagine one tree measuring 90 feet in circumference; this is true of "Grizzly Giant." "Wawona," sometimes called "Tunnel Tree," has a roadway cut through the solid heart which is 27 feet through, 10 feet high and 10 wide, and yet the tree is vigorous and growing. There are many others equally as wonderful in this famous California forest.

The cypress, in ancient times, was considered a sacred tree, and idols were carved from it. The Pacific Coast Indians were found using it in their ceremony of purification in their wildest savage state.

The mulberry has been called the wisest of trees from the fact that it never puts forth its buds and leaves till the season is so far advanced that there is no inclement weather to be apprehended.

Rosewood is said to owe its suggestive name to the fact that when the tree is first cut the fresh wood possesses a very powerful rose-like fragrance. There are several varieties of this wood and all very valuable.

The Quinnepiac oak at Woodbridge, Conn., which was cut in 1882, was pronounced the oldest tree on the Atlantic Coast. Gen. Lafayette and other officers of Washington's army once rested under its spreading shade while on the march, and a visit to the tree by Woodworth is said to have inspired the poem, "The Old Oaken Bucket."

In front of Macedonia Church, in Columbia county, Georgia, is a quivering tree. Every limb, large and small, on the tree trembles as in fear, or as a suffering animal would quiver, and this occurs when not a breath of air is stirring.

The Scotch fir is a blessing to the country in which it grows. The poor man's hut is lighted by torches made of the branches, which burn most brilliantly owing to the resinous nature of the wood. In the barren parts of Sweden and Lapland the peasants select the oldest and least resinous of the branches, take out the inner bark, which they grind and mix with their

scanty supply of meal, making it into cakes called bark-bread.

In the islands of the West Indies grows a tree resembling an apple tree in hight and size, known as the calabash tree. It has wedge-shaped leaves, large, whitish, fleshy blossoms that grow on the trunk and big branches. The fruit is much like a common gourd, only a good deal stronger, and often measures 12 inches in diameter. The hard shell of this is cut into various shapes by the natives and is sometimes handsomely carved. It is made into drinking-cups, dishes, pails, and even pots, and can actually be used over the fire for boiling water. But the calabash pot gives out after a few trials over the fire, and is unfit for further service.

Probably the only trees which grow ready-made whistles are those found in the forests of Nubia. When this tree is swayed by the wind, strange sounds may be heard like the notes of a flute, a fife, or a penny whistle. The vocal tree was a wonder to all who heard the mysterious sounds, until explanation was given by a scientific traveler who investigated the matter. He found that at certain seasons of the year hordes of insects deposited their eggs on the young shoots and ends of branches. When the young insects emerged, small holes were left in the galls. The wind blowing through these openings caused the strange noise.

In New Zealand is a tree fatal to birds. The seed vessels give off a sticky fluid, and many a fly finds himself on the gummy stuff. These flies attract small birds, and they too get so covered with the fluid that they are unable to fly. They are also attracted by the clusters of ripe fruit, which they intend to eat, but when once covered by this fatal gum they remain, not to eat, but to be eaten by other animals.

The most important article for illuminating purposes in Japan is the candle made from the fruit of a tree which very much resembles the common sumac of this country, and is called "the vegetable wax tree." The berries are the size of a small pea, of a whitish color, hanging in clusters, and contain the wax as a thick, white coating of the seed. The wax is obtained by the berries being crushed, strained and pressed in hemp-bags, or by boiling the bruised seeds and skimming the wax from the top. From experiments made, this tree can be readily grown in this country. It is highly ornamental as well as valuable for its production.

In a part of Africa not frequently visited by travelers, the discovery has been made of a tree which yields butter. Under no system of treatment can it be made to equal that churned from milk, but by salting it is somewhat similar. By heating with a solution of potash or soda it is easily converted into soap.

The "stinging tree" of Queensland is a luxurious shrub, pleasing to the eye, but dangerous to the touch. It grows from two or three inches to 10 or 15 feet in hight, and sends forth a very disagreeable odor. Its effects are curious; it leaves no mark, but the pain is maddening, and for months afterward the part when touched is tender in rainy weather or when wet in washing.

A marvelous palm grows in the village of Pedur, in India. Some children plucked its fruit at five o'clock one afternoon and flocked early the next morning to gather more, but they found the branches now far above their heads. Observation showed that the tree had been changing its position every morning and evening. It is 11 feet in hight. One who has seen it writes: "At 5:30 the tree was almost lying toward the west. The foot of the tree was at an angle of five to seven degrees with the ground, and we were given to understand that it had already commenced to rise from four o'clock. A handkerchief which had been tied to one of the leaves, so that its other end just touched the ground, had risen six inches. At 8 P. M., the 'kerchief was eighteen inches from the ground, and at 3 A. M., nine feet."

One of the greatest wonders of Madagascar is the "Traveler's Tree." Its stem resembles that of a plantain; but it sends out its two wing-like leaves (which resemble a large expanded fan) on opposite sides of the stalk. In an aged tree the lowest of these leaves will be from 20 to 40 feet from the ground. The fruit grows in large bunches, with three or four such bunches to a tree. The leaves are used for roof thatching and the leaf stalks twirled together serve for the walls of the islanders' huts. The most remarkable property of this, and the one which gives its name "traveler's tree," is its leaf stalks, which, even in the driest seasons, always contain water; and the wayfarer, if he be thirsty, has only to pierce the thick base of a stalk to obtain fully a quart of pure and refreshing liquid.

Newton, N. C., has a curiosity that beats by a large majority the rain tree which gained such notoriety in Charlotte in 1886. It is a smoking tree, and baffles all efforts at explanation. It is a white mulberry tree, was brought from Illinois a year or two ago, and is now about 12 feet high, with a bushy top and many lateral branches. Puffs of smoke, identical in appearance to cigarette smoke, are seen starting every now and then from all over the tree; sometimes from the leaves, sometimes from the bloom, sometimes from the bark of the limbs or trunk. The puffs are at irregular intervals; sometimes two or three at once from various parts of the tree, and sometimes they are several seconds or a half minute apart. They just come haphazard from any part of the tree, and as they ascend in the air, look exactly like the smoke from a cigarette.

Professor Schelwisch, the well-known naturalist of Bavaria, while traveling with the Stanley expedition in the heart of Africa, noticed a plant with a peculiar steel-colored foliage. It was growing like other plants from the soil, but on examination was found to be practically composed of iron. The leaves, although very thin, were bent with great difficulty, and in order to secure one, it was found necessary to separate it from the branch with a file. On further examination and experiment, it was found that the plant, or tree, eagerly devoured any metal its roots might come in contact with, and changed its color to the color of the metal last absorbed.

Major Quincy A. Steele, who has been with an engineering corps surveying railroads in Central America for the last two years, gives an account of some very curious trees he met with there. Among the funniest are the electric light tree, a tree which gives milk, and the dough-producing tree. The electric-light tree gives a light so strong that you can read or write by it by night; this tree is not a large one but very conspicuous, and scores of them may be seen over the country, like beacon lights set in the hills.

The milk tree has a big tough skin that can be used for half-soling shoes. To milk the tree, a hole is bored in the trunk; then it lets down sap as white and as sweet as any ever milked from a cow.

The bread from the *bread tree* is not exactly bread when picked, but is a nice stiff dough inclosed in a nutshell about the size of a goose egg. The nut is cracked, the dough taken out and kneaded a little, then is ready for baking. By thinning it down with a little milk from the milk tree, it makes excellent pancakes.

In behalf of those who are interested in trees, I have collected the foregoing from what appears to be reliable literature, and without doubt truthfully describes these forest wonders.

National City. F. L. E.

Forestry and Railroad Ties.

Bulletin No. 4, just issued by the Department of Agriculture, Forestry Division, is a sequel to some previous publications of the division which discuss the relations of railroads to the wood supplies of the country, with reference to the conservation of our forest areas. It contains a brief discussion by the chief of the division, setting forth, upon the basis of a recent canvass among the railroad companies, the enormous consumption of wood material for railroad construction, and especially showing how future supplies are being endangered by the use of the most valuable timber and of the young growth. To satisfy this demand requires the annual culling of the best timber from probably more than 1,000,000 acres of our natural forest lands. The chief value of this part of the bulletin consists in the directions which are given for increasing the durability of wooden ties. These are found to last on an average less than seven years, so that for replacement alone an annual cut of 80,000,000 ties is required. By lengthening the life of the tie a single year, it is evident that a considerable saving would be effected, tending to reduce transportation charges and also to husband our forest supplies. For lengthening the durability of ties, various means are suggested, among which are the selection of lasting timber, proper care in the seasoning of material, attention to the drainage and ballast of the roadbed, precautions against fungi, improved methods in fastening rails, and various preserving processes, some of which are new. The information here furnished is likely to be of value to any consumer of wood material.

The bulk of the bulletin is taken up by a report of R. E. Tratman, C. E., collating the experience of the world in regard to the substitution of metal for railroad ties. It had been stated hitherto that metal ties were used experimentally, but that the time for their introduction was still far distant. This report shows that not only are there something like 30,000 miles of railroad track of the world laid on metal ties, but that where these ties have been used most extensively (namely, in Germany, India and the Argentine Republic), they have shown themselves superior to wooden ties in producing a safer, more permanent, and in the end more economical track. The report is exhaustive, full of the detail which alone can make it valuable to the engineer, and promises to be an important aid in the solution of the metal-tie question, which in this country has received little consideration, from the belief that it is either impracticable, or, with our seemingly inexhaustible timber supplies, premature. The use of the metal tie is expected to economize wood supplies, and by its cheaper maintenance and other favorable features, to reduce transportation charges and increase rapidity and safety of travel.

THE FIELD.

Effects of the Advance in the Price of Silver.

The advance in the price of silver from 94 cents to $1.20 per ounce has a wider bearing than seems to be generally appreciated. There is a general disposition to see in this new departure merely a variation in the amount of currency or a speculative phenomenon incident to a great and sudden advance in the value of an important commodity.

We have heretofore, in round numbers, exported about 20,000,000 ounces of silver per annum, the remainder of our product being absorbed by Government purchases and by use in the arts. For these 20,000,000 ounces there is now opened a market at home, and it would seem at first sight as if for their former export to pay our debts abroad we should have to substitute a corresponding export of gold; but this is not the case. In our three staple exports, petroleum, cotton and wheat, we come into competition with silver-using countries exclusively, with the exception of Australia. Egypt and India supply cotton and wheat to Europe, and with declining values of silver in terms of gold, so long as we were on a gold basis those countries were competing with us at a tremendous advantage. This is proved by the enormous increase in the exports of wheat and cotton from India during the last few years. By causing the appreciation of silver, as measured in gold, we make Indian wheat and cotton cost just so much more as the rise in the gold price of silver measures.

Of course we cannot expect to get the full measure of this advance. The augmented price of wheat and cotton in India and Egypt must, to a certain extent, react in order to meet the increased competition from America. But European markets will rise in sympathy with the higher cost of these exports from those countries measured in terms of gold. Of our cotton crop we export in round numbers 5,000,000 bales, and of our wheat crop from 100,000,000 to 150,000,000 bushels. It is fair to assume that the advance under normal conditions in the price of the exportable surplus of these two staples would reach two-thirds of the advance in silver, allowing one-third to be taken off the increased standard for Indian and Egyptian wheat and cotton, to enable those countries to export at all.

As against the export of 20,000,000 ounces of silver bullion, we have therefore the enhanced value of the exportable surplus of wheat and cotton, to say nothing of oil.

Assuming that we receive two cents per pound more for our cotton out of the now inevitable 30 per-cent rise in the value of silver, we should thus have $10 per bale added to the value of the exportable surplus of cotton, and thus the country would receive from Europe $50,000,000 more than it has received for this staple previously. The same calculation applies relatively to our surplus of wheat and oil.

We believe it will be found that this new value of silver provides the true protection to our agriculturists; and the inferences to be drawn from these facts are plain. Given $100,000,000 more in the pockets of our farmers, and it is safe to argue that an activity such as we have not witnessed in years in this country must follow in all lines and ramifications of business.—*N. Y. Sun, Aug. 21st.*

American Hops in England.

The *Kentish Observer* says that the report of the select committee of the House of Commons appointed to inquire into the causes which have produced the decrease in the acreage of land under hop cultivation has been issued. The statistics which have been laid before the committee show that there have been great variations from time to time in the acreage of land under cultivation of hops, and that this was the case even before the excise duty on English hops and the duty on foreign hops were repealed in the year 1861. The reduction in the acreage under hop cultivation has taken place mainly in the Wealds of Sussex and Kent and in Mid Kent. From the evidence received, it appears that the best qualities of hops are grown in East Kent and in parts of Mid Kent; then come the Farnham, the Herefordshire and Worcestershire hops, the last two of which have grown greatly in favor the last few years, and lastly come those of the Wealds of Sussex and Kent, where hops abundant in quantity but of less value in quality are grown. The decrease of cultivation therefore has occurred mainly in those districts where hops of inferior quality are produced, and it is from these districts mainly that complaints have been made to the committee. The immediate cause of the decrease in the cultivation has undoubtedly been the losses incurred by growers owing to the very low prices which have ruled for hops during the last few years. The great majority of witnesses engaged in the cultivation of hops attribute the fall of price mainly, if not wholly, to foreign imports. They allege that the price of foreign hops rules the market for English hops, and that foreign hops have largely supplanted English hops in the home consumption. The greater number of these witnesses favor the imposition of a duty on foreign hops to the amount of 30s. or more per cwt. By some it is suggested that this duty should be accompanied by a tax of £1 per acre under cultivation of hops in England. This, however, was objected to by the great majority of witnesses. The proposal, therefore, is practically one for a protective duty on hops. The committee, while not excluding evidence in this direction, have not thought it necessary to take evidence as to the ultimate effect and incidence of such a protective duty upon the cultivators of hops and consumers of beer, or as to the expediency of taking a step with respect to a single article of production and consumption at variance with the general commercial and financial policy of the country. The committee cannot recommend the imposition of a duty upon foreign hops. They have not, however, refrained from considering how far the reduction of late years in the acreage of hops has been due to their free importation.

The Chance at the East for California Potatoes.

The *Great Southwest* of San Diego has received a letter from Prof. W. A. Henry of the Agricultural Experiment Station, Madison, Wisconsin, concerning the failure of the potato crop at the East, from which we quote as follows:

I inclose herewith a very complete report on the condition of the potato crop of the country, taken from the Chicago *Tribune* of to-day. From the accompanying map you will observe that in the 14 great States of the Upper Mississippi Valley and Michigan only five report anything of a yield, these being the Northern States of the group from the Dakotas to Michigan, while from Kansas to Ohio and Tennessee the crop is from worse to a failure.

By this report potatoes are now selling as high as 90 cents a bushel in Minnesota, $2 in Iowa, $1.50 in Illinois, $2 in Nebraska, etc.

In parts of this State we will have fair yields, in others very poor. A letter from the central part of the State, received to-day, says that Washington, D. C., parties are endeavoring to get potatoes from that point.

Is not this serious state of affairs with us of import to your people? Cannot Southern California help out in the shortage with advantage to herself? I may be in error, but it now seems as if every potato you can raise might find a market here at a profit to the fortunate producer. This risk is certainly worth trying. Never before within my memory has there been such a shortage of the potato crop from Colorado to Massachusetts.

Another thought. The almost prohibitory prices at which potatoes will sell will make an unprecedented demand for cabbage, turnips, onions and other vegetables. Prices for these would be good, even if there was the usual amount grown, but the same drought which cut the potato crop short has, no doubt, reduced the amount of these products also.

Cannot your people grow cabbage and possibly other vegetables to help out, also? This is an opportunity the equal of which will not soon occur again in all probability.

Commenting upon the above, the editor of the *Great Southwest* says:

This is our opportunity. If early potatoes are planted at once they will mature and be ready by the holidays. Then the ground can rest a month or two and still another crop be raised and marketed before the East will be able to grow another potato. Many persons of Southern and Central California are raising potatoes during this season of the year.

If the potatoes are raised, there can be no doubt about the price. Growers will get anywhere from one to two cents a pound, and perhaps more for them in San Diego. At these prices the business is as certain to pay as any business can be.

This paper suggests that it will be safest to plant early varieties. It takes the Burbank and Peachblow from two to four months to mature, hence if planted now they will not ripen until the winter, just the worst time. Other varieties, such as Early Rose, Goodrich, Garnet Chili, Utah Peerless and Early Burpee, mature in 90 days, and hence would be ready for market if planted at once, before the cool and rainy days that are liable to come in January. It will be seen that the time is none too long, but if planted between now and the 20th of September the venture will be a reasonably certain one. However, the quicker they are planted the better, *so plant at once.* Of course those without water cannot do so.

A suggestion about soil, for those who have not had much experience, may be in order. As a rule the stiff, red mesa soil is not considered good. Sandy mesa like that, for instance, of the Highland district near National, is much better. The sandy loam of our valleys is considered best. The soil should be thoroughly wet, flooded if possible, and then the potatoes put in as soon as it can be worked.

Most planters put the seed in whole until the rains come. In the winter and spring they cut the potatoes just as the farmer does back East.

It will probably be a little difficult to get the necessary seed, should our growers go into this extensively. A receipt was given recently. It is this: Cut the potatoes for seed just as growers do East, spread them on the ground in the sun, which will cause them to wither and burn. When they are sufficiently shriveled, bury them in sand about two inches deep. Keep this sand moist until the potatoes sprout, which should be in from ten days to two weeks. Of course when they commence to sprout they will be ready to plant. Some of our growers are trying this receipt and the result will be published as soon as known.

The above is not for good seed potatoes, but for those not yet ripe or old enough to sprout readily.

It is hoped that the ranchers of San Diego county will look into this potato-raising matter at once. It is a golden opportunity. If the county could ship between now and next June, 2000 carloads of potatoes and cabbage, it would do more than a several hundred-thousand-dollar subsidy toward bringing a railroad here.

PATRONS OF HUSBANDRY.

In our Rural Press Official Grange Edition, issued every week, will be found additional matter from this and other jurisdictions, of interest and importance to Patrons. Any subscriber who wishes can change free to that edition.

Preparations at Watsonville.

EDITORS PRESS:—The State Grange Accommodation Committee, under the energetic management of Overseer A. N. Judd, is progressing finely. The people of Watsonville are responding nobly to the requests of the committee and evincing a truly patriotic interest in sustaining the honor of their town and valley. They propose not only to welcome the State Grange, but to welcome it in such a manner as will not soon be forgotten.

Ample accommodations can be secured for all who may come, at a price not to exceed $1.50 per day for board and lodging, while many of our best citizens will receive visitors at their private residences for $1 per day.

Overseer Judd has drawn an accurate map of the town and can locate individuals or parties in groups at the shortest notice either at private or public houses. All Patrons applying for rooms in advance are requested to state specifically what they desire.

S. Smith, proprietor of "Camp Goodall," at the beach, will receive Patrons at the prevailing hotel rates and give them a pleasant four-mile ride free to and from Watsonville.

Everything and everybody here is working in harmony, and if (as is expected) Patrons throughout the State will, by their presence among us, second the efforts of our people, this bids fair to be the best State Grange yet held. Our "Big 40" class has gone to work in good earnest. Although such new Patrons, they have subscribed to our Grange motto, "No drones in this busy hive." As a result of our last open meeting a snug little class of 20 has been formed and will be put through at once. This being the smallest class yet initiated (with no disrespect to its members), it has been christened "the baby class." As our San Joaquin Patrons are busy initiating and have their hands in, "what's the matter" with our Lodi Star, Bro. Huffman, coming down and instructing the candidates in the I. U. W., also in some of his advance thoughts in regard to insurance and the ballot? A. P. R.

P. S.—Those wishing to secure rooms in advance can do so by addressing Box 263, Watsonville, Santa Cruz Co., Cal.

The Williams' Grove Exhibition.

The formal opening of the Grangers' 17th Annual Interstate Picnic Exhibition at Williams' Grove, Penn., took place Tuesday, August 26th, with 5000 persons in attendance. The opening address was delivered by W. S. M., Leonard Rhone, who congratulated the farmers upon the bountiful crops they were blessed with this year. He was followed by J. J. Woodman, Secretary of the National Grange, and State Senator Gerard C. Brown, who is the State Lecturer.

One of the principal features of the exhibition was the display of cereals, etc., by the Northern Pacific railroad. The horticultural display far exceeds that of previous years.

Twenty thousand agriculturists and visitors from the Shenandoah and other valleys leading to the grove made up the crowd on the 27th, which was Democratic day. Hon. Chauncey F. Black, candidate for Lieutenant-Governor, arrived at noon in a special train, and delivered a stirring Democratic address in the auditorium. He was followed by Hon. S. M. Wherry of Southampton; U. S. Senator C. J. Faulkner of West Virginia; Hon. F. E. Baltzhoover of Carlisle, and Hon. Mortimer Whitehead of New Jersey.

Thursday, 28th, was Republican day, and the crowd was estimated at 40,000, many of those present being prominent Republican politicians from all parts of the State. The exercises were opened by Hon. Leonard Rhone, who introduced Hon. J. H. Brigham, Worthy Master of the National Grange. At 2 o'clock in the afternoon Hon. G. W. Delamater, candidate for Governor, appeared before the immense audience and delivered a stirring address on the issues of the day.

The *Grange Bulletin* says the grove is "a beautiful spot naturally, and with all the surroundings of friends and creature comforts, the thousands of visiting Patrons are having a grand time. If this affair continues to grow, it will be a question as to where the room can be obtained to accommodate those attending."

Kick!

"Farmers, you make a kick, both for yourselves and your families. Kick the saloons out of the country; kick the war tariff out of existence; kick the monopolies that are grinding you to pieces so hard that they will die of reform; kick the political rascals—who make $10 for doing nothing against your $1 for doing something—out of office and put somebody not so 'fresh' in their places; kick out of your deliberations all schemes that have not the fundamental basis of righteousness and common sense to stand upon; kick high and kick hard, for it is the kickers generally that win, if they only know when and how and whom to kick."

The Master's Desk.

R. W. DAVIS, W. M. S. G. OF CALIFORNIA.

The Grange throughout every State in the Union is reckoned upon as one of the steady, sturdy, reliable organizations whose membership is loyal to the country, honest in purpose, industrious in habits and thoughtful in every word spoken and in every resolution written. It is, therefore, no wonder that some of the farmers of America are awakening to the importance of uniting with this organization. It is not wonderful to note that in many ways and places the "Grangers" are being found competent to fill offices, and discharge the duties thereof with honor to themselves and to the satisfaction of those who elect them. And right here it is well to suggest, the beginning has hardly yet been made. May the good work go on and may the seed sown now, or hereafter, bring forth a thousand-fold! Truly, we want the man to be sought, and not the office. Then will we have better laws, purer administrations, lower taxes and more general prosperity. Here's to the good time soon to be, when high and low, rich and poor, will have equal and exact justice done them by law-makers!

It would make a pretty sight if every representative to the State Grange, at the approaching session, would bring a little bouquet of flowers, a miniature sheaf of grain and a small collection of fruit, each package bearing a label with the name of the Granger from which it came. At the State Grange these donations could be given to Ceres, Pomona and Flora, and they would, no doubt, arrange the collection in symmetrical and attractive shape. Will not each one try the plan? It will cost but little labor, and I know it will be a pleasing and winsome innovation.

Bro. J. H. Brigham, Worthy Master of the National Grange, has been nominated for Congress by the Republicans of the 6th Congressional District of Ohio. Without regard to party politics, the farmers and toilers of that district ought to vote for and elect J. H. Brigham.

If you love the Grange, show it by your works, not by words alone.

A better school was never taught than is to be found in each subordinate Grange. Theory and practice are both brought in constant use together right in the Grange meetings. Don't you know that?

Sow some Grange seed just now!

There was some preliminary work done for the organization of a Grange at Burson, Calaveras county. Won't some of our friends tell us what the signs of success are in that healthful and charming part of California? How about it, Brother Waters?

We pay you for your wages
No silver, neither gold;
But with our golden pages
True wisdom we unfold.

These suggestive words are from one of our beautiful Grange songs. There is much food for thought to be found therein. Don't you know the sign of the first degree ought to remind us of the truth of the words above quoted? Do we live for silver and gold alone? Oh, no! There may be "golden pages" in our own lives, if we will only make them so.

We are making footprints every day. Are they such impressions as we care to leave for others to follow, and do we make as many trips for the Good of the Order as we should make? Are they footprints that will encourage the forlorn and shipwrecked brother to take heart again and come to the Grange? If not, then we'd better be more careful of the footprints we are making. Any effort, however small, to do good will some day receive its reward. Let us, then, *make footprints*, but be sure we make them where they will redound to our own honor and to the upbuilding and elevation of humanity.

Patrons, come to the plain
Where the waving grain
Awaits us with our neighbor,
And the bounteous yield
O' the harvest-field
Will repay us for our labor.

That means for you to go to the fair city of Watsonville, October 7, 1890, and attend the annual session of the California State Grange, Patrons of Husbandry—the grandest Order of farmers there is on earth.

AN INTERSTATE COMMERCE DECISION.—On the 5th inst. the Interstate Commerce Commission rendered a decision that the acquisition and consolidation by rail carrier under one system of management of the different competing lines of road, serving the same territory in the carriage of competitive traffic to the same markets, cannot create a right on the part of the carrier to take advantage of the consolidation of interests to deprive the public of the benefits of fair competition, nor afford a warrant for oppressive discrimination with a view to its own interests, such as equalizing profits from its several divisions by making rates and charges for one division that give profitable markets to a portion of its patrons, and higher rates and charges for another division that were destructive to the pursuits of other patrons who are competitors in the same business. But its duty to the public requires that its service must be alike to all who are situated alike. The commission further holds that a road cannot charge one rate for petroleum in tank cars and another for the same in bond. The weight of the barrels must be taken as a part of the weight of the car, just as the weight of the tank is.

Effects of Admission Day.

Evidently the Grange is patriotic in California affairs and Patrons all over the State have been interested in the Admission-Day celebration by the Native Sons and Daughters. Scarcely any correspondence or reports of Grange meetings have reached us lately. This accounts for the lack of matter in this department of our paper this week. We hope our brothers and sisters will make up for this in future numbers.

We notice that a good many members of the Order were present at the celebration in San Francisco which has occupied our citizens pretty fully for over a week. Among those we happened to meet visiting the city the week are E. W. Davis, W. M., P. M., I. C. Steele, Thos. McConnell of the Executive Committee, Past Master Overhiser and wife, J. D. Huffman of Lodi, Albert Woods of Tulare, A. D. Logan, Bro. Bronse, Jr., and wife, Nettie Bronse, Sister Smith of Merced, Bro. Cressey, W. T, Don Mills of Bennett Valley and J. M. Kerlinger of Banta.

Now that the celebration is over, we hope that all hands will push ahead in the work so as to make a good report at Watsonville on the 7th of October.

Anti-Debris Association.

The regular annual meeting of the Anti-Debris Association of the Sacramento valley took place Aug. 30th, at the Courthouse in Yuba City, the President, Dr. C. E. Stone, being in the chair. B. Hull was elected Secretary pro tem.

The report of the President was read, reciting the history of the operations of the association during the past year, and recommends that as the counties of Yolo, Colusa and Sacramento will soon join Yuba and Sutter in the efforts to put an end to the destructive mining, arrangements should be made to give these counties representation upon the Board of Directors of the association.

The report of the Manager, Geo. Ohleyer, gave a statement of the present status of hydraulic litigation.

On motion of P. L. Bunce, the Secretary was ordered to cast the ballot of the association for the present Directors, which was done, B. F. Walton, T. B. Hull, G. W. Hutchins and P. C. Slattery being elected. G. W. Carpenter was elected Treasurer for the ensuing year.

State Grange Standing Committees.

Credentials—Bros. J. D. Huffman, John Gould, A. P. Martin, Sisters G. Ohleyer, Nellie G. Babcock.

Division of Labor—Bros. W. J. Hill, James Austin, N. Jones, Sisters V. W. Still, Katie Briggs.

Finance—Bros. Daniel Flint, M. D. Atwater, W. P. Crane, Sisters G. Harris, J. Hollister.

Resolutions—Bros. S. T. Coulter, H. M. Larue, M. W. Wingate, Sisters W. L. Overhiser, D. Flint.

Constitution and By-laws—Bros. I. C. Steele, A. M. D. McIntosh, Rufus Fisk, Sisters S. T. Coulter, W. Johnston.

Good of Order—Bros. W. L. Overhiser, C. E. Howard, B. F. Walton, Sisters W. W. Greer, J. V. Webster.

Co-operation—Bros. Wm. Johnston, J. D. Lindner, J. W. De Golia, Sisters Hattie S. Jones, T. McConnell.

Legislation—Bros. Geo. Ohleyer, J. M. Moore, J. H. McKune, D. Flint, S. T. Coulter.

Literary Committee—Sisters A. P. Roache, M. B. Lander, N. E. Alling, S. H. Dewey, Eda Walton, Bros. Fay Raymond, Don Mills, Robt. G. Williams, G. C. Wardell, James Connell.

WALNUT CREEK GRANGE.—This Grange has invited Danville, Pacheco and Alhambra Granges and other Patrons to join in a Harvest Feast, on Saturday of this week. Rev. S. Goodenough, W. C. of the State Grange, Visiting Deputy, will be present and address the meeting. It is hoped there will be a large number present.

A COMPLIMENTARY EXCURSION.—Watsonville Grange has arranged for a complimentary excursion to the grand Moro Cojo beet ranch near Salinas, among other delightful entertainments for the State Grange. In a week or two a more complete and definite program may be expected to be announced in our columns.

BRO. CRESSEY IN TULARE COUNTY.—Bro. Cressey, between the 20th and 27th of September, expects to visit Selma Grange in Fresno, and Lucerne, Hanford and Tulare Granges. We hope to be able to announce the dates and particulars next week. We trust a rousing good meeting will be held at each place.

Later—Meet at Tulare, 10 A. M., Sept. 20.

PLUMAS GRANGE.—Brother Past Master Flint will visit and address this Grange and other farmers Oct. 1st, 2d and 3d. No doubt a grand gathering will be had of the sturdy farmers of Beckwith valley.

State Grange Excursion Rates.

TO PATRONS OF HUSBANDRY:—The Southern Pacific Company has agreed to give reduced rates to all who attend the State Grange at Watsonville (commencing Tuesday, October 7th) from all parts of California, over all their lines, according to the following terms and regulations:

Patrons will purchase first class [unlimited] tickets to Watsonville from their local stations, on the railroad lines, being particular to *take a receipt from the station agent*, on the certificate [blank receipt] which will be sent them for that purpose.

Upon application to the Secretary at the State Grange, this certificate will be signed, certifying to the fact that the member of the Order has attended the State Grange and is entitled to purchase a return ticket from the Watsonville station agent at one-third unlimited first-class fare. The surrender to the agent of this certificate and receipt will enable the holder to secure a homebound ticket at one-third price, making the cost of the round trip two-thirds the regular rate.

Blank receipts will be forwarded early in advance to each Grange, to be furnished to members. In case of necessity, blanks can be applied for by Patrons direct from this office. When several tickets are bought together, the names can be included in a single receipt

A. T. DEWEY, Sec'y S. G. of Cal.
San Francisco, June 28, '90.

Limits of Stop-Over Privileges.

Patrons taking advantage of reduced rates to the State Grange and buying S. P. C tickets to Watsonville should take receipt therefor on the certificate furnished by the secretary. They are at liberty to buy tickets as soon after receipt of certificates as they desire, and can stop over on such ticket at any points on the route covered thereby. The tickets *bought at Watsonville*, however, will *not* give this stop-over privilege, as the home-station, if on the coast division, *i. e.*, between San Francisco and Templeton, must be reached within one day of adjournment of State Grange and other points within two days of said adjournment.

The Donahue railroad offers the same reduction as the Southern Pacific. Separate blanks will of course be obtained for passengers over that road.

At the Oregon Agricultural College.

Our engravings will give the reader a glimpse of the facilities provided and a suggestion of the work done at the Oregon Agricultural College, situated at Corvallis, Benton county. The exterior views show the Students Hall, a large building recently erected; the Mechanical building, in which is situated the workshop, of which an interior is shown; and the greenhouses in the horticultural department. The interiors of the zoological laboratory and the chemical laboratory have a character suggestive of good work in these departments. Not the least interesting is the view of the cooking class actually engaged in their practical duties. We trust these views will assure our readers that there are opportunities for instruction at Corvallis worth availing themselves of, and that by making application to the college authorities they will receive a descriptive catalogue giving full information concerning the institution.

ORLAND GRANGE.—We are informed by Bro. A. D. Logan, who was present, that Orland Grange held a meeting last Saturday and made an appointment for another meeting, at which an alternate representative to the State Grange will be elected and other important business transacted.

FARMERS' INSTITUTES.

Hop-Growing in Oregon.

At the recent Farmers' Institute held at Grant's Pass, Oregon, John S D nise gave the following very interesting and detailed account of the practice of hop-growing in Oregon:

Among the many products that may be prominently mentioned as growing to perfection in the soil and climate of Southern Oregon is hops.

As early in the spring as the condition of the soil is favorable for working, plowing begins, commencing in the middle of the row, with a two horse plow, turning the furrows to the center or from the hills. The yard being gone over, it is then cross-plowed in the same manner, the object being to get as much dirt as possible from the hills to facilitate the grubbing, to kill whatever weeds and grass may have started and put the ground in good condition for after-cultivation, as quite a while will elapse before the grubbing and pruning will have been done, the poles set and the earliest started vines trained to admit of horse and plow.

Then begins a very irksome and laborious part of the culture, the grubbing and pruning. The dirt being thrown out of and away from the hills by the use of the common flat-tined fork, exposing all the runners, leaves the hill in good shape for pruning, besides serving the very excellent purpose of being equivalent to a good hoeing. There is no particular skill required on the part of the pruner, but considerable activity, and one who is entirely free from all rheumatic and malarial troubles, as it would take a good tallyman to correctly number the times he should get up and down in a day. He carries with him a short, stiff knife, sharpened on both sides, with which to cut off the runners and do what other pruning is required. Strung to his waist is a butcher's steel to whet the knife while going from hill to hill. A good pruner will keep up with two men using the forks.

Then comes the pole setting; some growers using a shovel for digging the holes, others a dibble, others a post-hole digger, each having its merits according to the character of the soil in which it is worked. From 20 to 24 inches is about the required depth for a pole to be substantially set. This, although apparently an unimportant part of the business, is something that needs to be intrusted to careful hands, as any amount of damage can follow by the poles toppling under their heavy accumulating loads and hard winds, the tops whipping each other and breaking off the arms, and poles falling to the ground, often snapping the vines from the roots. The usual practice here is to set one pole to a hill. As to the length of a pole, I believe it to be the prevailing opinion among growers here that hops ranging in yield from 800 to 1200 pounds per acre, from 15 to 18 feet; from 1200 to 2000 pounds, 18 to 22 feet, and for anything over 2000 pounds, up to 30 feet insure the best results, as such lengths allow all the hops to be exposed to the sun and air, which are indispensable to the perfect development of the essential properties, and give better satisfaction to the pickers, all light and feathery hops being avoided. The yard should be poled by the 1st of April and not possibly later than the 10th, as by that time many of the vines are up and growing vigorously.

Training should begin as soon as the vines are long enough to give at least one turn around the pole. Squares are cut from baling cloth and let lap over a string tied around the waist, the strands being pulled out in passing from hill to hill. The vine invariably climbs from right to left or round with the sun; consequently in training, care is taken to always start it in the right direction and not over 20 inches from the ground, and left slack enough to avoid any jerking at the root from the swaying of the pole. The string being passed around the pole is twisted between the thumb and finger and given a sort of tuck, but not drawn tight enough to cut the vine. From four to six vines are allowed each pole, the stoutest being chosen. Simultaneous with the training is the incessant labor of getting away with the excess of vines, either by pulling them off or cutting them, any way to get clear of them. By the time the yard has been gone over, enough hills will have started to repeat the same treatment, three or four times going over the yard being necessary to get the vines well started up the poles, owing to the unevenness of their coming out of the ground and the lopping off of many which have already been tied up, which is especially the case in cool, cloudy weather.

The general cultivation by this time should be well advanced. The soil should be brought to a fine tilth by thorough and frequent working. The depth of culture is also no insignificant matter, as in our dry climate we must keep the moisture continually rising from the bottom. Very satisfactory results follow from the use of the shovel plow, following after and in the bottom of the furrow of the side plow. About the first week in July the cultivation should cease, as about this time the burr will be found forming and the ground filling with innumerable fibers, called feeders. It will have been found necessary to have gone over the yard with a hoe to clean the hills of weeds and mellow the dirt that will have been crusted by the rains.

For awhile we have rest from the hop-yard; nothing to do in it till picking-time, save the propping up of fallen poles. But in the interim the sacks and boxes must be repaired, furnace pipes taken down, cleaned and replaced; furnace wood cut and hauled to the dry-house; hop cloth, twine, brimstone and baling cloth secured and hop-pickers and pole-pullers engaged. About the 4th of September opens up the picking season, which lasts about three weeks. Notice is given the pickers and pole-pullers in due time that all may be on the ground with their camps fitted up and ready for action on the opening day. The foreman or checkman will then start them in their respective duties.

The duty of the pole-puller is to cut the vines about three feet from the ground, pull up the poles and place them over the boxes for the pickers, to take the poles when stripped of the hops from the box and empty the boxes when filled in the sacks; each sack holds two boxes.

The duty of the picker is to pick the hops clean and whole, not wad them or allow large leaves or stems or clusters of over three hops to mingle with those in the box, and receive a check when he has his box level with the top. Every intelligent person will recognize the importance of systematic work where a number of men are employed, be it in the field or factory, and in the harvesting and manufacturing of hops it becomes imperatively so to successfully accomplish the gathering of the crop and have it grade on the market strictly choice. Enough pickers should be employed to keep the dry-house constantly running to its best capacity, and its drying capacity should be equal to the amount of hops to be harvested in a time of not longer than three weeks, as they seldom hold good for any greater length of time.

The checking should be accurately done; every check should be able to be accounted for. A very good system is to issue the checkman a certain number in the morning as he starts out. To illustrate: Say 100 at noon; if he returns with 25 it is seen that he has given out 75; then examine his time-book, and if he has 75 tallies it proves itself that each picker has been correctly tallied. Every picker's name is placed on the time-book and given a tally in the column corresponding with the day of the month when he receives a check. If the difference between the checks returned and those issued do not correspond with the number tallied, the mistake is easily corrected with the picker with whom it has been made, as no picker will forget the number of checks received from one half-day to the other. Under such, or a similar system, there is always the satisfaction of knowing the number of boxes picked, and in case of fire, should there be any insurance, the adjusting agent can be given the exact loss in boxes and very nearly in pounds. If a picker claims he has lost a check or more, it is quickly ascertained by comparing his checks on hand with his tallies, and the gratification of having a safe and ready medium by which to calculate the cost per pound for picking. The checkman also keeps the pole-pullers' time. Each night the accounts of the day are transferred to another book, which can be kept clean and for after reference.

When a load of hops is sacked it is taken to the dry-house by one whose duty it is to haul the hops, keep the pole pullers supplied with sacks, and the camps with provisions and other ordered articles. The point to be reached in drying is to evaporate the moisture contained in the hop without injury to the essential ingredients. The virtue of a hop lies in the little bright golden-colored globules covering the base of the leaf called lupuline. As to just what degree of heat will do the injury there seems to be a difference of opinion among the best authorities, but it is found to be always safe to subject a flooring to not over 140 degrees. A flooring of hops being laid, the furnace is fired up and a steady current of hot air is kept passing through them till sufficiently cured. Considerable brimstone is burned under them, saving the treble purpose of bleaching, hastening the drying and aading to their keeping qualities. Eighty boxes can be dried on a floor 22 feet square, in from 16 to 20 hours, which would be about 850 pounds dried. When the flooring has been cured it is taken to the cooling-room or bin to await the baling. After the drying has been completed, about ten days or two weeks is allowed them to go through a sweat, so as to become more uniform in color and quality before baling. The baling being done, which is similar to that of wool or hay, except the bale is covered with 24 oz. burlap, the hops are then ready to go into the hands of the dealer.

The figures for ascertaining what it costs to produce a pound of hops ready for market are taken from a strict account kept of my own yard last year, or 1889, and which I think will answer for a comparative average:

8¼ days plowing before grubbing at $2.25 per day	$19 68
62½ days plowing and grubbing at $1.25 per day	78 12
75¾ days setting poles at $1.25 per day	99 68
20 days hoeing	25 00
42 days training vines at $1.25 per day	52 50
39½ days cultivating at $1.75 per day	69 12
10 days propping up fallen poles at $1.25 per day	12 50
2000 poles, which is about what it will take to keep the yard replenished yearly, at 1¼c	25 00
2000 poles hauling	45 00
21881/2 checks issued at 40c per check	875 40
59½ days pole pulling at $1.41 per day	83 89
13 days yard foreman at $1.75 per day	22 75
13 days hauling to dry-house at $2.25 per day	29 25
13 days two men drying at $1.75 per man	45 50
40 days baling at $1.25 per day	50 00
11 days cartage at $2.25 per day	24 75
850 lbs. brimstone at .043c per lb.	36 55
574 yards of burlap, or 123 bales, at 13 39-100c per yard	76 85
12 lbs. sacking twine at 30c per lb.	3 60
15 cords furnace wood at $1.25 per cord	18 75
15 cords furnace wood cartage, 7 days, at $2.25 per day	15 75
24 days stripping poles at $1.25 per day	30 00
20 days stacking poles and burning vines at $1.25 per day	25 00
Incidentals	20 00
Total	$1779 64

Total, 18 acres, 22,136 pounds.

Using these figures to compute the cost per pound, it is found to be .08039c.

The Decorative Craze.

Put away the little coal-hod that our darling wants to paint,
For she fain would decorate it with devices queer and quaint.
Hide the dustpan and the washtub, and likewize the garden hose,
Or Matilda will adorn them with the lily and the rose.

When Belinda in the morning gets the wooden chopping-bowl
To concoct the morning corned beef hash, it vexes much her soul
To behold a wreath of pansies where she fain would cut and slash;
So she scrapes it off, because the paint might penetrate the hash.

On the household rolling-pin is tied a pretty yellow bow,
And its lilies of the valley oft comming'e with the dough
While the new potato-masher and the kettles and the pots
Are magnificent with butterflies and sweet forget-me-nots.

All our articles of furniture, the ancient and the new,
Are resplendent quite with drapery and bows of brightest hue;
In the house we look about with mingled sorrow and amaze,
For Matilda is affected with the decorative craze.

Selected.

Li-ten!

Whoever you are as you read this,
Whatever your trouble or grief,
I want you to know and to heed this:
The day draweth near with relief.

No sorrow, no woe is unending,
Though heaven seems voiceless and dumb;
So sure as your cry is ascending,
So surely an answer will come.

Whatever temptation is near you,
Whose eyes on this simple verse fall,
Remember good angels will hear you
And help you to stand if you call.

Though stunned with despair, I beseech you,
Whatever your losses, your need,
Believe, when these printed words reach you,
Believe you were born to succeed.

You are stronger, I tell you, this minute,
Than any unfortunate fate!
And the coveted prize—you can win it;
While life lasts 'tis never too late!

—Ella Wheeler Wilcox.

Raising Boys.

Alice Chittenden writes to the *Country Gentleman* of her observations in California and deductions therefrom in the following suggestive way:

I want to say a word for the boys on farms, founded on some of my own experience. Somehow I feel as if some of them do not have quite a fair show. As their sisters grow into young ladyhood, the best bedrooms of the house are furnished for them as daintily as the parents can afford, and decked out with white curtains and blue ribbons. As for the parlor, it is there they receive their friends. "Boys are such a nuisance," and Jack and Tom soon feel that their room is better than their company. They have no pretty den to invite them to loll and read in its easy-chair, and so, having no resources, they stroll down to the village or cross-roads grocery, if they live in the country. As for the city boys, who are often just as much in the way of their sisters, God help them! Their homes need be attractive, indeed, to vie with the evil places, all light and merriment, that are everywhere open and ready to lure them to destruction.

A boy is not supposed to care for curtains and furniture, and so, especially in country places, he is too often stowed away in any sort of a room, perchance one that is half filled with lumber and disused trunks, without a single cosy corner for him to delight in, or one bright, cheerful, attractive object on which his eye can rest the last thing at night and the first thing in the morning. The attractiveness of a boy's room is not, as a general thing, to be measured by the wealth of his parents; it is a question of the loving heart and deft fingers of a mother or sister working for love of the bright-eyed lad who feels that his home is the dearest spot on earth.

Let me illustrate. Side by side, in the lovely foothills of the Contra Costa range, lie two ranches, alike beautiful for situation, on each of which I spent several months a few years ago, with nothing to do but to enjoy the charming California winter, pick up the raveled threads of my health, ride the fleetest of Mexican mustangs and make observations.

The eldest son of my first host—Mr. Rodney—never spent his evenings away from home, much to the chagrin of the "boys," for Rob was universally voted a "good fellow." Fun was seldom inviting enough to tempt him away from his home; so one evening the boys accepted Rob's invitation to "come up to the house." Anticipating their shyness if he took them into the family living-room among his bevy of pretty sisters, Rob ushered them at once upstairs to his own den. It was only a garret room, with large floor space and lath and plastered sloping roof, with dormer windows, but there was a brightness about that room that went at once to the heart of every one of those lads, as I, who had seen the homes of some of them, knew. Rob had tinted the walls a delicate robin's-egg blue, with trimmings of terra-cotta, but it was done with kalsomine, not paint. Now a robin's-egg blue is as much green as blue, and everything in this room was in charming harmony. A loving mother or sister had hung white cheese-cloth curtains at the windows, which, although they cost only a few cents a yard, had a pretty border of coarse drawn work, and were looped back with pale green and terra-cotta ribbons. The bed was as daintily white as those of the spare beds at the homes of the other boys. It was not even covered with a counterpane, but wore a home-made affair of cheese cloth, knotted like a comfortable with worsteds of the same shades as the ribbons at the windows. The prints on the walls had been taken from illustrated papers, copies in wood of good engravings or paintings, and Rob and his sisters had fashioned frames of moss, or bark or lichens from fence rails, or from the golden straw of wheat and rye, interwoven with the dainty, fibrous green moss found on decayed tree trunks and fences.

The sofa was a mere frame of Rob's own manufacture of rough, unpainted boards, with barrel staves nailed across, and on this a plenteous upholstering of soft hay covered with stout, coarse muslin; over this was thrown a rug that showed again sister love, and originality as well, for these young girls knew nothing of the artistic possibilities of denim as set forth in the present day by the various fancy and art magazines; they did not even know it was called "denim." To them it was only blue jean or overalls goods, but they had taken a strip sufficiently long and wide to cover Rob's improvised sofa, and bordered it with a fringe of coarse yarn of a terra-cotta shade, home dyed, working it here and there with clusters of oak leaves outlined in the same shade and drawn from nature, for the nearest village was too primitive to have a store with a stamping outfit. There was a big, soft pillow for it, and a bracket for an oil lamp at the head of it at such an angle that Rob could lie and read in comfort.

There was also a set of book-shelves which Rob had made, containing his few books. His gun hung on a rack of rustic boughs which he had cut in the forest and nailed up. It was of the gnarled, rich red manzanita wood, but if any Eastern boy is enthused by this recital to adorn his room in like manner, he will find in our own beautiful forests many a substitute. The dominos and checkers with the checker-board were likewise of home make, and the boys spent so pleasant an evening that they comprehended at once why the store had no attraction for Rob.

Parents do not always realize what a lodestone such a room is to a boy, nor how powerful an agent in keeping him away from evil associations. Rob was going to be a farmer, but it was from choice. Sensible Mr. Rodney believed that in the matter of a life-work every boy should have his choice, and one younger lad was away at an Eastern trade-school learning brick-laying. I expect to hear of him yet as a prosperous master builder. Of the five girls, from baby Beth the twelve-year-old, rosy-cheeked, efficient little housekeeper, to grave and earnest Ruth, the kindergarten teacher, every one was able to earn her own living if necessary.

My other picture is not so pleasant. My second host had seven sons and one daughter. The latter had graduated at a young ladies' school in San Jose, and had returned home prepared to look down upon her family and surroundings and to be discontented with her lot. The youngest of the boys had almost reached manhood, but not one had been taught any useful trade. The ranch, which was not a large one, promised them no future when it should be parceled out among so many. In short, they had no prospect beyond that of ordinary laboring men. It used to make my heart ache to see the hopeless and yet doggedly filial way in which these boys went about their daily duties, working all day at an employment in which they had no pecuniary interest, and tumbling at night into hard beds in cheerless rooms. One of the lads had worked out for himself a sort of career, and was known as the best whip and horse-breaker in the county. The last I heard of him he was driving the four-horse stage between Truckee and Lake Tahoe. Another brother hired himself out to a neighboring nurseryman with some vague idea of learning something by which he could raise himself above the level of a Chinese coolie.

I asked the mother, a handsome, brown-eyed and white-haired lady of 55, why she had not had her sons taught some trade. She replied that her husband was very "set in his ways," and when he found that the boys displayed no special aptitude for books, had become discouraged with the idea of making anything out of them.

This was the spirit of the old Scotchman, who when asked if he intended to send his boy to college, replied, "God forbid that I should spend $5000 on a ten-cent boy."

Don't think that because your boy is no genius he is not fit for anything. Guided and directed, he will at least make a good and useful member of society. Find out his one talent—he is sure to have at least one—and cultivate that to the best of your ability. The more I study the lives of boys and young men, the more I see the practical value of such institutions as trade schools. A boy who would make a poor accountant or lawyer, may have a genius for engineering. He might make a bad preacher but a good bricklayer. If he elects to be a farmer, let him learn the scientific side of that noble profession.

Mothers and sisters, let your sons and brothers feel that the nicest thing in the world is to have a wide-awake, romping, whistling boy about with all his boyish spirits and nonsense. Teach him to be neat if you can, but don't nag him. Don't make him think it a sin if he shies his hat across the room instead of hanging it on a peg. The boy who grows up with the feeling that the best place in the world is home, and the best part of home is mother, will seldom go wrong. This is your work, mothers, your first and best work. Far better is it to teach our boys to be good men and right voters than to vote ourselves. We can safely leave the ballot in the hands of men who have had the right home and mother training.

Girls and Values.

[Written for the RURAL PRESS by MARGARET B. HARVEY.]

In these days, the majority of parents are anxious that their daughters shall earn money. Shall we say *too* anxious? I am afraid that in many cases this question can only be answered in the affirmative.

It may be all right enough for girls to earn money, and all right enough for parents to desire that they should. But why do parents, as a rule, take so little trouble to tell or teach their daughters or themselves what money is *for?* In other words, to give an intelligent reason *why* young women should earn money?

Why, exclaims the careless reader, anybody ought to know that much. To get clothes, to relieve their parents of the burden of their support, to help their younger brothers and sisters. Softly, my friend. You don't quite understand.

According to all accounts, in old times a girl was told that it was her duty to stay at home and do a servant's work, but without wages. Now she is ridiculed as lazy if she wants to stay home, and told that her board, at least, is worth $5 or $6 a week. She must find some way to pay this, just as much as if she was a stranger in her father's house.

We are informed that years ago a girl was satisfied with the occasional gift of a calico frock and a sunbonnet, while now a girl wants to wear silk and jewelry. But the fact of the matter is her parents would not be satisfied to see her in a calico frock and a sunbonnet. The average girl of to-day is *not* considered the rightful heiress in her parents' home, however humble, nor is she entitled to a present share in whatever goods it may contain; she is a tolerated interloper, who must scramble for her own board and clothing. She must earn money or else feel herself a pauper.

Do you consider this a desirable state of things, or can you not see that a girl may earn money, not so much to get clothes, etc., as to save her own relf-respect?

Can you not also see that this may involve too great a sacrifice? May she not feel forced to work merely for work's own sake? May she not come to believe that the money she earns is worth more than herself—more than her health, her rest, her time or her daylight? Is it not possible that by overrating the necessity of work, and not teaching the relative value of money, parents may rob their daughters?

To illustrate: Against her own prayers and wishes, a young girl was forced by her parents to send to their sectional board an application for a situation as teacher. Her name was forthwith placed on the "substitute list." Soon after, she had an opportunity to teach one day—and a day of terror it was—for which she received one dollar. Now what should she do with that hard-earned dollar? Her mother advised her to buy *two white aprons!*

The girl remembered her aching head, her tired limbs and her tortured nerves, and thought what a mockery was such a price for such a day's toil. She could have done without the aprons fifty times over; gladly would she have rested her weary head upon her pillow for but one-quarter of the day; but then somebody would have said she was lazy. While teaching, she was out of her mother's way, and her mother economized on her board by giving her two meals instead of three.

You can scarcely believe this, you say? Well, I can give you dozens and dozens of variations on the same theme, such as this: A mother takes her daughter's dollar and goes out and buys a trashy lithograph, most offensive to the daughter's artistic sense. The girl says, with a sinking heart, seeing how little are her best gifts appreciated, "If I had known you wanted a picture, I could have hired a substitute with that dollar, and stayed home a day and drawn you something prettier than that." Just think—one day blotted out of a young girl's life for a hideous caricature not worth a place in an attic!

I have known of a girl sitting down all day and crocheting a yard of lace, receiving therefor twenty-five cents—and then spending it all for candy, because her mother remarked that she was "stingy and selfish if she didn't treat;" and I have known of a girl tramping out in all kinds of weather for a whole month, to earn forty dollars, and then paying the entire amount for a gold chain because her mother wanted her to "look decent." The chain is out of fashion now, but that month will neve come back.

Don't misunderstand me. Gold chains are well enough in their place, and candy is nice sometimes; but there is such a thing as paying too dear a price for either. Had one girl not felt obliged to buy candy or crochet lace, she might have taken that day to visit a picture gallery; and had the other girl done without the chain, she might have purchased blessed freedom for a month, and attended a course of historical lectures, or practiced music or painted a landscape. There are better things in the world than money, or jewelry or dress—and our girls ought to have them and feel that they have a right to have them.

"But," you ask, "why do so many girls put all they can get on their backs? Don't they know that is bad taste?"

Yes, they *do* know it, in spite of all popular assertions to the contrary. But they also know that by putting their money on their backs they are most likely to get the good of it. If they save it for a rainy day, for education, for art, for travel, like as not, just as soon as they get a respectable amount, some relative is going to beg, or coax or threaten it away from them, and they'll never see a penny of it again.

Altogether, the world is a hard place for girls. Any girl who has her own living to make has quite enough to do. Don't talk to her about "gentle ministry" and "unselfish devotion," etc.—she has already found out all that you can say, and perhaps wonders why you don't take your turn in exercising a little "devotion" and "ministry" toward *her;* that is, if you are a brother, perhaps a parent, for these are the only ones who can make a girl's lot easier. In spite of all that has been done to open new avenues of employment for women to increase their wages, to shorten their hours or to respect their efforts, the fact remains that a girl's own relatives are most likely to prove her worst enemies.

If parents only realized that dress, simply *as* dress, is not worth working for; that a right-minded girl is not going to sell her liberty for candy and gold chains; that by doing without trifles it might be possible to enjoy rest and leisure, would the same necessity exist for girls working so hard as is supposed to exist now? Could not some feel that they had a right to stay in their father's houses, the charm of their presence constituting a fair equivalent for board and lodging? Could not others take a longer time in preparation for work, and thus in the end be fitted for a higher grade of employment? Could not still others find occupations which only took a portion of their waking hours and gave them sufficient for their every-day necessities? And would not the result be that the ordinary avenues would be less crowded, giving more opportunities to those who actually needed to walk therein?

How many people really know the value of a dollar? Why, a dollar will board a person for a whole day. It will buy you three meals at twenty-five cents each, and give you a bed all night. No one's board need be worth more than this, unless it is extravagant. Any girl can do a dollar's worth of work about a house in a day. The value of her work is at least equal to the value of her board—*good* board at that. Nobody need say a word about "keeping her;" if she has two eyes, two hands and two feet, she can keep herself. The chances are that her services in a house in one day will be worth more than a dollar. When we consider how many working women have to spend all they make for board, and depend upon precarious gifts from their relatives for clothing, the advantage is rather on the side of the girl who can stay at home. The great trouble is, so many girls are made to feel that they are not welcome at home, or are a trouble and an expense.

But then, people have queer ideas of expense! I knew one woman who thought a silk dress a necessity and a pair of rubber overshoes a luxury, and another who thought a Webster's dictionary quite an extravagance and gilt jewelry an economy. The queerest perversion or inversion of ideas that ever came to my notice was in the speeches of a hard-working dressmaker. She made it her business to peer curiously into a package carried by one of her young lady customers, and found therein two little walnut brackets. "How much did you pay for them?" asked the dressmaker.

"Fifty cents."

"Fifty cents! You ought to be shot! You might have got a *nice cake* for that!"

"I can't afford to spend fifty cents for cake," said the customer. "The cake would be gone in an hour, but these will decorate the parlor for years."

"Well, *I* can afford to have cake," declared the dressmaker, "and I won't have common cake, either. I'll have the most expensive black fruit cake." And the customer thought she began to see why the dressmaker was always poor and lived in a shabby house. The worst of it was that she was not cheating herself so much as she was her children. In later

years her son was known to declare that he "never had a home." Is all this foreign to the subject? Hardly. What I am trying to impress is the idea of relative values.

Which is worth more, a girl herself or what that girl can be made to do?

"But is it not right that she should help others?" you ask. "Suppose her parents, her brothers or her sisters need her assistance?"

Suppose they do—it *is* right for her to assist them; perhaps her bounden duty. But then we have heard so much of this side of the story that we forget the other. Any desirable thing can be carried to excess. A girl herself is likely to be quite as good as anybody she helps; but others are not going to think any too much of her if they find that they can impose upon her. She may injure them by relieving them of a due sense of responsibility and thus strengthen the selfishness in them. Remember the homely old proverbs, "It is the pulling horse that is whipped," and "The toad under the harrow stays under the harrow."

How much do you think that girl helped her mother by buying white aprons? I think she only cheapened herself; and something like this is what the greater part of girls' work is made to amount to when estimated outside of the business world. By a mysterious home-alchemy, its price is transmuted backward, from gold into a baser metal.

These things ought not so to be!

Chaff.

WHIPSOCKET asks: "How expensive is it to keep a horse?" That depends. In some parts of Texas it is impossible to keep a horse at all.

W. CHILDERS KIDD (looking for board): Oh, I forgot to mention that two of my party of four are small children. I hope that will not make any difference. Mrs. Hashton (sweetly): Oh, not at all! I shall charge just the same as if they were grown up.

LATEST INTELLIGENCE.—By the way, where is that place Heligoland they're all talking so much about? Oh, don't you know, dear? It's one of the places lately discovered by Mr. Stanley.—*Punch.*

QUEER FREAKS OF COLD TYPE.—In "making up" newspapers, or piecing together different paragraphs into columns, items will sometimes be jumbled together and amusing results appear. A French newspaper has a good specimen of this kind of mixture: "Dr. X. has been appointed head physician at the Hospital de la Charite. Orders have been issued by the authorities for the immediate extension of the Cemetiere de Pardasse." The New Haven *Journal* some time ago made a curious jumble of two items. One read: "A large cast-iron wheel, revolving 900 times a minute, exploded in this city yesterday after a long and painful illness. Deceased was a prominent thirty-second degree Mason." The other paragraph detailed how "John Fadden, the well-known florist and real estate broker of Newport, R. I., died in Wardiner & Russell's sugar-mill at Crystal Lake, Ill., on Saturday, doing $3000 damage to the building and injuring several workmen severely."—*Exch.*

THE HUMAN EYE.—It is a well-known fact in science that the eyes are more the epitome of the man than all the other features that may help to suggest character.

YOUNG FOLKS' COLUMN.

Anecdotes of Canaries.

EDITORS PRESS:—Canary birds are believed by many persons to possess the power of reasoning, as many of their habits cannot be accounted for on the theory of instinct.

One lady, who had raised many birds for market, learned by observation that the grandfather bird, although hanging in a cage in a separate room from the young, and entirely out of sight even when the doors were open, always seemed to know when anything was going wrong with the young birds, and on one occasion he was heard uttering peculiar notes of distress while flying repeatedly from his perch to the bottom of his cage and back again.

A careful examination revealed nothing wrong with his cage and he had plenty of seed and water, but he still kept up his signs of distress until at last it was discovered that a perch in a young bird's cage had fallen down. As soon as that was placed in position the old bird commenced singing again at the top of his voice.

On another occasion he manifested similar signs of distress and would not be quieted, and as everything about the young birds' cages seemed to be in perfect order, it was hard to account for his pitiful cries. But at last it was discovered that one of the water-cups had been so placed behind the wires that the birds could not thrust their heads through for drink. As soon as that was righted, all signs of distress ceased at once.

As fast as the young birds matured they were sold and taken away, mostly by one man from an adjoining city, and in a short time the old bird became so fearful of him that the moment he stepped on the plazza in front of the window, cries of warning and a constant fluttering were kept up until the man would leave the house.

One bird had just hatched a nest of little ones, and while they were yet very young the mother commenced laying again. But it not being deemed advisable to allow her to raise another brood so soon, the eggs as fast as they appeared were removed from the nest by inserting a spoon-handle between the bars of the cage. In due time the young birds matured, and together with the nest were removed from the cage. In a short time the mother-bird commenced building a new nest, but before finishing it she tore up two whole newspapers, with which the bottom of her cage was covered, and constructed a barricade across the side of the cage where the eggs had previously been removed. It seemed as though this must have been done with the intention of guarding her nest from further annoyance.

One lady who had never raised any birds had one sitting on a nest of eggs, and as she thought sufficient time had elapsed for the young to appear, she became disgusted and threw the eggs out on the ground, when she discovered that each contained a live bird. This seemed to incense the father-bird to such a degree that he never allowed the mother to make another effort to hatch a brood, but persistently rolled the eggs out of the nest and broke them as soon as they appeared.

One pet bird was always accustomed to take a nap after the noonday meal, and as her cage hung in a window where the sun sometimes came in quite warm, she would chirp until the shutter was closed. It so happened on one occasion that on closing the shutter the cage was loosened and fell to the floor, and birdie was picked up badly frightened; but after awhile she was returned to the same place and seemed as happy as ever, although she never again chirped to have the shutter closed.

Canaries, like human beings, often have a fondness for certain articles of diet. Some prefer bread and milk, others boiled egg, peppergrass, raw apple, etc.; and it often happens that if one of their number is supplied with any such dainty, the others will keep up a constant call until they are supplied also.

They seem to understand readily whenever any such dainties as they are fond of are brought into the house, and we believe they understand enough of our language to know when we mention such articles as they relish.

They learn to sing each others' songs very readily, and can be taught a great number of amusing tricks. We once saw one which would mount a pet chicken and ride around the room on its back, seeming to enjoy the sport highly. Another had been taught to "play dead," and when taken from the cage and laid on its back in one's lap and told to lie still, it would remain perfectly quiet for some time before making an effort to escape.

When Signor Blitz was traveling as a magician, he had a pair so well trained that they would sit perfectly motionless on the barrel of his revolver while he fired it before his audience.

We are therefore strongly inclined to the belief that they are capable of exercising the faculty of reason. IRA S. THOMSON.

National City, Cal.

BIRD SONGS.—It is proposed that a permanent record be made of the songs of birds by means of the phonograph. "This done," says a correspondent, "the song could be reproduced leisurely and 'scored' by a competent musician. Thus art and nature would go hand in hand."

GOOD HEALTH.

Effects of Poisons.

One of the most mysterious of physiological phenomena is the influence of minute quantities of certain substances when introduced into the circulatory system. The wonderful effect of vaccination is familiar to all, and even more remarkable are the terrible results produced by a mere trace of saliva from a hydrophobic animal—a poison which, apparently, remains dormant in the body for days, weeks, or months, and then suddenly springs into fatal activity. Similar effects follow from inoculation with the venom of serpents, but in such cases the poisonous effects occur almost immediately.

Even more powerful are the poisons used by the natives of Africa to render fatal the wounds made by their arrows, as described by Mr. Stanley in his recent work on Africa. These, when fresh, are of most extraordinary power. Faintness, palpitation of the heart, nausea, pallor, and beads of perspiration break out over the body with extraordinary promptness, and death ensues. One man died within one minute from a mere pinhole puncture in the right arm and right breast. A headman died within an hour and a quarter after being shot; a woman died during the time that she was carried a distance of a hundred paces; others, in varying spaces of time up to a hundred hours. The activity of the poison seemed to depend on its freshness. The treatment adopted was to administer an emetic, to suck the wound, syringe it, and inject a strong solution of carbonate of ammonia. This carbonate of ammonia injection seems to have proved a wonderful antidote if it could be administered promptly.

One of the poisons with which the weapons are smeared is a dark substance like pitch. According to the native women, it is prepared from a local species of arum. Its smell, when fresh, recalls the old blister plaster. It is strong enough to kill elephants. This poison is not permitted to be prepared in the village. It is manufactured and smeared on the arrows in the bush. All these phenomena are certainly wonderful and unexplainable; but for that matter, there is hardly any action taking place in the living body of which we can form any satisfactory conception of the true nature.—*Popular Science News.*

A MUCH-NEEDED ENTERPRISE.—San Francisco is to be blessed with a medical and surgical dispensary, one of the largest in the world, to be known as the Cosmopolitan Dispensary. The gentlemen in charge of the enterprise, who are men of means and great experience in medical matters, have leased and thoroughly remodeled the building at the junction of Market, Stockton and Ellis streets. There will always be in attendance a staff of eight physicians, six of whom will be in charge of the four consultation-rooms, which will be open to the public from 8 o'clock in the morning till 10 o'clock at night. Upon one physician, assisted by a pharmaceutical graduate, will be imposed the task of managing the medicine and express rooms, where all medicines intended to be sent to out-of-town patients will be prepared. The physician-in-chief will have charge of all correspondence, and will be assisted by 16 stenographers. All prescriptions will be carefully compounded by a skilled graduate, and all drugs will be bought at wholesale and retailed to patients at first cost. All correspondence will be kept perfectly secret and either burned or returned to patient. No charge will be made patients for examination, and if there is no cure the patient will be informed of the fact. The gentlemen in charge will only take cases they can cure, and whenever they fail to effect a cure they will make no charge.

HOW TO WATER PLANTS IN POTS.—Success or failure in the growing of house plants is largely due to the care and attention paid to watering. Like everything else, what is worth doing is worth doing well. When plants require water, give it unsparingly. The system to adopt is to be thorough rather than regular. Many persons water their plants as regularly as they wash their faces, which will not do. A plant should not be watered unless it needs it, and it does not need it so long as the soil contains sufficient moisture for the plant's use; more than that is an injury. Water should never be given until the plants show by the drooping of the leaves that they need it. Then give with a liberal hand, not simply a surface wetting, but give until every particle of soil in the pot is wet; let it go to the bottom. Many plants have been so long potted that the ball of roots and earth is almost impervious to water. Water applied to such, ten times a day, will do but little good; the pots should be put in a tub of water occasionally, and left there for 24 hours, the pot all under water, then they will get a wetting that is useful and lasting.—*Agriculturist.*

THE PHONOGRAPH AS A DISSEMINATOR OF DISEASE.—It is reported that the Philadelphia park commissioners have ordered the disuse of the public phonographs heretofore in use in Fairmount Park, on account of the danger of their serving to disseminate disease. This danger is doubtless very slight, like that of injury to the ear, and probably neither danger is worth consideration if the instrument is kept reasonably clean and used properly, but its promiscuous use in a public park does not seem to admit of perfect security in this respect, and the announcement that the phonograph company intends to substitute a plate ear-piece for the penetrating one now in use, avowedly for the reason that there are persons who object to the present form, goes to show that the Philadelphia commissioners are not the only people who entertain the idea of danger in the phonograph.—*N. Y. Med. Jour.*

FAITH AND MIND CURE.—Charles Dudley Warner is quoted as saying that the difference between "faith cure" and "mind cure" is that the "mind cure" doesn't require faith and the "faith cure" doesn't require any mind.

DOMESTIC ECONOMY.

Apples Properly Cooked.

We have learned the value of the apple as an every-day luxury, and have them to use freely. We begin on green fruit in August, and I have good, sound Roxbury russets in my cellar in July, and shan have them till nearly the end of the month.

I call cooked apple a luxury on the table at any time. I use the term "cooked," for stewed, mashed, mangled, murdered apple is not good at any time of the year. An apple that has flavor should not be cooked till all the flavor passes off in steam and nothing is left but pulp. My housekeepers are taught to pare, cut and quarter every morning for use during the day. When to be cooked, they are put in a tin pan or other broad-bottomed vessel and set on the stove or cooking lamp with a little water in the bottom. The apple in the vessel should not be more than ten inches deep and should be covered tightly to keep in the steam. They will cook very quickly, and just before the top ones get soft, sprinkle over sugar, cover again and set away to cool. The quarters should not fall to pieces. Cooked in this way they are delicious. Many a cook in the farmhouse needs to understand the right way of cooking apples.

In the fall and early winter we leave the peel on, especially if it is high-colored, as the best flavor is next to the skin. I don't allow apples pared with a knife; they should be pared with a machine that takes a thin peeling.

I believe farmers in general, and their wives in particular, do not value cooked apple as an article of diet as they should. Less tea and coffee and more apple, no doubt, would conduce to longevity. So much sweet is used nowa days, I think the acid of the cooked apple is needed to keep up good digestion. I have no doubt the free daily use of cooked apple would diminish the use of hard cider. This beverage is craved most in springtime, when the system is inclined to be bilious. Take pains to have a full supply of apples at this time and use them freely, and no excuse can be got up for frequent visits to the cider-barrel. The cider is best kept within the peel of the apple; kept there, it can be taken into the system in its normal condition and appropriated to a useful purpose. I want no barrels tighter than common flour-barrels to hold my cider.—*Z. Breed in New England Farmer.*

GOLD FEATHER CAKE.—One and a half cups sugar beaten to a cream with half a cup of butter, half a cup of cold water, two cups sifted flour, one and a half teaspoons of baking powder, three eggs. Flavor with one teaspoonful of lemon extract.

VANILLA SNOW.—Cook one cupful of rice in a covered dish to keep it white. When nearly done, add one cupful of cream, a pinch of salt, the beaten whites of two eggs and a cupful of sugar. Flavor with vanilla. Pile in a glass dish and dot with jelly. Serve with cream and sugar.

SUGAR CAKES.—One cup butter, one cup sugar, four cups flour, two eggs, one teaspoonful vanilla. Cream, butter and sugar, mix with the beaten eggs, add the flour and the flavoring, roll out very thin, and bake in a moderate oven, sprinkling the cakes with granulated sugar just before baking.

CROQUETTES.—A nice way to use cold beef for supper or luncheon is to take one pint of chopped beef, four medium-sized potatoes, juice of half a lemon, half a cup of stock or hot water, one teaspoonful of onion juice, salt and pepper. Mix all together, shape nicely, dip in beaten egg and cracker crumbs, and fry in boiling lard two or three minutes until they are a delicate brown.

CREAM COOKIES.—To one cup of thick, sour cream add one teaspoonful level full of soda, one and one-half cups granulated sugar, one egg, one heaping teaspoonful of baking powder, a pinch of salt, caraway seed or any other flavoring you prefer, and flour enough to make a stiff dough; roll out thin, sprinkle sugar over it, and pass the rolling-pin over; cut out and bake quickly.

SMALL CUCUMBER PICKLES.—Wash and wipe 100 small cucumbers, and place them in jars. Cover them with boiling brine, strong enough to bear an egg; let stand 24 hours. Then take them out, wipe, place in clean jars, and cover with hot vinegar spiced with an onion, 12 whole cloves, one ounce of mustard seed and three blades of mace. They will be ready to use in two weeks.

The Week.

The great overshadowing event of the week in the metropolis has been the Admission Day celebration, under the auspices of the Native Sons of the Golden West. The events of the celebration, outlined in our last issue, were carried out with a volume and enthusiasm exceeding the anticipation of the most sanguine, and the occasion will not be forgotten by the present generation of Californians. There was wonderful breadth to the event because of the participation of good delegations from all the sides and corners of the State; delegations of stalwart youth, filling mile after mile of the procession; delegations of gray-bearded Pioneers—a greater number of them probably than ever convened before in the history of the State. The Native Daughters and their beautiful mothers were also present in force, and gave the events a grace and social significance, an inestimable contribution to the general success of the celebration. It is estimated that in the grand parade, the crowning event of the week, there were not less than 25,000 persons participating, and it occupied two and a half to three hours in passing a given point. It is the popular judgment that San Francisco never witnessed anything like it in extent, variety and spirit. The Native Sons have shown themselves worthy of their birthright.

VIEW IN THE PALISADES ON THE COLUMBIA RIVER.

The American Race.

We have none. We are one people only by law, language, industry and commerce. In all else we are wide apart. Race, color, religion, thought, habit and condition, oh, how wide apart! We are gathered from the ends of the earth and exhibit specimens of the highest and lowest degree in all.

But come back here in a thousand years and you shall find all this vanished into thin air. We shall be one race—the American race. All trace of these distinctions will have passed away. There will be only one blood, bone, flesh, color and form—the American people will be one great family.

In a thousand years the white blood will have worked down among the darkest and lowest, and the black, Chinese, Indian and other blood will have crossed and streaked the first families. They will all be one flesh and the distinctive features will have passed away.

What will that race be? White, without a doubt, from light blonde to dark brunette. But all will pass for white. The prevailing element, the wealth, education, mental force and mastery and the numbers of the whites will make them the type, the race; but all the rest will leave their mark, here weak, there strong, but seen more or less all round.

Shall we be a superior race? How shall we compare with Europe, with the English, French, or German? Will the pure or the mixed prove the superior? Will there be a white race anywhere that will loom up above us and look down upon us as we do now upon the Chinese? Who can tell? History gives us no guide, no solution of this question. Pure races yet stand at the head of civilization.

Among ourselves, blot out the white element, and we should step down from the front rank among the nations; England, Germany or France would soon regard us as an easy prey; and when the mixture is thorough, and we are one people with all this mixed blood, shall we still hold the first place or drop to a second or third, and look up to the purer blood of Europe as something away above us?

We would none of us wish to have it. We are proud and we shall always be proud to be called Americans. We would have the American race first in the world. We would all be willing to do something to make it so. What can we do?

We cannot avoid the mixture of our races. It is not possible. The proudest family in the land cannot do that. For a time, perhaps; in the end, never! Time will bring us all into one pool. Beauty, talent, wealth and erratic love will do that for us in despite of all our efforts to prevent. A thousand years is a long time.

There is probably not a man in England who could not trace his lineage to King Alfred, and also to the shepherd who kept his herd.

Again, then, the question recurs, what sort of a people shall we be in the year 3000? We are working out the problem now. We are fixing the factors. We are mixing the dough to make that bread, and settling whether it shall be white, brown or black, and what it shall be in all other respects.

If we are wise we shall be very sparing of inferior elements. We shall close our doors in the face of all who will tend to degrade us. If they come they will increase and leaven the whole lump, as we have seen. Is it not enough to make us resolve "that no more shall come to stay and live among us who will not tend to improve rather than deteriorate our general average"?

We should begin this work now. Begin with the lowest, the most objectionable, and let the work of exclusion go on till none can come among us who bring objectionable form, defect or disease.

There is no fear that our numbers will suffer by this process. Indeed it is certain that within two centuries the tide of population must set away from us, for the reason that we shall be too thick upon the ground.

God made mankind so prolific as to stand the wear of savage life in the woods, and still hold their own and increase a little all the time. When war, famine, pestilence and death by wild beasts are removed, almost entirely, as with us, we increase very fast. Some aver that we may double every 25 years, till want of space forbids.

Now let us make it 50 years, to be sure, and what remains? In 1990 we shall be 80,000,000; in 1950, 160,000,000; in 2000, 320,000,000. We shall still be less than 50 to a square mile, and may double again before the year 3000. But that will perhaps be all we can do.

Numbers are no longer an object with us, either for strength or progress; and the time is not distant when we must not only accept none from the outside, but must begin to prune those within, with a view to maintain the purity of our race and security for our peace, happiness, liberty, and our republican institutions.

Oregon Scenery.

The beauty of the Northwest is the theme upon which every visitor delights to descant. It is of a type wholly different from that of California, and it is conceded, we believe, to be far more grateful to the eye. The whole Pacific Coast is, however, so well endowed with Nature's best work that comparisons are needless—each has enough to stimulate and ennoble all who attune their hearts to Nature's sublime lessons.

The Northwest has many scenic features, but the scenery of the Columbia has commanded the greatest effort from poet and painter, and it is indeed grand and entrancing. Our photoplate gives a glimpse of a beautiful scene in the palisades. Of the scenery of the Columbia an admiring local writer has penned these words:

The Columbia river passes through a country which, among other features, affords the grandest and most picturesque of scenery. Tourists who have traveled in many countries pronounce the ride up the Columbia from Portland the finest within the range of their experience, and even declare the scenery to be the most magnificent along any river on the globe. The Columbia receives its large tributaries, with the exception of the Willamette, before breaking through the Cascade mountains. The whole course of the Lower and Middle Columbia is through a mountainous country. The towering rocks, abysmal chasms, wooded cliffs, gloomy caverns, cascades and cataracts are made familiar to the voyager on the Columbia, who can spend any time he chooses at specially interesting points along the shores.

The palisades of the Hudson, the pictured rocks of Superior, the rugged crags of the Alps, the picturesqueness of the Rhine, the deep wildness of the Amazon, combine on the banks of the Columbia to make a continuous scene of rare beauty and sublime grandeur. The steamers, which ply regularly on the river, carry thousands of delighted tourists annually through this American wonderland, any attempt to describe which only makes evident the poverty of language.

Why Not Plant More Native Conifers?

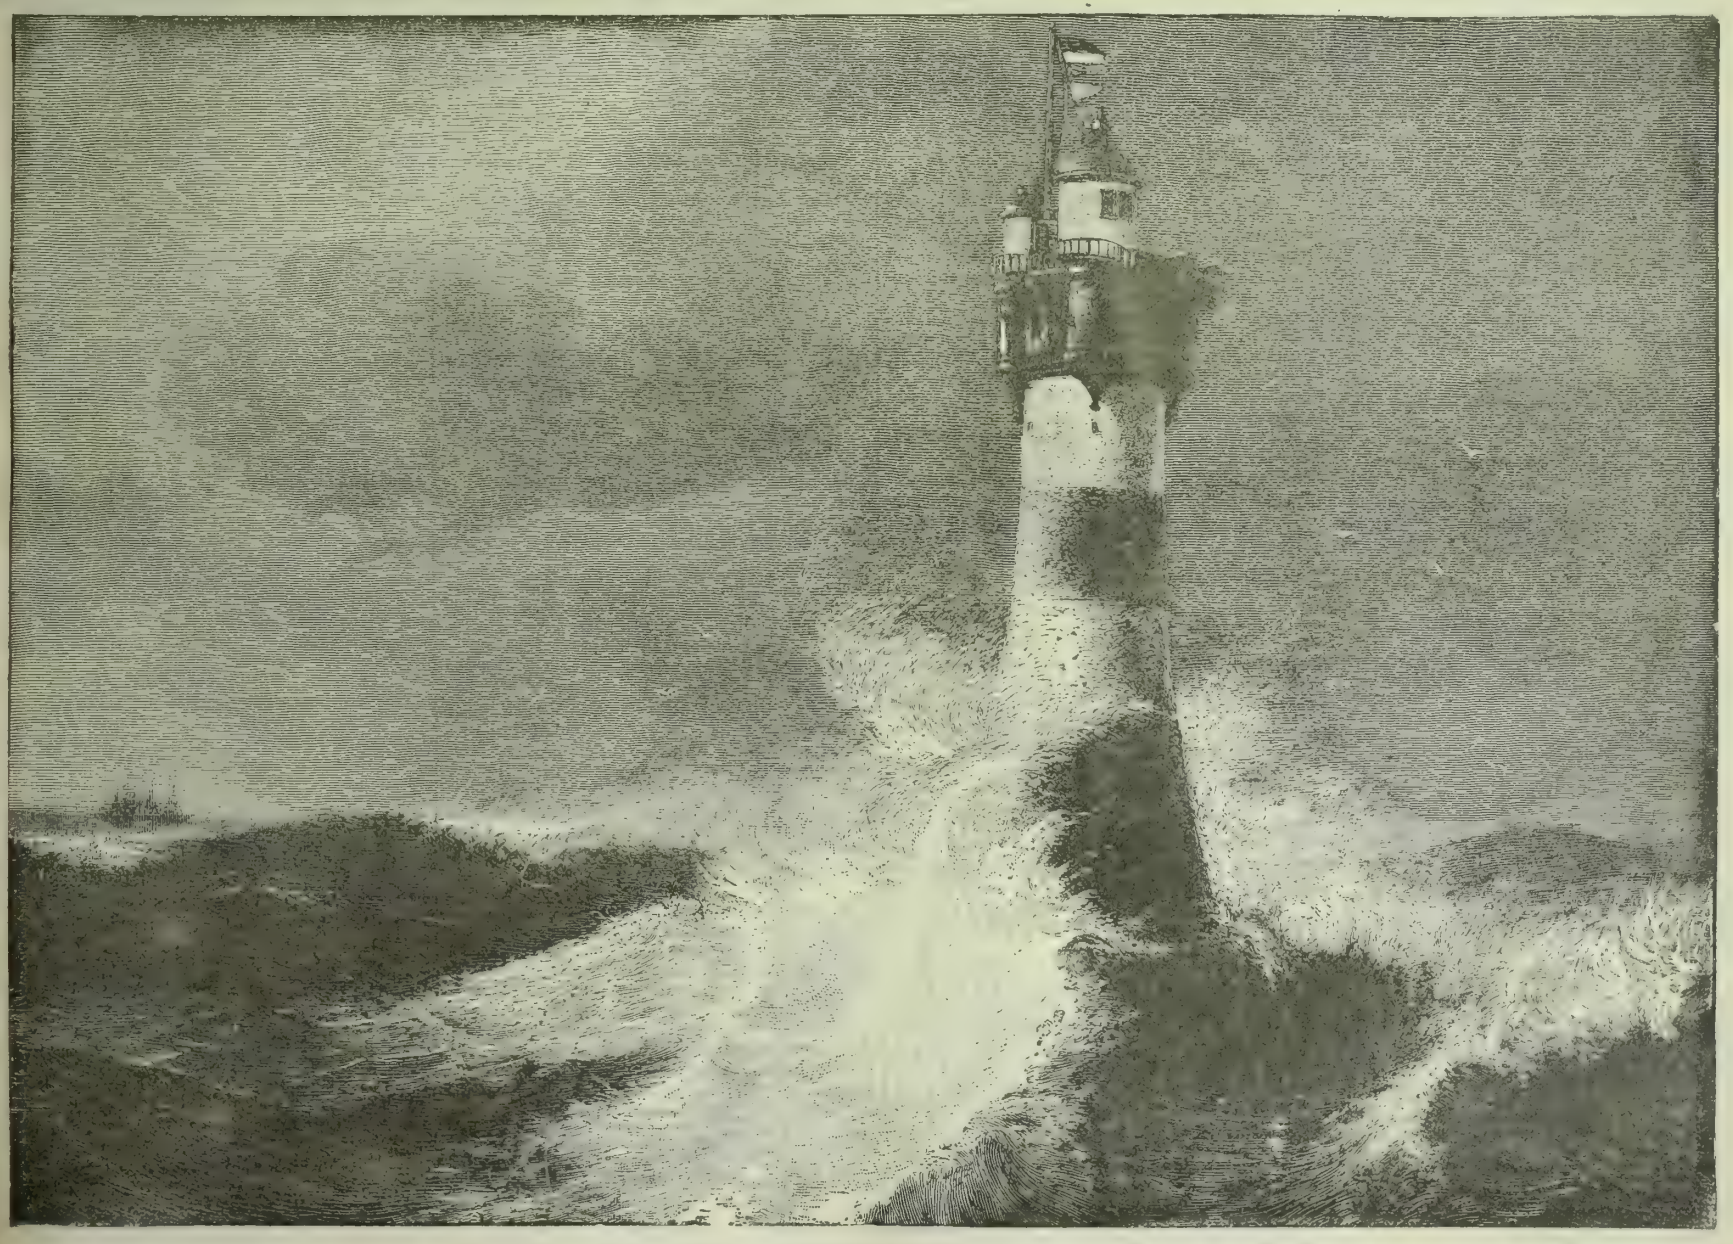
[Written for the RURAL PRESS by WILL C. AIKEN.]

In a recent trip through the central and southern portions of the State, the absence of our native *conifera* was generally noticeable in the valleys and cultivated areas. The different palms, as well as the Australian trees, the pepper and the eucalyptus, have everywhere been the favorites for planting. Of course, there are some supposed reasons for the choice of these trees. They are handsome and give to the landscape a semi-tropic air; they are all quick-growing and therefore find favor; but that they have been propagated more largely by nurserymen and hence are easily procured is another reason why they have been so liberally planted.

The Monterey cypress and pine are occasionally found, as well as the *Araucaria Excelsa* (Norfolk Island pine), and these have grown thriftily in all locations; but that the palm and the pine are not more frequently seen side by side is a subject of remark.

Some of our grandest conifers have been quite neglected, namely, the incense cedar, *libocedrus de currens*, and that noble spruce, *abies Douglasii*. In their native voluntary state these trees are found in moderate altitudes, but that they thrive at sea level and wherever propagated is well known. The first named has been planted to some extent around Fresno and elsewhere, but the Douglass fir or spruce is, if anything, less known. When left to itself on dry slopes where the seed starts, this evergreen is of comparative slow growth, but with care and cultivation in the nursery row, it makes a more rapid growth. A specimen growing in adobe soil in Berkeley, that is probably not over six years old, and which has been entirely neglected, has made an excellent growth and is now a good-sized and beautiful tree, showing some of its possibilities under quite unfavorable circumstances.

I noticed some excellent though small specimens in the Sierra Madre hills above Pomona, though not yet old enough to bear seed that would germinate.



With us, on the mountains north of San Francisco, the Douglasii is our grandest forest tree, standing as an effective barrier against the northers and autumnal storms.

St. Helena.

GRAPE SYRUP.—According to the Yolo *Mail*, the manufacture of grape syrup is being brought upon a profitable basis by Snavely & Baker of the Woodland winery. They hold their process as a secret, but they report results as follows: "The syrup made by us last year went like wildfire, and we have several orders from the East, one from Washington, D. C., for two carloads, which will soon be shipped. We receive 55 cents per gallon for the liquid. This is the top price. We take great pains with our work, and will this season make 25,000 gallons, against an output of 20,000 gallons last year." The syrup-makers are reported to be offering $11 per ton for grapes, or $2 more than they paid last year. Samples of this season's syrup will be placed in the Yolo exhibit at the State Fair.

Eddystone Lighthouse.

The Eddystone Lighthouse is built upon one of a group of gneiss rocks, daily submerged by the tide, in the English channel, nine miles off the Cornish Coast and fourteen miles south-southwest of Plymouth breakwater. The frequent shipwrecks on these rocks led to the erection of a lighthouse on them by Mr. Winstanley, 1696–1700. It was a wooden polygon, 100 feet high, with a stone base; but a storm in 1703 completely washed it away with the architect. Another lighthouse was built 1706–9, also of wood, with a stone base, and 92 feet high, by Mr. Rudyerd, a silk-mercer. This erection was burned in 1755. The present building, known as the Eddystone Lighthouse, and noted for its strength and the engineering skill it displays, was constructed by Mr. Smeaton in 1757–59 on the model, it is said, of the trunk of the oak tree. It stands on the sloping side of one of the rocks and is built of blocks, generally one to two tons weight, of Portland oolite, encased in granite. The granite is dovetailed into the solid rock. The whole forms a circular tower 85 feet high; the base is 26¾ feet in diameter and has 13 feet of solid masonry on it, and the tower contracts to 15 feet diameter at the top. The light, a fixed one, 72 feet above the water, is seen at the distance of 13 miles. As the rock on which the tower stands is worn and greatly weakened, the lighthouse is to be taken down and rebuilt on another part of the reef.

THE EDDYSTONE LIGHTHOUSE.

HOP LICE IN OREGON.—A dispatch from Eugene City says that Prof. Washburn of the State Agricultural College visited the hop-yards on McKenzie river, Lane county, last week for the purpose of ascertaining as to the presence of the reported hop louse in the yards of Lane county, and that he found the genuine hop louse (*phorodon humuli*) in considerable numbers.

Notes on the Fairs.

Marysville—13th District.

The fair for the 13th Agricultural District—now embracing only Yolo, Sutter and Yuba—came off last week at Marysville. The *Bulletin* correspondent observes: The display of fruit in the pavilion this year is up to the high standard of excellence maintained by the horticulturists of the district, and there is a great deal of it on exhibition. Every description of deciduous fruit grown in California is well represented here, and the citrus family find representatives in a pile of green oranges, which, even at this early date, are almost the size of baseballs, and in the course of another month would be turning yellow on the trees. The orange orchard of 100 acres, six miles south of Marysville, on the open plain, is making a vigorous growth, having passed its first winter without the least injury from frost. The fine fruit and big vegetables shown in the fair were all grown without irrigation.

One hears at the fair more talk about fruit than anything else, and the coming season is likely to bring some extensive planting of deciduous fruit trees. The farmers all admit that something more profitable than wheat is needed, but not very many of them in this part of the State have yet cut loose from the grain-growing habit. If you argue that alfalfa, orchards or vineyards pay far better than grain, the fact will be readily admitted. "Yes, I know it," said an old farmer to-day; "but I know how to grow wheat, and I don't know anything about alfalfa or fruit." The past wet winter was severe upon some of the best orchards on the Feather river, and greatly lessened their yield of fruit this season. But the experience has been valuable and on lands liable to become excessively wet, the Bartlett pear will succeed stone fruits.

Perhaps the most interesting exhibit in the pavilion here this week, from a strictly agricultural standpoint, is a big bottle of sorghum syrup. It is a clear, amber substance, thick and heavy. Its flavor is excellent. It is remarkable for the absence of that slight degree of acidity commonly found in such syrup, and which many persons suppose to be a necessary characteristic of sorghum. Many gallons of this syrup have been sold at retail by the maker. His price is 75 cents a gallon, and he can see millions in the business at a much smaller price.

Inquiry suggested by a bale of alfalfa at the stock grounds brings out the information that a piece of land near Yuba City is paying from $75 to $100 an acre in alfalfa. It is not river bottom, and is not irrigated. There are occasional bunches of alfalfa in bloom on the top of the Marysville levees from seed accidentally sown. The roots of these blooming plants must go down 10 or 15 feet for moisture.

Outside of the pavilion, interest centers in the racetrack, where the "speed trials" excite as much attention as usual, and hundreds of people there attest devotion to agricultural pursuits and rural joys. With a "wheel of fortune" and other facilities for losing money, the industrious farm hands have sufficient opportunity to get rid of their hard-earned harvest coin. Mere "literary exercises" are dispensed with in the fair program of this 13th district. There is no opening address nor intrusion of essays on agriculture or horticulture. No premiums are offered for the best yields of any description of farm or orchard products, or for descriptions of new processes or improved methods. If the visitor to the fair desires information of any of the methods by which the results he sees were obtained, he must get it by personal application to the grower. There are no written descriptions embodying such information. The educational value of the District Fairs could be greatly improved by attention to matters of this kind, and the innovation would not give rise to any injurious or dangerous competition with the races. It has been suggested that if the races were held subsequent to the pavilion display and the exhibition of live-stock, more benefit might be derived by the farmers, and that, in such case, their attention would not be diverted from the more strictly agricultural features of the fairs by the horse-races. But the answer to this suggestion is that the farmers would not come into town until the racing program opened. The experiment, however, might well be tried.

The display of cattle at this fair is not so large as usual, but a good representation of heavy horses for farm work is made. The sheep industry is represented in no more direct way than by the exhibit of fine blankets and other goods from the Marysville Woolen Mill. Of poultry, a foothill farmer shows fine specimens of noted breeds, and says that this season he has filled orders for 600 fowls of high degree. Some beautiful displays of flowers are to be seen in the pavilion, and the decorative efforts are in general good.

Taken as a whole, the fair is regarded as a success from every point of view, and the management have worked hard to supply the usual range of attractions and facilities for the public.

Arroyo Grande, of course, contributed heavily to the showing of vegetables, fruits and

(*Continued on page 237.*)

AGRICULTURAL NOTES.

CALIFORNIA

Alameda.

MAKING HIS OWN BRAND.—Livermore, Sept. 4: J. E. Stover will dip his Muscats this season, and expects to make a large pack of raisins. He proposes to establish a brand the leading attraction of which will be the beautiful amber translucency of the raisins, owing to the dipping process to which the grapes are subjected.

HAY SPOILING.—Livermore *Herald*, Sept. 4: The farmers of the Altamont region have a genuine grievance. They are baling and shipping their hay and can get no cars. Other sections are in a similar fix, but as there are practically no hay warehouses at that point, and hay is the only crop produced, the position of the Altamont farmers is unique. Their hay is bleaching and losing in weight and value daily, while they are unable to either ship it or get it under cover. They file orders daily for 25 cars and get two or three. There is a general scramble for these, with a good likelihood of engendering bad blood. The platform of the depot is piled to the roof with hay, and a portion of it has broken down under the load. Hay is everywhere and cars are nowhere.

FOOD FOR CATTLE AND HOGS.—Livermore, Sept. 4: Some of our farmers should experiment with the carisa plant in their wet gulches. Wherever there is a stream of water, however small, the carisa will grow to an enormous size, and as it is an excellent fodder for cattle and probably for hogs, it should prove of great value to the farmer. If it grows as it promises from the few specimens in our town, a half-mile of wet gulch would produce ten tons or more of fodder. This land is now comparatively worthless. Suckers can be procured in this place, and a few plants will soon supply all that are needed. The crop is cut annually, the roots living in the ground. There are hundreds of such gulches on our hill farms, and we believe they could be made very remunerative in this way.

Contra Costa.

FRUIT PROFIT.—Martinez *Democrat*, Sept. 3: Our fruit-growers express themselves well pleased with the result of this year's fruit crop. The crop of French prunes was remarkably abundant and of fine quality. Peaches were sold at four cents per pound by the box, and we think we have never seen any better in size or quality. Bartlett pears have also been sold at very satisfactory rates.

El Dorado.

LAND TROUBLES.—Placerville *Republican*, Sept. 4: The United States Circuit Court some time ago rendered a decision affecting the title to all lands in the odd sections granted to the Central Pacific Railroad Co. which had been obtained under mining applications from the Government subsequent to the grant. The effect of the decision was to confirm to the railroad company all lands in the grant, whether mineral or agricultural, from the time the grant was made, and to vitiate the title of lands held under mineral patents. Following this decision, the railroad company has notified owners of such land, a number of whom reside in this county, that suit will be commenced against them to recover the land which the company claims under the grant from the Government.

Fresno.

RAISIN ITEMS.—Oleander, Sept. 3: Our two packing-houses, the Curtis Fruit Co. and the Fresno Raisin Co., are hard at work getting ready to pack the largest pack of any season yet. Our vineyards are all dotted over with dark human beings picking the luscious fruit from the vines, and by the looks of the well-filled trays, it has every appearance of an increased crop this year. Some of us have had trouble with Chinamen this season. The talk is now that we will try to be prepared for white help another year.

Lake.

FRUIT LAND.—Middletown *Independent*, Sept. 6: It is remarkable that more land is not purchased in the southern portion of Lake county. Good fruit land can be purchased at from $20 to $60 per acre, which, if in Napa county, would readily sell at $200. Finer fruit cannot be raised in any portion of the State, but still people do not care to invest simply because we have no railroad. Our advice is to buy now while land is cheap, as this county demands a railroad, which will be built long before trees would come to bearing if planted this winter.

Los Angeles.

GRAIN SHIPMENTS.—Redondo, Sept. 1: Every day, for several weeks past the steam thrasher has been at work in the great wheat and barley fields around Redondo. Vast quantities of grain have passed through the thrasher. Redondo is consequently enlivened by long lines of six-horse and mule teams drawing load after load of sacked grain to our pier for shipment. Within the past six days there has been shipped nearly 7000 sacks of grain and fully as many more are piled upon the wharf awaiting boats. Seven thousand sacks are still to come from the Dominguez ranch.

FRUIT BONANZA.—L. A. *Express*, Sept. 4: As showing what can be realized from the industry of fruit-growing in Los Angeles county, the information furnished by Ernest Dewey of Pomona, in the blanks sent to him by the Chamber of Commerce, is authentic and instructive. Mr. Dewey has six acres in prunes, from which he gathered 38 tons of that fruit. He sold it dried at 10 cents a pound, realizing $3147. The cost of production was $403, leaving a net profit of $2744. The amount of water used was one inch to ten acres. The soil was a sandy loam, and the increase in production and price compared with last year 50 per cent. In Golden Cling peaches he did still better. He has ten acres of seven-year-old trees. From this he produced 47 tons of green fruit. He sold them dried at 20 cents a pound, realizing $4800. The cost of production was $243.70, leaving a net profit of $4556.30. The fruit was raised in a sandy loam soil without irrigation.

TWO CROPS.—Florence, Sept. 4: Some of our farmers have harvested a fine crop of barley this season, and have now on the same land an immense crop of corn. With proper irrigation and cultivation it can be made to yield equal to any spot in the quantity and quality of its products.

LARGE SHIPMENTS.—Florence, Sept. 4: Within the last three months about 350 carloads of vegetables have been shipped from our little station, and ten carloads of barley during the past month.

FRUIT PROFIT.—Long Beach *Breaker*, Sept. 6: Mr. Sexton sold 122,000 lbs. of Royal apricots for $1525 from 290 trees—less than three acres. R. F. Cunningham sold $3000 worth of peaches from ten acres he offered for sale at $2700 with no taker. William Edmunds sold two acres of Bartlett pears for $1132, at $75 a ton. Ten acres of peaches produced from seven-year-old trees 48 tons of fruit. Amount realized from sales, $4800; cost of production, $243.70; net profit, $4557 30. Six acres of prunes produced 38 tons of fruit. Sales, $3141; cost of production, $403; net profit, $2784. Both of the above crops were raised without irrigation. Total amount of net profit from 16 acres, $7294 30. "Does fruit-raising pay?" N. Hayden's 3½ acres and another one-half acre produced this year 685 boxes of oranges, 15 boxes lemons, 8000 lbs. apricots, 2200 peaches, 200 loquats, 2500 nectarines, 4000 apples, 1000 plums, 1000 prunes, 1000 figs, 150 lbs. walnuts and 500 lbs. pears. The total receipts amounted to $4650. The above is vouched for at home.

LAND ADVANCING.—Pomona *Progress*, Sept. 4: The Jackson orchard, that was offered for sale for $350 an acre, was withdrawn from the market last month. The crop from the place this season sold for $277 an acre, and the property had little or no care, either. A gentleman offered $420 an acre for the orchard last week, and the offer was declined.

Mendocino.

HOPS.—Ukiah *Dispatch and Democrat*, Sept. 5: The ruling figure for hops in Ukiah this week has been 32 cents. We are informed that Wm. Clark of this valley has sold his hops for 32 cents a pound. T. R. Lucas of Ukiah valley has sold a large quantity of his hops for 30 cents a pound.

Napa.

GRAPE PRICES.—St. Helena *Star*, Sept. 6: E. J. Van Vleet has sold about 50 tons of table grapes to the Napa Valley Fruit Co. at $30 per ton, and work has already been commenced gathering and packing them. We understand that that company is buying up a great deal of fruit in this valley this year, shipping it direct to the East and paying to the producer a liberal price.

Orange.

OSTRICH FARMING.—Santa Ana *Blade*, Sept. 4: The property of the California Ostrich-Farming Co. of San Francisco is located about 1½ miles southeast of Fullerton. We found 120 full-grown and 54 young birds of all sizes on the farm, and as the keepers were just commencing to feed them, we were kindly permitted to visit the various inclosures in which the birds are kept. Edward Atherton, one of the keepers, informed us that the original "plant" consisted of 18 ostriches, imported from Africa at a cost of $18,000, or $1000 per bird, and of this number two have died. The older birds are kept in pairs, while the younger ones of about the same age are kept together.

San Benito.

LARGE BULL.—San Benito *Advance*, Sept. 5: The Bonnie Brae Co.'s prize Holstein bull was placed on the scales of the warehouse company yesterday, and tipped the beam at 2240 lbs.

San Bernardino.

FIG PRICES.—Ontario *Record*, Sept. 3: Ontario's fig crop is not large, but those who have trees enough to give them a surplus for sale are realizing $50 per ton for the green fruit. Barnard & Benedict of Los Angeles are the purchasers.

San Diego.

CITRON CULTURE.—National City *Record*, Sept. 4: F. A. Kimball has received from the Department of Agriculture a large consignment of the citron tree of commerce, which was shipped from Naples and Calabria. Two shipments were made—one of 400 and the other of over 1300 pounds, and of these, only two trees were lost. With them came a list of the persons to whom they were to be distributed, but there are still a few left which will be given away to persons living in favorable localities. Mr. Kimball himself is going to test the growth of the tree in this climate quite extensively. He has men and teams at work grading ten acres of land, directly west of Col. Dickinson's, in which will be set out the Sorrento, Calabria and Amalfi varieties, and in a second ten acres to be put in condition soon, these and the Macrocarpo, Pome d'Adamo, Icompio, Pereltone and Citrus Medica will be set out.

Santa Barbara.

SUCCESSFUL FARMING.—Lompoc *Record*, Aug. 30: A man to be a successful farmer must watch the markets and farm intelligently. The most notable success in our colony is that achieved by I. M. Clark, who cleared $1750 from seven acres of potatoes last year, and is now clearing $300 per acre on onions. Mr. Clark has never made a failure, and attributes his success to a close watch of the markets and in adapting his crops to the soil.

Santa Clara.

SHIPPING FRUIT.—San Jose *Times*, Sept. 6: One of the busiest places in the city yesterday was J. Z. Anderson's packing and shipping house. One hundred and fifty thousand crates closely packed in cars, arrived yesterday afternoon. They are to be used in packing and shipping grapes, which will soon begin to come in for attention. Five carloads of fruit daily are being sent from San Jose by this house. Fall pears, peaches and plums now form the bulk of the shipment. Goodell combined refrigerator and ventilator cars are being used for the shipment. These cars are constructed with large troughs in the top which are filled with ice. The air is permitted to blow through ventilators at either end. These ventilators are closed during the journey and only opened when the fruit is near its destination. Air is then permitted to circulate freely through the car, thus removing the "sweat" which collects on the fruit during its close confinement. Much of the finer fruit is packed in tissue paper before shipping.

AN ORCHARDIST'S SUCCESS.—San Jose *Times*, Sept. 4: S. A. Moulton's fruit-drying work, at Campbell's, has been putting out from 50 to 60 tons of prunes each day for the last ten days. During the season they will dry about 1200 tons of prunes. They have also turned out a large amount of apricots, peaches and plums. This immense business has grown almost by itself. Five years ago Mr. Moulton concluded to dry the fruit on his orchard of 15 acres. He was so successful that the next year he bought the fruit of his neighbors and the next year he bought more. He saw the business increasing rapidly and purchased 11 acres of vacant ground on the railroad and erected the present works. He is likely to double his operations next year. He employs none but white labor, and utilizes women and children whenever possible. About a hundred names appear on his pay-roll during the season.

San Joaquin.

GRAPE SHIPMENTS.—Stockton *Independent*, Sept. 5: W. E. Aiken makes a regular business of shipping fruit from here to New Orleans and San Antonio, Texas. Grapes are at present engaging his attention, and he shipped one carload Wednesday, another yesterday, and will ship two more today. He finds difficulty in obtaining cars enough for his purpose. He says that New Orleans and San Antonio will each take three cars a week, but he cannot always get cars when he wants them. The varieties in demand are the Black Prince, Black Hamburg, Tokay and Muscat Alexandria. The price per ton ranges from $35 to $45.

Shasta.

A TRANSFORMATION.—Anderson *Enterprise*, Sept. 4: One fact some of our people are just beginning to learn is, that we have no poor land, though they have been decrying it for years as worthless and discouraging settlers from taking and improving it. Happy valley, which a few short years ago was a wilderness where nothing would grow but chaparral, manzanita, poison oak and scrub oak, has hauled to the cannery, from her many magnificent small orchards, ton after ton of the choicest fruit ever seen; and this fruit is not confined to one variety nor two, but takes in the whole catalogue of fruit plants. Anything that has good roots and the fruit germ will thrive there and bear fruit.

Solano.

THE ALMOND CROP.—Dixon *Tribune*, Sept. 6: R. E. L. Stephens informs us that his almond crop is very promising this year. The hulls are bursting open better than usual, and the nuts appear to be of an excellent quality. His crop will be gathered next week, and he expects from 75 to 100 sacks.

Sonoma

FRUIT FOR DRYING.—Santa Rosa *Democrat*: At the fruit-driers, Monday afternoon, the quotations were as follows: Apples per ton, $12@20; plums, $20@40; peaches, $30@45; prunes, $40@51; pears, $12@14—the preference being given to plums and prunes. Of the latter, a large quantity is being handled. Bannerman Bros. & Elder have a contract with Mr. Crawford to cure his entire prune purchase this year. They have over 40 tons of fruit in the process of drying at present. The prunes this season are of an unusual size, many of them averaging only 20 to the pound.

Tulare.

LARGE FRUIT YIELD.—Visalia *Times*, Sept. 4: We publish an affidavit from C. W. Clarke of the well-known firm of Cox & Clarke of Sacramento, as to the product of a tree in the Briggs orchard, four miles southeast of Visalia, where the gentleman witnessed the gathering of the fruit, saw it run through a cleaner and deprived of leaves and twigs, and then saw it weighed. Other reliable gentlemen were present and testify to the statement of Mr. Clarke, and all concur in the statement that the prunes from this one tree weighed 1102 pounds. The tree from which the fruit was gathered was set out in orchard only six years ago, and there are numerous other trees in the same orchard, of the same age, that are as heavily laden with prunes, and other trees that probably contain more fruit than did the one particularly mentioned.

BIG YIELD OF GRAPES.—Visalia *Delta*, Sept. 4: W. F. Kelsey, living about 3½ miles from this city, set out 200 acres in Muscat grapes on his place last spring. The vines have borne two crops already, and another crop is in bloom. It seems as if the soil is specially adapted for grape culture. Mr. Kelsey has a vineyard which is certainly a marvel. When the vines reach their maturity the grapes will yield six, seven and eight tons per acre; in fact it is thought the crop will be ten tons on some acres. When it is stated that Muscat grapes are sold for $20 per ton, one can figure mentally the profit. Mr. Kelsey states that a Fresno gentleman, well posted in grape culture, says his vineyard will yield $100 per acre next year.

WHAT IT REQUIRES.—Visalia, Sept. 4: It requires usually 5½ to 6½ pounds of green peaches to make one pound dried, and 2½ to 3 pounds of prunes from the trees to make a pound of the dried fruit. Prunes can be picked and dried ready for sacking at a cost of about a quarter of a cent a pound. It costs about eight cents per 100 pounds to gather peaches, and to pick, cut and dry them costs about 20 cents per 100 pounds.

DIVERSIFIED FRUIT ORCHARD.—Visalia, Sept. 4: At the fruit farm of Jos. Spier & Son in Visalia, there are growing, in addition to many varieties of peaches, plums, prunes, pears, apples, etc., California and Eastern black walnuts, butternuts, Japanese and Italian chestnuts; also bearing olive trees, a fine bunch of bananas, and in the nursery are 10,000 orange seedlings. The last ripe oranges were picked from his trees only a few days ago.

FIRST OUTPUT FROM THE CREAMERY.—Visalia, Sept. 4: The Visalia creamery, under the management of J. G. Cohoe of Hanford, commenced the manufacture of cheese on Monday morning, and starts out under most favorable circumstances. There were 2312 pounds of milk delivered early in the morning, and before the noon hour arrived there were 12 cheese in the press—eight large and four small ones.

SACKING RAISINS NOT GOOD ENOUGH FOR PACKING.—*Register*, Sept. 6: Erwin Brothers will sack their raisins. The reason for this is that the greater portion of their vines are too young to produce large bunches and consequently the pack would not present the appearance of the first grade of raisins. Messrs. Erwin are starting out with the purpose of establishing a permanent business and they do not wish to send out anything which is not able to hold its own with the best.

RAISIN ITEMS.—Traver *Advocate*, Sept. 4: The curing of raisins has been commenced in the colonies hereabout, and trays and sweat-boxes are in great demand. These latter are going to be scarce and the manufactured article is not to be had. Horticulturists who have not obtained a supply will have to turn carpenters and make their own boxes, etc. The mills at Madera and Sanger have all the orders ahead that they can fill and refuse to take more, and other mills are also overrun with work in that line, owing to the large acreage of new vines that will come into bearing this year.

GRAIN YIELD.—Traver, Sept. 4: One of the heaviest crops of wheat raised about Traver this year was that put in by Joseph House on a quarter-section of A. P. Davis' land, a few miles northeast of Traver. There was less than a quarter-section — about 150 acres — and it yielded 1934 sacks, or nearly 13 sacks to the acre. All the warehouses in the 76 country are full of grain, and at most of them there is a great deal more grain stacked up outside—on the platforms and along the track—than there is inside; besides which there is a large quantity lying in the fields where it was harvested. This is due to scarcity of cars, the railroad company not having near enough cars to transport the grain to tidewater.

Yolo.

FIRST SHIPMENTS.—Woodland *Democrat*, Sept. 4: The first carload of dried grapes of the season left Cashmere, in the Capay valley, Wednesday. The shipments of this article this year will far exceed those of any previous year. The Southern Pacific Co. also took East the same day, from Santa Rosa, the first carload of French prunes shipped this season.

YOLO COTTON.—Winters *Express*, Sept. 6: Maudred Chapman has sent us in a boll of cotton raised by him on his father's place northwest of Winters. Judges say it is of good staple, and Mr. Chapman says it grows well and yields abundantly.

ARIZONA.

FRUIT CULTIVATION.—Yuma *Times*, Sept. 3: The fruit-growing interests of the valleys bordering upon the Gila and Colorado rivers will prove of paramount importance to the entire county within a comparatively short space of time. No portion of the country from the Atlantic to the Pacific, or from British America to the Gulf of Mexico, can vie with our section in the earliness of the fruits produced in this locality, nor can they surpass the local products in beauty, size, lusciousness and shipping qualities. Counting upon these advantages alone, without bringing into discussion the numerous remaining resources ready at hand, our future is promising almost beyond conception.

SPEED OF FISHES.—**The dolphin and bonito are thought to be the fastest fishes, and although their speed is not known, those who claim to have made close observations say they are fully capable of 20 miles an hour. The writer has seen a school of four or five dolphins sport back and forth in the foaming water in front of a ship's prow, which must have been moving through the water at least 12 miles an hour, almost as if the ship was still. Of course the dolphins must have made a turn at every boat, and the boats were not less than 20 or 30 feet in length. A fish that could do that must have had the power of moving much more rapidly than 20 miles an hour in a direct line.**

The Whole Country Needs Fertilization

PUBLIC ATTENTION

Is called to the following letter from Professor Palmer to R. B. Cunningham, Agent of the Mexican Phosphate and Sulphur Co. at Guaymas. Mr. Palmer has been connected with the Smithsonian Institute for over 30 years:

GUAYMAS SONORA, MEXICO, January 9, 1890.

R. B. CUNNINGHAM, ESQ.—DEAR SIR: In answer to your communication regarding localities likely to furnish a market for Guano, I would state that in my opinion the whole of Southern California will furnish a market for your Fertilizer.

The Vineyards are troubled with a disease in the sap of the plant (or circulation). The cause of this disease has not been found out, but it is a fact, witnessed in animals and vegetables, that most diseases manifest themselves more readily when the animal or plant has not the proper food.

It is my opinion that by applying a liberal quantity of Guano to the Vineyards the disease will be suppressed. The remedy must be administered through the means of the soil, the disease being in the interior of the plant which is controlled entirely by what is derived from the soil.

If the said disease was on the outside of the leaves, stems, or roots, then the remedy would be external only. Experiments with Chemicals have failed, so far as I am aware of, to exterminate the disease.

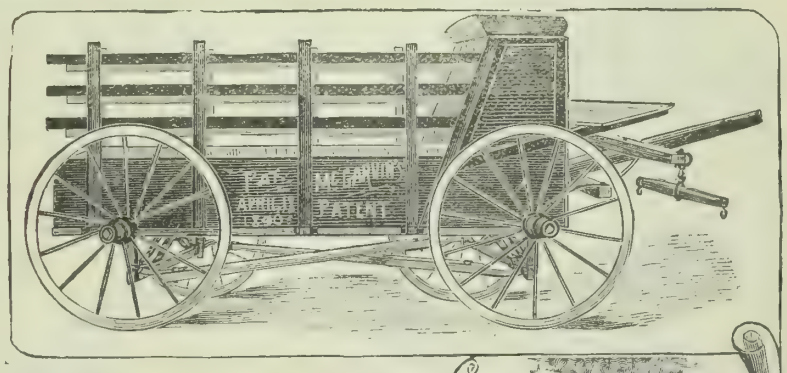
Why not try a Fertilizer as a remedy? It will strengthen the living plants to withstand disease, and may be relied upon as a cure in the diseased plants, the remedy for which must be one that will change the constituents of the plant fluid which impart healthy life.

Southern California also requires a Fertilizer for her Orange Groves and Fruit Orchards. The Public Press and the Fruit Growers assert this fact that they must resort to Fertilization at once. This was proven to my mind on visiting Southern California last year. Trees, like grain, as the crops are gathered, remove from the soil its strength, and in order to continue the ability to produce a healthy and abundant crop, you must convey to the soil a competent supply of Fertilizer, and that section has no means of producing the desired supply from its domestic animals. Yours respectfully, [Signed] EDWARD PALMER.

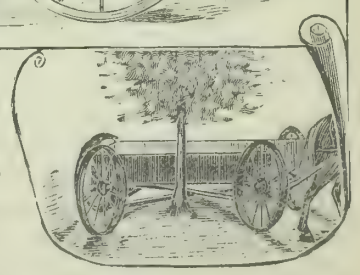
THE MEXICAN PHOSPHATE SULPHUR CO.

Manufacture three grades of this Superior Fertilizer of the following analyses:

GUARANTEED ANALYSIS.	Brand (A) for Sugar Cane, Suga Beets, Etc	Brand (B) for Grain, Gardens, Lawns, etc.	Brand (C) for Fruits, Vineyards, Etc.
Phosphoric Acid	10 to 11 per cent.	15 per cent.	12 per cent.
Potash	9 to 10 "	2 "	5 to 6 "
Ammonia	3 to 4 "	2 "	3 to 4 "



And will sell in lots to suit.



PARTICULARS AND CIRCULARS MAY BE HAD OF THE UNDERSIGNED.

McGarvin's Patent Fruit Truck.

PATENTED APRIL 18, 1890.

The Most Useful Fruit Truck in the World.

First—The Patent Combination of the Gearing allows the Truck to make the shortest possible turn around the trees while loading fruit.
Second—It is low and easy to load.
Third—It has four springs the entire length of the axle, making it as comfortable to ride in as a spring wagon.
Fourth—It is the Cheapest Wagon on the Coast.

Prices Range from $60 to $125.

☞ The $60 Truck has the Patent Combination Gearing, but no springs.

SMITH McGARVIN, Patentee,
Corner Montgomery and Alameda Streets, SAN JOSE, CAL.

The "NEW BECKER."

At Last to "Perfection." Improved, 1885. Re-improved, June 14, 1887.

Approaches nearer to the old method of hand-rubbing than any invention yet introduced to the public. EASILY worked, and washes PERFECTLY clean. It only needs to be seen and tried to be appreciated. In localities where as yet I have NO Agent, I will ship sample machine on 60 days' trial, the party to pay for them at WHOLESALE prices and act as Agent, if found satisfactory; IF NOT, return them. WRITE AT ONCE for new illustrated and descriptive pamphlet, which contains my liberal proposition.

Oregon State Fair,

1890.

Thirtieth Annual Exhibition

Under the management of the Oregon State Board of Agriculture, will be held on the State Fair grounds near Salem, commencing on

MONDAY, SEPTEMBER 15, 1890,

And Lasting One Week.

OVER $15,000.00

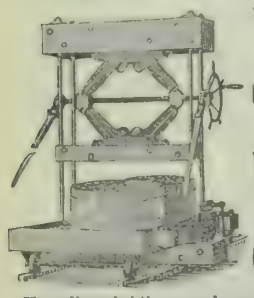
CASH PREMIUMS

Offered for Agricultural, Stock and Mechanical Exhibits, for Works of Art and Fancy Work, and for Trials of Speed.

Reduced rates for fare and freight on all transportation lines to and from the fair. Important improvements have been made upon the grounds and increased facilities are offered exhibitors.

The Pavilion will be open four nights during the week.

A splendid field of horses entered in the speed department, and fine exhibitions of racing will be given each day.



Entries for premiums close Monday at 7:30 P. M. Exhibitors are urged to make as many of their entries on Saturday before the fair as possible. Goods, animals and articles for exhibition must be in their places by 10 P. M. on Monday.

OLIVE PRESS

Have discarded the second pressing, as I only got one-half gallon of wine. Every person who has seen the press working is satisfied that it is the best wine press for work, strength and durability.—WALTER PHILLIPS, Bennett Valley.

The wine press has given entire satisfaction.—E. E. MEYER, Wright's P. O., Santa Clara county.

We think your press is one of the most powerful presses ever made, and very simple to operate. A boy of ten years can run the press and do better work than a man on any other press we have ever seen.—J. & F. MULLER, Windsor, Cal.

Can press two tanks—2000 gallons capacity each—a day, and have plenty of time before 5:30 o'clock to clean everything, with one of your small size wine presses.—R. C. STILLER, Gubserville, Cal.

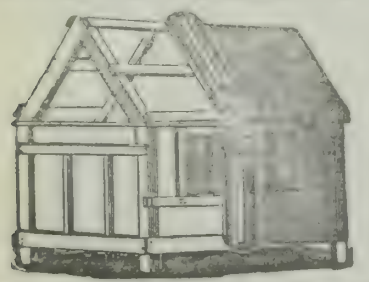
Every wine maker should have one, especially when he does not distill his pomace.—VACHE FRERES, Old San Bernardino, Cal.

The working of your press has been fully up to your representations.—J. F. CRANK, Sierra Madra Vintage Co., San Gabriel, Los Angeles county.

The wine press worked quite satisfactory.—JAMES FINLAYSON, Healdsburg, Cal.

The wine press bought of you gave entire satisfaction. WM. HILL, Petaluma, Cal.

We take great pleasure in attesting the true merits of your wine press. The one in our winery gives the utmost satisfaction. We cheerfully recommend it as good as the best.—DOWNEY FRUIT AND WINE CO., Downey, Los Angeles county, Cal.



Can cheerfully recommend your press as being the most powerful and durable press I have ever seen, and can warrant its giving satisfaction.—WILLIAM PALMTAG, Hollister.

The small wine press bought of you gave entire satisfaction. Would recommend it for small cellars of 25,000 to 35,000 gallons capacity. A. BURNHAM & SONS, Bennett Valley, Santa Rosa P. O.

Plums and Prunes.

At the meeting of the State Horticultural Society held Aug. 29 h at the State Board of Trade, Dr. Gustav Eisen was called to the chair in the absence of the regular officers. The attendance was large.

The secretary read the following letter:

SAN JOSE, Aug. 4, 1890.

Mr. E. J. Wickson, Sec'y Board of Directors State Horticultural Society: The Doyle Fruit-Growers' Association request me to inform you of their organization, and say that they will be pleased to co-operate with the State Horticultural Society in all practical ways toward obtaining and disseminating information that may be of benefit to fruit-growers. I inclose a copy of our Constitution.

E. T. PETTIT,
Sec'y Doyle Fruit-Growers' Association.

The secretary stated that this communication was gratifying in that it expressed a desire for affiliation between the State Society and the various local societies, and that such affiliation might prove of great benefit if it could be made general.

The discussion on fruit-drying was opened by Leonard Coates of Napa. He spoke of the varieties of the prune now claiming public notice. He believed there were two main divisions of prune varieties, one of which is now being grown in this State under the name "Robe de Sargent," the other as the common "French prune." Mr. Rock and he introduced a prune from France about the same time, under the name Robe de Sargent. He obtained Mr. Rock's variety, and when it fruited it proved the same as that he had himself imported. He finds the plum called Robe de Sargent larger and rounder than the common French prune, or Prune d'Agen; the wood is larger, more sturdy and more pithy than the French prune; the leaves are longer and more glabrous or shiny. Even in nursery rows the Robes can be distinguished by their characteristic foliage. The Robe does not unite well with the peach, while the French prune does. It bears as heavily as the French and is perhaps more juicy; it is blacker and more shiny than the French when dried, and makes a larger prune. Robes ungraded averaged 40 to the pound; French, 80 to the pound—all conditions being identical. It has more acidity than the French. The question arises: Can the Robe be grown to make a prune to go in the trade as a French prune as a larger grade? If so, it may prove very valuable.

Dr. E. Kimball of Haywards said he had dried the Robe and the French in the same way and shipped them to the same Eastern house, marking the Robes "large French prunes." They sold for 3½ cents per pound more than the French. Dr. Kimball said he had procured the Robe de Sargent from three sources, and when the trees fruited they were found to be identical. They also agree in growth and other characteristics.

James Shinn of Niles called to mind the decision of W. B. West, after studying the French prune in France, that the variety grown here as the Petite d'Agen was the prune of France. He apprehended that the Robe might be too tart for common taste.

Mr. West of Stockton stated that his observation in France was stated by Mr. Shinn, but the orchards are small and widely scattered and he could not see all. He had no doubt there were sub-varieties of the same prune in France grown from the seed, etc.

I. A. Wilcox of Santa Clara expressed a preference for the Robe de Sargent over the common French.

L. F. Moulton of Colusa said he had given considerable time to hunting up varieties called Robe de Sargent and Petite prune, and he had concluded there were but two varieties—all the Robes were the same and all the Prunes d'Agen were the same practically, at least so far as grown to any extent in this State.

The secretary exhibited dried and fresh prunes sent by J. L. Mosher of San Jose. One variety seemed to show marked divergence from the common French prune grown in the same orchard. Mr. Lelong said he had seen the tree and believed the variety to be distinct.

As there were other samples shown by different speakers, there was, upon motion, a committee appointed to report upon the subject of prune varieties at the next meeting, viz.: Messrs. Leonard Coates, Edwin Kimball, B. M. Lelong, J. L. Mosher.

Other Prunes and Plums.

Judge Blackwood finds that the Bulgarian and Fellenberg prunes do not sell as well as the French.

L. F. Moulton of Colusa considered the Bulgarian as a good prune to let alone.

C. W. Hatheway of San Lorenzo said the same buyer paid him one cent per pound more for Bulgarian than for French.

Mr. Coates said he supposed that the Bulgarian was better than the French for Alameda county, but that does not apply to all localities.

Dr. Kimball said the difficulty with the Bulgarian may arise in part at least from the bearing habit of the tree. It bears on new wood, and not on old spurs all through the tree like the Robe and the French prunes, consequently, if pruned closely, there will be little fruit. Also, if the Bulgarian does not get thoroughly ripe, it will not make a good prune, but will puff up. All French and Robes make prunes, and will ship well even if picked quite green.

Dr. Kimball showed fine samples of amber-colored prunes he made from the Jefferson plum. It has a fine color and a better flavor when cooked than the Silver prune. He dips the Jefferson just as he does French prunes and sulphurs one-half hour.

Judge Blackwood said his Jeffersons treated in that way sold readily as "Silver prunes."

Dr. Kimball exhibited a handsome plum sport which originated in his orchard, and which he calls "Red Coe's Golden Drop." He had a tree of Imperial gage worked on peach; into the Imperial gage he worked the Hungarian prune, and as that did not pay well he worked it over again by putting Coe's Golden on the Hungarian prune. One branch in the top of the tree began to bear plums like the Coe's Golden but of red color, while the rest of the tree was true Coe's Golden. This branch has maintained this habit, and buds from it have also borne the same variety.

Mr. Coates showed specimens and spoke favorably for the Satsuma Japan plum as a shipping plum. It is of very firm flesh and pleasant flavor. The secretary also showed Satsuma plums sent him by the introducer, Luther Burbank of Santa Rosa, which had lain two weeks on his desk and were still very firm. He showed also the Burbank plum, which was showing very good keeping properties.

Mr. Coates spoke of the disappointment over the Kelsey in that it does not do well in the hot interior valleys, though it is an admirable plum in the bay climate.

Mr. Shinn said the Kelsey ripens too late. It arrives at the East so as to compete with peaches, which is not to its advantage.

Mr. Lelong alluded to the success being attained with *Prunus Simoni*. Samples shipped East June 23 i to Chicago were held two weeks and then sent on to Liverpool, arriving in good order.

Mr. Coates said the Simoni was selling well at the East. A Winters grower obtained $2 45 for 17 plums. The Simoni ripens with Royal Native, which is too sour. The Clyman, a California seedling, introduced by Mr. Coates, has exceeded all expectations as an early market plum and in bearing property, etc.

Fig Culture.

G. P. Rixford announced that one of the Bulletin figs which has hitherto dropped its fruit had matured samples this year on Mr. Shinn's place at Niles. Mr. Shinn stated that a few ripe figs had been secured, but he could not attempt a description of them.

Orchard Cultivation.

One subject for discussion at the September meeting will be the following points on orchard cultivation submitted by A. L. Bancroft. By early publication members can collect their thoughts and experiences and contribute them to the discussion:

Shall the plow, harrow, clod-masher, chisel-tooth cultivator and the diamond-tooth cultivator be abolished from the orchard and some form of disc harrow, subsoil cultivator, and straight-bar weed-cutter substituted?

The plow turns up lumps; it requires the harrow and clod-masher to pulverize them; the disc harrow does not.

The plow brings up the soil from below and exposes it to the action of the sun and air; the disc harrow does not.

How much of an advantage is it to the soil to have this done, especially if it is turned over at the commencement of the season, and a few weeks later a second plowing turns it back again?

When the plow is used there are times and seasons when the weeds get such a start that they are very troublesome. Last season, for instance, the mustard grew ten feet high in places before it could be turned under. The disc harrow could be used when the plow could not be used; the top soil stirred to a depth of two or three inches, and the growth of weeds prevented. How much advantage is it to the soil to have the weeds grow and be turned under?

The subsoil cultivator works easier, goes deeper and keeps the soil in as good or even better condition of tilth and keeps the moisture up as well or better than the implements now generally used. Consequently it does the work cheaper.

The straight-bar weed-cutter is a good tool for morning-glory and late weeds regardless of what other tools are used.

At the September meeting, the subject of fig-growing will also be discussed, with the opening by Dr. Eisen.

The State Fair.

As we go to press, advices are that the State Fair at Sacramento is developing well. The opening was naturally somewhat interfered with by the great celebration in this city, but now the interest has turned strongly toward the Capital city. Next week the fair will be at its best estate from Monday until Saturday night, and it should receive the fullest attention and patronage.

NURSERY STOCK.—F. S. Phoenix of Bloomington, Ill., the well-known nurseryman, has issued his semi-annual trade price-list for the fall of 1890. It includes fruit, nut and shade trees, grapes and berries, ornamental shrubs, hardy climbers, etc.

Notes on the Fairs.

(*Concluded from page 233*)

flowers. J. V. N. Young was there with 24 plates of named apples, 4 varieties of pears, 16 of peaches, 2 of figs, 3 of prunes, with nectarines, strawberries, blackberries, musk and watermelons, 8 varieties of potatoes, 3 of sweet potatoes, 3 of onions, 4 of cabbages, mammoth table beets, carrots, squashes, green corn, cucumbers, beans, sassafras, peppers.

E. Leedhams' "A 1" exhibit, besides a general line of fruits and vegetables, included 67 splendid bouquets of 30 varieties of flowers.

J. S. Brooks placed on his table over 100 varieties of cut flowers, 20 varieties of beans, and many kinds of vegetables grown on a two-acre farm.

W. H. Findley had an excellent display of evaporated fruits, consisting of peaches, pears, prunes, apricots and apples; and notable exhibits were made by Andrew York, E. M. Carr, D. F. Newson, Jas. Gregory, P. H Dallidet and others too numerous to mention.

San Luis Obispo—16th District.

In a note from San Luis Obispo, 5th inst., Hon. J. V. Webster remarks: "The fair is well attended and fairly successful; agricultural and horticultural exhibits large;" and from extended reports in the *Tribune* we glean as follows:

The stock display is excellent so far as it goes, but as usual it remains to be complained that the county at large is slimly represented. A. Bieren has a herd of remarkably fine cattle, and so has E. W. Steele. The stalls at the track were all full, and the races, the first two days, appear to have proved very entertaining to the spectators.

At the pavilion, Mr. Cruickshank, foreman of the State Experimental Station near Paso Robles, had a variety of sheaf grains and grasses and samples of cleaned grains.

J. V. Webster of Creston made a very fine display, embracing oats, both wild and tame, wheat and barley in sheaf, evergreen millet, alfalfa and sugar-cane; pears in variety, wine and table grapes and wine; potatoes, musk and watermelons, squashes and other garden truck; Silver, Petite and other prunes, apples, peaches, etc.

N. W. Palmer of Huasna represented the apiarian interest with a dozen jars of strained honey.

Auburn—20th District.

The second annual fair of the 20th Agricultural District opened on the 2 i inst. at Auburn. The new pavilion, says the *Argus*, was supposed to be ample, but the first day of the fair found the space both on the main floor and galleries pretty much all taken. The fruit exhibits of Geo. D Kellogg and C. T. Adams of Newcastle, Capt. E. L. Hawk of Rocklin; the display of flowers, plants, nursery stock and fruits of A. F. Boardman, and the fine fruit exhibit (infinite in variety) of Mrs. Emily Roberson of Olivina ranch, were among the prominent features of the main floor.

O. D. Storrs had a table laden with choice melons, and with squashes that would weigh anywhere from 50 pounds up to 150. Mrs. Van Lennep, Joseph Bartcher and E. B. Beecher also had excellent fruit exhibits. G W. Threlkel showed a peach weighing 17½ ounces, and had others to match.

A. Keller's geological collection was without competition in that line.

The gallery was given over entirely to fine arts and fancy-work.

Gen. Jo. Hamilton, president of the association, delivered the opening address. He urged the young people to cultivate the purely domestic virtues, and was proud of the fact that he had daughters who were able to hitch up the team if need be and drive him out. The General's address was peculiarly felicitous, and was frequently applauded. The attendance was large and enthusiastic.

On the second evening Hon. Geo. G. Blanchard of Placerville made a carefully prepared and able speech.

Thursday night a large concourse greeted E. W. Maslin, whose annual address was a masterpiece.

The exhibit of fine stock at the park was considerably larger than last year's, embracing horses, cattle and poultry.

The contest of draft horses was decided in favor of C. A. Johnson. In the walking match for stallions the first money was won by Wm. McIntosh's horse, time 5:58; second money by B. Burr's horse, California Prince, time 6:36 The prize for fast walking team was won by Hoffman Bros.' Dan and Prince, time 5:55.

The best exhibit of skill by young men in harnessing a span of horses was made by John Viehmeier of Ophir, the only other contestant being Howard Stone of Auburn. Stone began by harnessing Hoffman Bros.' team, driving around the track and unhitching and unharnessing them. The time occupied in harnessing and hitching, unhitching and unharnessing, was 6:07. The time occupied by Viehmeier with Johnson's team in doing the same thing was 4:59.

The girls' contest in harnessing and hitching up, and unharnessing from a single buggy, presented four applicants. Katie Deetkin was the first, and it took her 2:17 to harness and hitch, and 1:18 to unhitch and unharness; total time, 3:35. Cora Johnson did the first act in 3:15 and the last in 1:11; total time, 4:26.

DR. T. J. FRAZER, Dentist, Room 54, Flood Building, Market and Fourth Streets, San Francisco, Cal.

Choice Oregon Products.

An Extensive Breeder

Mr. G. W. Dimmick, Hubbard, Oregon, reports his numerous herds in fine condition, and about 50 additions have been made this season. "Jewel's Kirklevington" 56541 stands at the head of a fine herd of some 70 Shorthorns, and many good individual cows representing such families as Bellechini, Bourbon Bells, and Lady Helens go to make up a herd of unusual merit. In Aberdeen-Angus, "Gen Weaver," 6818, bred by Maj. Bruce, stands at the head, and some 20 old and young comprise the herd of this popular breed. Mr. Dimmick also breeds the best families of Jerseys.

Fine Poultry.

Those who are interested in pure-bred poultry should note the announcement made by Mr. George O. Sloan, proprietor of the "Square Poultry Yards," Forest Grove, Oregon. A representative of the PRESS recently inspected these yards and reports some fine specimens of the numerous breeds. Mr. Sloan has been very successful with his Indian Games this season, and can show visitors some as fine birds as will be found in any show ring, East or West, this fall. In Houdans, Silver-Spangled Hamburgs, White Leghorns, Brown Leghorns and Plymouth Rocks, there are birds that would suit the fancy of any one. Mr. Sloan assures us that he intends keeping none but the finest stock.

Berkshire Swine.

Mr. T. H. Tongue, Hillsboro, Oregon, has a herd of English Berkshires of unusual merit. Capt. Rider, 2969, heads the herd. Maggie Rider, 8184, tracing to Duke of Gloucester on the sire side, and Lillie II on dam, is one of the representative sows that comprise the herd. Black Duke II, 23849, bred by N. H Gentry, has proven a very valuable breeder, and Mr. Tongue reports a good crop of pigs from his services. Those wanting something choice should correspond with Mr. Tongue.

Shorthorn Cattle

Messrs. McEldowney & Hawthorn of Hillsboro, Oregon, breeders of Shorthorn cattle, report their herd in good condition. Some 50 animals comprise the herd. Glendower, 93537, heads the herd. He is an excellent individual, good color, and he is stamping his good qualities upon his progeny. Such families as Bloomfield, Roses, Jubilees, Venumns and Peri-Constances are represented on the female side.

Nursery Trees.

Messrs. Wirt Bros., proprietors of the Oregon Nursery Co., Salem, Oregon, have a very fine growth of nursery stock to offer their patrons this season. Their stock is all in fine condition, perfectly free from insects or blight. The large variety of apples includes such varieties as Ben Davis, Northern Spy, Yellow Newtown, Gravenstein, Duchess of Oldenburg and others. In pears and peaches, there is an unusually fine growth. Prunes, both Italian and French varieties, are in abundance, as well as all kinds of small fruits.

Forest Grove Poultry Yards.

We wish to call special attention to the advertisement in this issue of the Forest Grove (Oregon) Poultry Yards, of which Mr. J. M. Garrison is proprietor. A representative of this paper, who called at these yards, assures us that Mr. G. has one of the finest establishments of its kind on the Pacific Coast. His stock, comprising the leading varieties, contains many specimens possessing a very high degree of merit.

Steam Plowing.

PUBLISHERS RURAL PRESS:—In an article in your issue of Aug. 23d (which, of course, was an advertisement like mine of the week before), Price, by the use of the "we," endeavors to make it appear that you say editorially:

"We know nothing of the merits of the controversy between these two gentlemen, but it would seem that Mr. Remington could hardly expect Mr. Price to advertise a competitor."

Now, I in no way recognized Price as a competitor. What I did do was to accuse him of barefacedly and designedly, with a view to concealment and a suppression of the truth, ascribing to his machine all the things done by my engine. This he did when his machine had done nothing at all—when it was still standing in the shop at Racine, Wisconsin where it was made. My whole article was simply an arraignment of Price as a trickster—an appropriator of things to himself and his machine which did not belong to them, and I hope you will give me the small space required in your paper to tell the public so.

D. L. REMINGTON.

Woodburn, Or., Aug 28th.

The Stockton Fair.

Readers should bear in mind the date of the San Joaquin Valley District Fair at Stockton on Sept. 23 i to October 4 h. This notable fair always follows the State Fair and is looked upon as one of the best of the circuit. With its recent improvements at track and pavilion and the liberality and enterprise of its management in securing attractive features, it is little wonder that it attracts large concourses and achieves popularity. Exhibitors usually enjoy facilities for displaying their products second only to the State Fair, and this should induce them to apply for space to Secretary La Rue as early as convenient.

DESCRIPTIONS OF NEVADA COUNTY.—We have read with pleasure several articles descriptive of Nevada county and incidentally of the Central Sierra region by Prof. Granville F. Foster of Sunol, Alameda county. The articles appeared in the Leeds (Eng.) *Mercury*, and must do much to extend the fame of California. We hope to find room for some of the excellent paragraphs in future issues of the RURAL.

Breeders' Directory.

Six lines or less in this Directory at 50c per line per month.

HORSES AND CATTLE.

JERSEYS.—The Best Herd, all A. J. C. Registered, is owned by Henry Pierce, San Francisco.

J. H. WHITE, Lakeville, Sonoma Co., Cal., breeder of Registered Holstein Cattle.

M. D. HOPKINS, Petaluma, importer and dealer in Eastern registered Shorthorns, Red Polled Cattle, Holsteins, Devons and Shropshire Sheep.

GEO. B. POLHEMUS, Coyote, Cal. Holstein-Friesian cattle, comprising males and females on advanced register. First premium in great milking test at State Fair, 1889, was won by a member of this herd.

PETER SAXE & SON, Lick House, San Francisco, Cal Importers and Breeders, for past 18 years, of every variety of Cattle, Horses, Sheep and Hogs.

HENRY HAMILTON, Westley, Cal., breeder of Kentucky Jacks and Jennies, Draft Horses and Holstein Cattle. Jacks, Horses and Mules for sale.

S. F. Market Report

Market Review.

DOMESTIC PRODUCE, ETC.

SAN FRANCISCO, Sept. 10, 1890.

This has been a broken week; we might with safety say that no day has been free from the excitement attending the Admission Day celebration, which has necessarily interfered with trading. At the close business does not show any material change, for the effects of the holidays are still apparent. The Eastern and English wheat markets have shaded off, probably falling in sympathy with silver. The following is to-day's cablegram:

LIVERPOOL, Sept. 10.—Wheat—Inactive. California spot lots, 7s 2d to 7s 4½d; cargoes off coast 37s 6d; just shipped, 37s 6d; nearly due, 37s 6d, cargoes off coast, slow; on passage, inactive; Mark Lane wheat, slow.

Liverpool Wheat Market.

The following are the closing prices paid for wheat options per ctl. for the past week:

	Sept.	Oct.	Nov.	Dec.	Jan.
Thursday	7s6d	7s6½d	7s7d	7s7½d	7s7d
Friday	7s4½d	7s5½d	7s5½d	7s5½d	7s5½d
Saturday	7s4½d	7s5½d	7s6½d	7s6½d	7s6½d
Monday	7s4½d	7s5½d	7s6½d	7s6½d	7s6½d
Tuesday	7s4½d	7s5½d	7s6½d	7s6½d	7s6½d

The following are the prices for California cargoes for off coast, nearly due and prompt shipments for the past week:

	O. C.	P. S.	N. D.	Market.
Thursday	38 9d	38 6d	38s6d	Quiet.
Friday	38 9d	38s6d	38s6d	Quiet.
Saturday	38s9d	38s6d	38s6d	Quiet.
Monday	38s	38s	38s	Easy.
Tuesday	38s6d	37s6d	37s6d	Easy.

Eastern Grain Markets.

The following shows the closing prices of wheat in New York for the past week:

Day.	Sept.	Oct.	Nov.	Dec	May.	June
Thursday	101¼	102½		105¾	109½	..
Friday	101¼	102½	103½	104¼	109¾	..
Saturday	101¼	102½		105½	109¾	..
Monday	100½	101½	102½	103½	108¾	..
Tuesday	100⅝	101¼		103⅝	108¾	..

The closing prices for wheat have been as follows at Chicago for the past week:

Day.	Sept	Dec	May.	June
Thursday	..	102¾	106⅝	..
Friday	..	102¾	106⅝	....
Saturday	100⅛	102¼	106¼	....
Monday	..	101	105	....
Tuesday	..	100⅝	104⅝	....

NEW YORK, Sept. 10.—Wheat—$1.02⅜ for cash, $1.01¼ for October, $1.05⅛ for December and $1.09½ for May.

CHICAGO, Sept. 10.—Wheat—$1.01⅛ for December and $1.05½ for May.

Foreign Grain Review.

LONDON, Sept. 8.—The *Mark Lane Express*, in its review of the British grain trade during the past week, says: The weather has been finer and warmer in Western Europe, and the farmers, being engaged in completing the harvest, neglected the market. New English wheat, fairly fixed, 32@36s for Red and 35@40s for White. Foreign wheat fell off 1s and flour 6d. The European wheat yield is from 154,000,000 to 162,000,000 quarters, making necessary importation from 11,000,000 to 20,000,000. Spring corn is firm and oats steady. Yellow maize is quoted at over 20s; Flat is held at 23s. At to-day's market new English wheat was 1s lower. Wheat was quieter.

Eastern Wool Markets.

BOSTON, Sept. 5.—Wool is in good demand, but the market is somewhat easier. Territory sales amounted to over 1,000,000 lbs., including fine at 58@60c; fine medium, 55@58c, and medium at 52@55c. Texas, California and Oregon wools are steady.

NEW YORK, Sept. 5.—*Bradstreet's* says: Wool is quieter at Boston. The demand for foreign wools, which has been throughout the summer more active than the domestic product, has fallen off considerably; the only classes which are meeting with even fair sales are the fine Territory wools. Ohio and Michigan wools are in poor positions. There are indications of carpet wools tending upward. Texas and all low-grade wools are very dull, and sales have been very few and of small amounts. There have been calls for odd lots of several grades, and these have really been the only transactions brokers have been making.

NEW YORK, Sept. 6.—The trade and sentiment in wool are more encouraging than for many weeks. Manufacturers generally need stock after the prolonged light buying. The aspect of woolens promises to stimulate attendance. The approaching tariff adjustment gives buoyant effect, but more to the point is the wholesome commercial character which prevails in all Eastern dealings. Ten thousand lbs. spring California, 4000 lbs. scoured, 27c; 270,000 lbs. do, 17@23c; 58,000 lbs. scoured Texas, 43@52½c; 25,000 lbs. medium unwashed fleece, 27c; 10,000 lbs. XX and above, 33½c; 17,000 lbs. domestic and 547,000 lbs. foreign at private terms. Boston reports an improved tone in the demand. Sales—298,000 lbs. foreign and 2,239,500 lbs. domestic, including 50,000 lbs. Humboldt county spring, 24c; 50 000 lbs. Southern free, 20c. Though there is a light trade at Philadelphia, fine clothing grades received more inquiry. All prices are named with confidence.

Hops.

NEW YORK, Sept. 8.—In the hop market things have almost come to a standstill for lack of supply. Brewers paid 31@33c for good to prime 1889, and riffraff stuff that was unsalable 60 days ago has been worked off at remarkably full prices in small lots. It was reported that three or four interior dealers have purchased a total of about 1000 bales of the new crop in Waterville, N. Y., at 50c per pound during the last few days, and the latest advices were that the chances were very poor for securing desirable growths in any section at a less price. Brewers are still placing orders for the new crop States and Pacifics at full prices. Speculators are doing practically nothing, in short, the market is now stronger on the home situation alone than it has been at any previous time this season. Cable advices reflected no material change in the situation in Europe. California, crop of 1889, 30c; Washington, crop of 1888, 15c.

Miscellaneous.

NEW YORK, Sept. 6.—The unfortunate suspicion of glucose excites doubt in samples of California white honey. The coast's reputation for purity of products should not be tampered with.

Spot and prospective hops hold a boom. All '89's bring 25@30c; olds, 8@15c, largely absorbed; new fancy sell in a small way, 50@55c. The crop is estimated at 50,000 to 60,000 lbs.; the exports, 1700.

French prunes advanced to 2¼c, four sizes; Pacifics, 12½c. There is a loss of confidence in the latter.

Canned fruits are placed on arrival. Standard peaches, $2.65@2.70; apricots, $2.10@2 26; pecans, $2 50@2 60; plums, $2@2.10.

Dried apricots dull; last prices unheeded. Peaches, sacks, 23½c; small inquiry.

Local Markets.

	l.	....	....	....	....	....
Tuesday	h.	....	....	....	....	....
	l.	....	....	....	....	....

BAGS—The market is dull, with buyers able to secure hand-sewed standard-size grain bags at 7⅜c to 7⅝c, although the pool asks 8c.

BARLEY—The market has not only held strong but holders were able to establish another advance. Receipts have been quite free, but under an active consumptive demand, stocks have not accumulated. The exports by sea are very light, considerably less than for the like time in 1889. The following are to-day's Call Board sales:

Morning Session: Buyer 1890 — 100 tons, $1.38½; 1100, $1.38¾. Buyer season—400 tons, $1.44; 500, $1.44¼. May—100 tons, $1.39 ₩ ctl. Afternoon Session: Buyer 1890—100 tons, $1.39½. Buyer season—100 tons, $1.44½; 100, $1.44⅝; 100, $1.44¾; 200, $1.45; 100, $1.45¼ ₩ ctl,

BUTTER—The market has made another upward move. At the close there is yet a strong tone, but some dealers are rather suspicious of the situation, believing that higher prices will send in larger supplies. Pickled is coming in quite freely. Holders ask an advance for gilt-edge. It is claimed that the supply of creamery from the Western States will be light, which, if proven correct, ought to favorably influence our market.

CHEESE—The market is steady, with a good demand ruling.

EGGS—The market has ruled strong at a slight advance. It is claimed by dealers that the local consumption will lessen after this week, and as prices are well up, receipts will increase, when prices will quite likely shade off.

FLOUR—The market is firm under a good steady demand.

WHEAT—Buyers have been bidding down, but holders' firmness has prevented business. There is no doubt but the decline in silver has very much to do with the fall in the price of wheat. The present silver law does not work satisfactorily, for speculators can work prices up and down greatly to the prejudice of farm products. Large farmers are more than ever in favor of the free coinage of silver so as to take it out of speculators' hands. In futures, trading has been light. The following are to-day's Call Board sales:

Morning Session: Buyer 1890—1200 tons, $1.40¾; 400, $1.40¾; 300, $1.40⅝. Buyer season—500 tons, $1.48½ ₩ ctl. Afternoon Session: Buyer 1890—100 tons, $1.40¾; 300, $1.40⅜; 200, $1.41. Buyer season—100 tons, $1.48½; 200, $1.48⅝; 100, $1.48¾; 200, $1.49 ₩ ctl.

[COMMUNICATED.]

Cereals.

The wheat market abroad has sunk to still lower figures. The decline, while largely due to the fall in the price of silver, has also been aided by European farmers freely marketing their grain. At the East, as on this coast, farmers sold quite freely, but at the close the lower prices restrict sales, and as silver shows a stronger tone wheat may soon begin to strengthen. In this State it is quite likely that with free arrivals of ships charters will set off, which ought, without any other influence, favorably effect wheat later on. Harvesting is about over and very soon the selling pressure will be over, for when grain is warehoused there is always stronger holding.

Barley continues to go largely into consumption. With rains and bad roads the demand, it is claimed, will fall off. The crop this year is very light, and even with lighter feeding it is said that the supply will barely carry us into another season. The Washington crop is larger and better than it was in last year.

Oats have held steady, and this too in the face of fair receipts. The home demand is quite free. It is feared by some that shipments from Oregon will increase, which, if proven correct, will cause prices to shade off.

Corn has ruled steady at full figures. Receipts are only fair, as is the demand. Advices from the Central States are still confirmatory of a light yield.

Rye is without any particular change to note.

A prominent Liverpool house writes: "While we are of opinion that the English wheat crop is a better one than generally supposed, and that the production of wheat in Europe is probably greater than that of last season (to which must be added Australian and La Plata supplies), which last year failed us, yet there is now no doubt that the American crop of both winter and spring wheat is a partial failure, and the great rise in silver (silver has declined since and so has wheat.—Commercial Editor RURAL PRESS.) adds to the cost of importing Indian wheat. Thus two very large sources of supply (the United States and India) seem likely to ship sparingly, and a strong situation for holders is created. The general exhaustion of old stocks is also a favorable feature and the offerings of Russia, our third great wheat shipper, are remarkably light at present. The Danubian wheats are the most truly forward, that part of the country having apparently reaped a good crop this year."

Feedstuff.

Bran and middlings are strong at an advance. The demand is fair. Feedmeal is steady. Ground barley exhibits more strength.

Hay is strong at another slight advance for the better grades. The crop this year appears to have been short, and as there is a good demand, prices are in sellers' favor. It is claimed that fully one-quarter more has been fed so far this season than for the like time in 1889. This increase is due to more teaming.

Fruits.

The broken week interfered very greatly with general trade. Besides, many interior visitors brought liberal supplies of fruits which were distributed with a generous hand that interfered to some extent with trade.

To-day's business is light, which is offset by light receipts. Strawberries are dull, very light demand. The receipts of blackberries and raspberries are very light, but the receipts of huckleberries show an increase.

Mexican limes, selected, sell at $6. Bananas are firmer, the inside quotations being $2.

Apples are gradually gaining in strength for the better keepers. The export demand is increasing. The supply of other kind of tree fruits is growing lighter. Choice canning peaches are placed quite readily at 5c to 6c, plums, at 2c to 3c, some fancy at a slight advance. Pears, if good for canning, fetch full prices. The trouble is that canning varieties are generally too ripe.

Heavy receipts of grapes caused prices to shade off under a strong selling pressure; some were placed as low as 15c a box, being too ripe to keep. The only exception to the above was canning grapes, which canners took at from $30 to $45 a ton. Wine grapes continue to meet with a good demand.

For dried fruits there is a good distributive demand. Shipments out of the State are assuming larger proportions so as to meet contract sales. It is claimed that supplies from first hands are better cleaned up than ever before so early in the season, and at good prices too. If proper attention has been given to selecting the fruit, drying, packing, etc., California's dried fruit reputation ought to receive another substantial boom. Quotations in sacks are as follows, with fancy fetching a slight advance: Apples, sliced, 8c to 9c; quartered, 7½c to 8c; pitted plums, 10c to 11c per lb; bleached apricots, 14c to 17c per lb; sun-dried bleached, unpeeled, 17c to 20c; White nectarines, 15c to 17c; Red nectarines; 10c to 11c; California prunes, ungraded, 10c to 10½; from 100 to 40, 9c to 12c; grapes, 3¼c to 4c.

Shipments of raisins are beginning quite early. It is claimed that curers are drying, selecting and packing raisins in the most substantial manner. The demand continues quite active at from $1.75 to $2.25 for London layers, with fancy brands going above the latter figure. Loose Muscatels move off at $1.50 to $2. Inferior packs sell proportionately less. Raisins in the sweat sell at 5c to 6½c according to locality and quality. The pack this year will show a decided increase over last year's, provided early rains do not damage large quantities.

Live-stock.

Bullocks and mutton sheep are steady. The demand and selling offers are about evenly balanced. Some dealers look for better prices soon for the former. Hogs are steady with a firm tone. Fresh milch cows, with an advance in butter, are being inquired for. Horses are slow for medium work animals. Driving, matched teams and general utility horses are in fair request.

The market for dressed cattle is quoted as follows [to obtain the price on foot, take off from the price for stall-fed one-third to one-half, according to the nature of the feed and time fed; and for grass-fed take off the price from 40 to 60 per cent]:

HOGS—On foot, light grain fed, 4¼@4½c ₩ lb dressed, 7¼@8½c ₩ lb.; heavy, 3½@4c ₩ lb.; dressed. 5¼@6¼c ₩ lb. Stock hogs, 4¼@4½c ₩ lb

BEEF—Stall fed, 6½@—c ₩ lb.; grass fed, extra, 6@—c ₩ lb.; first quality, 5¼@5¼c ₩ lb.; second quality 4½@5c ₩ lb.; third quality, 4c@— ₩ lb.; bulls and thin cows, 2@3c ₩ lb.

VEAL—Small, 6@8c ₩ lb.; large, 4@6c.

MUTTON—Wethers, 6½@7½c ₩ lb.; ewes, 6@6½c ₩ lb.; lamb, spring, 8@9c.

Vegetables.

Canners are taking all the tomatoes obtainable at 35c a box, which keeps the market strong Green corn is having a steady sale at firm prices. String beans move off at 2c to 3c a pound. Cucumbers, summer squash, egg plant, okra and red peppers are unchanged, as are cabbage, cauliflower and root vegetables. Marrowfat squash are marked to $15 a ton.

Onions are fairly steady at current quotations.

Potatoes are steady. Receipts are free and so is the demand. The more choice, good keepers are wanted. The crop this year is large, being more generally distributed, but the overland shipping demand keeps prices from going very low. Sweet potatoes closed firmer to-day at 1¾@2¼c.

Miscellaneous.

Poultry has moved off at better prices, under a good demand and moderate receipts. As wild ducks are coming in there will be more selling competition soon.

Honey is moving off at unchanged quotations. Receipts the past week show an increase.

Hops are in quicker demand. Buyers freely bid 35c, which means a slight advance on a firm selling offer. The supply in first hands is light.

Wool is without essential change. The fall clip promises to be a full average both in quantity and quality.

New crop beans are coming in more freely. As the crop in the Central States is said to be light, many look for no materially lower prices here.

Exports by sea the past week aggregate as follows: Wheat ctls, Liverpool, 43,370; Cork, 69,775; Central America, 2091. Flour bbls, China, 16,385; Central America, 6065; Panama, 250; Guayquil, 500; Japan, 861. Beeswax lbs, New York, 1115. Brandy gals, New York, 357. Wine gals, New York, 60,281; Central America, 2082; Panama, 2707; Japan, 560; Beans lbs, Central America, 2321; Panama, 2019; China, 22,316. Corn ctls, Central America, 2240. Raisins, boxes, Central America, 70. Hops lbs, Japan, 1336.

From the *Commercial News* of Sept. 8th the following summary of tonnage movement is compiled:

	1890.	1889.
On the way to this port	279,856	232,994
On the way to neighboring ports	21,478	21,136
In port, disengaged	6,159	24,351
In port, engaged for wheat	46,626	68,142
Totals	354,119	346,623

To get the carrying capacity, add 65 per cent to the registered tons as given above.

From July 1, 1890, to Sept. 3, 1890, the following are the exports from this port:

	1890.	1889.
Wheat, ctls	1,933,005	1,975,395
Flour, bbls	192,384	220,060
Barley	54,840	233,324

Domestic Produce.

Extra choice in good packages fetch an advance on top quotations, while very poor grades sell less than the lower quotations.

California Fruits East.

CHICAGO, Sept. 4.—The Earl Fruit Co. sold California fruit to-day as follows: Bartlett pears, ripe, $2.35@2.90; grapes, half-crates, Tokay, $1.80 @2.10, some poor ones, $1.50@1.60; Muscat, poor order, 65c@$1.15; German prunes, $1.80; peaches, Susquehanna, $1.60@1.65; Orange Cling, $1.55@ 1.60; Muir, $1.60; Yellow Cling, $1.25@1.60. Fifteen to 20 carloads have been sold here daily during the past ten weeks. The weather is very hot and muggy.

CHICAGO, Sept. 4.—Porter Bros. sold seven carloads of California fruit to-day as follows: Bartlett pears, ripe, $2.55@3.20; Susquehanna peaches, $1.50@1.75; Gros prunes, $1.95; Muscat grapes, half-crate, 55c@$1, all in poor order; Beurre Clairgeau pears, $2.75; Egg plums, over-ripe, $1.15@ 1.25; Gros prunes, $1.50@1:60; Duchess, $2.70; White Cling peaches, $1.35; Tokay grapes, half-crate, $1.25@1.30.

NEW YORK, Sept. 4.—Sgobel & Day, agents of the California Fruit Union, sold one car of California fruit as follows: Grapes, Tokay, $2.60@ 2.90; Muscat, $1.20@1.40; Malvoise, $1.45@1.90; Damascus, $1.75; Black Prince, $1.15; Rose de Peru, 75c@$1.30. The fruit was in good order. Tokay grapes are in strong demand. Rose de Peru are not wanted in this market.

NEW YORK, Sept. 5.—Sgobel & Day, agents of the California Fruit Union, auctioned three carloads (two ventilated) of Tokay grapes at $2.90 @2.15; Morocco grapes, $3.10@2.75; Malvoise grapes, $1.60@1.35; Rose Peru grapes, $1.20@85c; Muscat grapes, $1.40@90c; Beurre Clairgeau pears, $2.35; pears, $2.35@2.25; Gros prunes, $2.20@1; Fallenberg plums, $2@1.75; Kelsey plums, $5.60 per double crates, Kelsey plums, $4.05 per single crates; Egg plums, $2.55; assorted peaches, $1 95@ 1. Tokay grapes are in strong demand; Rose Peru and Muscat not wanted. Peaches, green, were undesirable in this sale.

CHICAGO, Sept. 5.—Porter Bros. sold seven carloads of California fruit to-day as follows: Bartlett pears, $3@4.05; Tokay grapes, half-crates, mostly in poor order, $1@1.60; Salway peaches, $1.45; Orange Cling, $1.35@1.90; Susquehanna peaches, $1.35@1.65; Japan plums, $1.85; Fallenberg plums, $1.30@2.60; Hungarian prunes, $2@2.10; Muscat grapes, full crates, $2.25@2.30

CHICAGO, Sept. 6.—The Earl Fruit Co. sold California fruits at auction to-day as follows: Beurre Clairgeau, $2.15@2.40, a few ripe, wormy ones selling for less; Beurre d'Anjou pears, $2.45@ 2.55; Louis Bond pears, $2.55; Onondagas, $2.45; Beurre Hardy, half boxes, $1.25; Hungarian prunes, $1.75@1.85; Tokays, half-crates, $1.20@1.75; Muscats, half-crates, poor order, 65@95c; Orange Cling peaches, $1.55; Susquehannas, $1.50; Honey Clings, $1.35. Twenty carloads sold here daily, mostly ventilated.

NEW YORK, Sept. 6.—Fresh fruit met the trying weather as well as any of the season. The prices are somewhat irregular, but prime stock sold readily. All good peaches to come are wanted, as the Bartletts and plums have run out. Tokay grapes have an early and an active start at remarkably fair prices. The others, except Morocco, are slow. The crop of Almoya grapes is expected to be 100,000 lbs. and Bartletts more than last year. The receipts of Pacific cars for the week amounted to 50. Eighteen sold on Tuesday, which indicates New York's ability to handle free supplies. The year, of course, is an exceptional one on account of the Eastern scarcity, but undoubtedly a large outlet is assured for the coast fruit, which anticipates other growths, and has obtained the widened introduction afforded by the situation. One firm sold 40 cars of Bartletts, $1.93@3.40 a box; $1.25@ 1.70 half box. Peaches, 95c@$3.25. These suffered. Nectarines, $2.10@3.10; figs, $1.30@1.65; prunes, $1.25@2.50; plums, 80c@$2.10; Tokay grapes, double, $4.45@5.90, prime; common and others, 80c@$3. The California Fruit Union sold eight cars of Bartletts, $2.80@3.35 per box; Beurre Clairgeau, $2.35@2.45; Duchess, $2.35@2.55; Beurre Hardy. $2.30@2.35; Egg plums, $2.55; Japan, $4.05@5 60; prunes, $1.20@2.20; Tokay grapes, $2.15@2.90, half box; Morocco, $2.10@ 2.75; others, 70c@1.55. Two private cars brought full prices.

NEW YORK, Sept. 8.—Sgobel & Day, agents of the California Fruit Union, sold two carloads of California fruit to-day at the following prices: Fellenberg plums, $1.80@2; Japan, $2.70; German prunes, $1.65; Gros, $1.70; Silver, $1.30; Bartlett pears, $2.85@3; Beurre Hardy, $2.25@2.70; assorted peaches, $1.15@1.75; Tokay grapes, $2.30@3.15; Malvoise, $1.15@1.60; Muscat, $1.05@1.25; Chasselas, $1.35; Rose of Peru, $1.25@1.80. Sgobel & Day report that Rose of Peru and Muscats are not wanted, but Tokays are in good demand. Bartlett pears are ripe, but peaches are too green and small.

CHICAGO, Sept. 8.—The Earl Fruit Co. sold California fruit to-day as follows: Beurre Hardy pears, $3.20@3.40; Bartlett. $2.60@2.85; Gros prunes, $2.10@2.35; peaches, $1.40@1.60; grapes, very soft, hf crates, Tokay, $1.25@1.55; Muscat, 85c@$1.25.

EXPLANATION. Cl. for clear; Cy. cloudy; Fr., fair; Clm., calm; — indicates too small to measure. Temperature, wind and weather at 5 P. M. (Pacific Standard time) with amount of rainfall in the preceding 24 hours. T indicates trace of rainfall.

CHICAGO, Sept. 10.—Arrivals of California green fruits continue heavy, and prices in consequence have ruled easy, though still in very brisk demand with prices as below: Peaches, Crawford, boxes, 20 lbs, $1.75; Orange Clings, $1.50@1.75; Salway Freestones, $1.10@1.65. Pears, Bartlett, green, $4 @4.25; do, ripe, $2.75@3.25; Duchess, $2.50; Beurre Clairgeau, $2.65@3; Beurre Hardy, $2.65@3; Howell, $3@3.25; Beurre Bosc, $2.40@3; Gros prunes, 20 lb boxes, $2.25@2.50; Egg plums, $1.50@1.60; Yerworth plums, 90c@$1; German prunes, $1.65@ 1.75; grapes, half cases, 4 baskets, Muscat, 75c@$1; Tokay, $1.10@1.80; Damascus, $1.25@1.50; black Morocco, $1.25@1.50.

A little better feeling has come over the dried fruit market. The demand for evaporated apples has been somewhat renewed. Arrivals are light, with some nice lots of new goods received which are held firmly. Holders are disposed to sell, for they realize that prices are high, and yet consignments are firmly held. Buyers, while desiring to purchase, cannot always reach up to top figures asked, so that it requires a little persuasion on both sides to bring about trading. Apple-cores and skins and chopped goods have again come into favor, and during the last few days several good-sized lots have been sold. New lots of old peaches which remain are steadily held.

CHICAGO, Sept. 10.—Porter Bros. sold 10 carloads of California fruit to-day as follows: Bartlett pears, $3 60@4.20; Beurre Hardy, $3@3.05; Beurre Clairgeau, $2.99; Tokays, full crates, $2.25@ 4.25; do, Muscat, $1.60@2.40; half-crates, Muscat, 85c@$1.30; do, Tokay, $1.20@2.15; half-crates, Rose de Peru, 90c@$1.25; Cling peaches, $1.40@ 1.75; Cornichon. $1.40; Silver prunes, $1.30; Fellenberg, $1.35; Gros prunes, $2.55.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR WEEK ENDING SEPT. 2, 1890.

435,785.—GATE—Jos. Albers, Corvallis, Or.

435,553 —KNIFE-SHARPENER — J. S. Blood, Napa, Cal.

435,622.—ORE-CRUSHER—John M. Bryan, S. F.

435 556.—SAW-BIT HOLDER—S. H. Chase, San Jose, Cal.

435,557.—CHIMNEY—L. E. Clawson, S. F.

435,561.—CLOTHES-DRIER—F. Frank, Suisun, Cal.

435,562.—CONCENTRATOR — Geo. Gates, Drytown, Cal.

435,563.—PLATE-LIFTER—D. B. James, S. F.

435,840.—SOLDERING-CAN BODIES—M. Jensen, Astoria, Or.

435,651.—FRUIT-STONER—P. Maisonneuve, Oakland, Cal.

435,509.—INSECTICIDE—W. Mann, Fresno, Cal.

435,567.—GANG-PLOW FRAME—A. F. McMillan, Benicia, Cal.

435,854.—DECORTICATING MACHINE — J. L. Notley, Santa Cruz, Cal.

435,462.—YARN-WINDER—J. A. Shepard, Fossil, Or.

435,592.—JOURNAL-BEARING — F. H. Smiley, San Jose, Cal.

The following brief list by telegraph for Sept. 9 will appear more complete on receipt of mail advices:

California—Thomas B. Craycraft, Ponoche, waterway and gate for reservoirs; Ferdinand Frank, Suisun, sash-holder; John Ginty, San Diego, pipe coupling and expanding metallic sleeve; R. B. Sinclair, Alameda, assignor to the Sinclair Manufacturing Company of California, windmill; William Stephens, Santa Rosa, electrical traction apparatus; George H. Tucker, San Francisco, die for making lathing; Stefano di Vicchio, San Jose, and J. Mignola, San Francisco, refrigerator.

Oregon—Lewis J. Bergendahl, assignor of two-thirds to Mr. Taylor, Pendleton, Or., and J. Gagen, Port Townsend, Wash., snow-plow; Thomas P. Madill, Albany, fence making machine; Charles W. Fremain, Portland, steam ore stamp.

Washington—Jane Ford, Ross Station, steam cooker; Peter E. Frost and L. A. Connor, gaff point for vessels.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

CALL, INVESTIGATE, AND BE HAPPY.

It is said competition is the life of trade. Anyway it is death to high prices. Thus competition to be effective requires first, the goods offered must be at bottom prices and bottom prices necessitate low rates of invoices. Established in 1868, for 22 years, says Mr. Terry, we have followed this system. Our furniture, which is the best, both new and second-hand, from the advantages of our having cash capital at command, has been always offered at the lowest market rates and generally lower, our customers saving at least 20 per cent on their purchases. You can order as cheap by letter as though personally present. The finest line of rugs, carpets and furniture constantly on hand. Don't forget. Salesrooms 745 and 747 Market St. Jos. T. Terry & Co.

NEWSPAPER AGENTS WANTED.

Extra inducements will be offered for a few active canvassers who will give their whole attention (for a while at least) to soliciting subscriptions and advertisements for this journal and other first-class popular newspapers. Apply soon, or address this office, giving address, age, experience and reference. Special inducements to old agents.

DEWEY & Co., Publishers,
No. 220 Market St., S. F.

California's Stallions.

I beg to announce that, with a view of perpetuating the forms and characteristics of the leading stallions of California, I am issuing a series of lithographic likenesses. Each portrait issued will be an acknowledged likeness, the result of a close study of the horse and an artistic treatment of the subject. In order to secure for the series an immense advertising value, from a breeder's point of view, 4000 copies, at least, of each portrait will be issued.

Terms, $100 for first issue of 100 copies. In quantity, for advertising purposes, copies will be furnished at low rates.

H. BOYD, Artist.

268 Golden Gate Ave., San Francisco.

THE PACIFIC RURAL PRESS

THE LEADING AGRICULTURAL AND HOME NEWSPAPER.

[*A Standard Authority on all the Branches of California Agriculture.*]

To Advertisers.

The PACIFIC RURAL PRESS has a greater circulation and influence, *in the Pacific States and Territories*, than all the other agricultural weeklies of the United States combined Advertisers can reach nearly all the leading reading farmers through its columns. Established 1870. Circulation, choice and extensive. Rates of advertising comparatively very low. Subscription, $3 a year, in advance. Send for samples.

What Others Say of the "Rural Press."

PROUD OF THE RURAL.—We feel proud of the RURAL PRESS. It is a paper that we are not ashamed to send to our friends in the East. Every farmer on the Pacific Coast should take it, and it is a valuable paper for any one to read. We appreciate your efforts. Long may you live to bless our cause.—*James Blood, Santa Barbara Co.*

INVALUABLE.—I congratulate you on the *general excellence* of the RURAL PRESS, and consider it simply invaluable to all residents of the Pacific Coast.—*Frederick C. Sheldon, M. D., Los Angeles Co.*

THE RURAL BEST OF ALL.—I take from four to six papers but *if I could take but one*, I should unhesitatingly choose the PACIFIC RURAL PRESS.—*J. M. Asher, San Diego Co.*

DEWEY & CO., Publishers,
No. 220 Market Street, San Francisco.

Dewey & Co.'s Scientific Press Patent Agency.

OUR U. S. AND FOREIGN PATENT AGENCY presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American and foreign reports, files of scientific and mechanical publications, etc. All worthy inventions patented through our Agency will have the benefit of an illustration or a description in the MINING AND SCIENTIFIC PRESS. We transact every branch of Patent business, and obtain Patents in all countries which grant protection to inventors. The large majority of U. S. and Foreign Patents issued to inventors on the Pacific Coast have been obtained through our Agency. We can give the best and most *reliable* advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and Circulars free.

Price, postpaid 50 cts. Address PACIFIC RURAL PRESS Office, San Francisco, Cal.

THE KEROSENE LAMP AND ITS DEFECTS.—The frequent accidents that occur in the explosions of kerosene lamps furnish strong evidence that there is something wrong in their construction. A gentleman who is engaged in the business of selling kerosene lamps and oil stoves writes to the *Scientific American* as follows: "The present system of burning oil, both in lamps and oil stoves, seems like a satire upon this progressive age. A flame oxygenated by air currents to the fiercest heat is placed directly in contact with a brass tube through which all the oil consumed has to pass. Of course this tube, being always made of brass, is one of the most rapid conductors of heat, and soon becomes excessively hot. A better device for generating explosive gas could hardly be conceived. The worst of it is that the gas thus rapidly generated falls into the oil font and is all ready for an explosion the moment that the smallest part of it comes in contact with fire. A slight current of air will often convey some of this gas to the flame, when the conflagration or explosion is almost sure to follow. If some of our inventors would substitute some device for the present mechanical and scientific outrage, something not too complicated and expensive, I risk nothing in asserting that such a device, if brought before the public in a business way, would become universal. The horrors referred to have now become so frequent that they receive only a brief and passing notice in the daily papers."

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none out worthy men.

HOW TO DESTROY GERMS IN WATER. Dr. C. G. Currier says, in the *Medical Record*, that water is easily sterilized by keeping it at or near the boiling point for 15 minutes. Five minutes' heat is sufficient to destroy all harmful micro-organisms. Still less time suffices to destroy the disease-producing varieties which are recognized as liable to occur in water. Thus merely raising to the boiling point a clear water containing the micro-organisms of malarial disorders, typhoid, cholera, diphtheria, or of suppurative processes, and allowing it to gradually cool, insures the destruction of these germs. They are also destroyed by keeping the water for from a quarter to half an hour at a temperature of 170° C. Occasionally, however, very resistant but harmless bacteria may get into water. The brief heating renders them safe for eating purposes; but when it is desired to destroy every micro-organism that may be present in a contaminated water, it should be heated for one hour and allowed to cool slowly. It may then be used for cleansing wounds, or for alkaloidal solutions, which will keep indefinitely if no germs be introduced after the solution has been heated.

Complimentary Samples.

Persons receiving this paper marked are requested to examine its contents, terms of subscription, and give it their own patronage, and as far as practicable aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription, paid in advance, 5 mos, $1; 10 mos., $2; 15 mos., $3. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber, please show the paper to others.

Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, or beyond the time he intends to pay for it, let him not fail to write us *direct* to stop it. A postal card costing one cent only, will suffice. We will not knowingly send the paper to any one who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent. LOOK CAREFULLY AT THE LABEL ON YOUR PAPER.

THE PELTON WATER MOTOR

Affords the cheapest and most convenient power for Ranch, Vineyard or Dairy purposes, as well as for running dynamos for electric lights, pumps and every other variety of machinery.

It possesses in the same degree the wonderful energy and power that has made the Pelton Wheel famous in all parts of the world.

These motors are made of varying sizes, with capacities ranging from the fraction of one up to 15 and 20 H. P., enclosed in iron cases, all ready for pipe connections, and are warranted to develop a given amount of power with one-half the water required by any other wheel.

The cost, considering capacity and efficiency, is fully 50 per cent less.

Circular, giving full information, sent on application.

Parties writing for information should give full particulars as to power wanted, source of water, supply, with head or pressure. Address

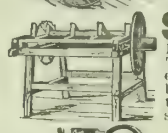
EVERY FARMER HIS OWN MILLER

Do your own Shelling and Grinding at Home, saving tolls and teaming to and from the Grist Mill. This work can be done rainy, windy days, when out-door work is suspended on the farm. The same Mill will cut corn stalks, saw wood, run churn, grindstone, pump water, etc. We make the

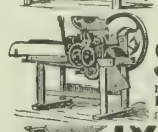
HALLADAY GEARED WIND MILL

in 11 sizes, 1½ to 40 horse power, and GUARANTEE they have no equal for Power, Durability and Storm-Defying Qualities.



Horse Powers

and **JACKS** both single and double Geared, made heavy and strong.

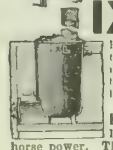


IXL 2 HOLE CORN Sheller

Adapted to run by hand, horse, steam or wind power. Not cheaply made, but strong, durable and effective in its working, yet light running. It is constructed similar to the large Power Shellers, and is the best 2 Hole Sheller on the market.

SAW TABLES

Both Swinging and Sliding Tables. We make a Saw Table especially adapted to sawing long poles. Special care is taken to make these machines strong and durable.



THE IXL STALK CUTTER

made in 5 sizes, with **Safety Fly Wheel, Safety Lever,** and all late improvements.

THE IXL IRON FEED MILL

3 sizes, both Belt and Geared Mills. Can be run by any power, and especially adapted to Wind Power. Will grind any kind of grain, and is the lightest running and most effective Feed Grinder made.

IXL TANK HEATER

For warming water in Stock Tanks. Made of the best quality of iron cast in one piece, no sheet iron to rust or solder to melt and cause leak. Will burn any kind of fuel. It is very effective and takes less care to operate than any other Heater made.

We also make the

HALLADAY PUMPING WIND MILLS

In sizes; 8 to 60 ft. diameter, and one man to 40 horse power. The **U. S. SOLID WHEEL WIND MILL,** 7 sizes. **Iron and Brass Pumps** in great variety. **Tanks** all kinds and sizes, and the **Standard Hay Tools** consisting of **Anti-Friction, Swivel, Reversible** and **Rod Hay Carriers, Harpoon** and **Grapple Horse Hay Forks, Pulleys, Floor Hooks, etc.** All goods fully guaranteed. Send for Catalogue and Prices. **Reliable Agents wanted** in all unassigned Territory.

THE

PACIFIC GAS OR GASOLINE ENGINE.

PATENTED JUNE 17, 1890—NOS. 430,504, 430,505, 430,506.
Also in Great Britain and other foreign countries.

Starts Instantly Without the Necessity of Boiler, Fire or Experienced Engineer.

The engine uses from 20 to 25 cubic feet of coal gas, or about one-eighth (1/8) of a gallon of gasoline per hour per horse-power. It can be used for pumping purposes, running printing presses, small factories, elevators, jewelers' lathes and polishers; dairymen's, agricultural, mining and wood-working machinery; well-boring and all other purposes requiring cheap and convenient power. Persons having but little space will find this the most suitable of all motors.

USE IN BOATS.—The Company make a specialty of ENGINES FOR SMALL BOATS AND LAUNCHES, and claim there is no engine in the market their superior for this purpose. Boats so fitted require no licensed engineer or pilot, as is required by law for all vessels propelled by steam power.

ELECTRIC LIGHTING.—The engines are PARTICULARLY ADAPTED and cannot be equaled for operating small electric light plants, either arc or incandescent.

STATIONARY and MARINE ENGINES
From 3/4 to 15 horse-power.
OVER 100 IN ACTUAL OPERATIO'

MAYFIELD, March 26, 1890.
PACIFIC GAS ENGINE CO.—We have given your little 1-H. P. engine a splend'd advertisement. A fire broke out at 2.30 o'clock this morning, in a tenement house on my premises. I started the e gine, connected the hose, and by its use saved at least $3000 worth of my property. I saved my blacksmith shop, lying 12 feet from the burning building, my barn and my dwelling. Three times the fire started in these buildings, and I extinguished it every time. The engine never faltered, and threw water between 50 and 60 feet high. The whole town was astonished, and they acknowledged that I saved at least $20,000 worth of property.
A fire department is being organized here, and I think they will have one of the engines on a truck for fire purposes. *They cannot be beaten.*
Hoping that all of your customers will be as well pleased with the engine as I am, I remain, Yours truly,
JOS P. PONCE.

TWENTY-PAGE EDITION.

Vol. XL.—No. 12. SAN FRANCISCO, SATURDAY, SEPTEMBER 20, 1890. { DEWEY & CO., Publishers, Office, 220 Market St.

STANDARD TROTTING STALLION DAWN 6407, OWNED BY HARRY J. AGNEW, HILLSDALE, SANTA CLARA COUNTY, CAL.

A Noted Trotting Sire.

The engraving on this page gives a portrait of the noted trotting stallion Dawn, son of the famous Nutwood, with a record of 2 18¾, and Countess, daughter of Whipple's Hambletonian. Besides Dawn, Countess is dam of Strathway, with a three-year-old record of 2:26 and trial record of 2:21; also dam of Placida and Morna, who made 2:26 as a double-team trial. The dam of Countess was Fly, whose get are said to have brought Mr. Whipple more money than the offspring of any other of his mares. Through Nutwood his sire, Dawn inherits the blood of Belmont, with his long string in the 2:30 list, and of Miss Russell, dam of the wonderful Maud S., with a record of 2:08¼. The descent from such sires gives Dawn a brilliant advantage, and he has proved himself fully worthy of his ancestry.

Dawn is now a nine-year-old; is a light chestnut, a horse of handsome style, of good size, of great bone and substance. He was formerly owned by A. L. Whitney of Petaluma, and is now the property of Harry J. Agnew of Hillsdale, Santa Clara county, proprietor of the "Agnew Stock Farm."

Though Dawn is comparatively a young horse, his progeny is showing unmistakably his quality as a trotting sire. Oaknut, at five years old, has a trial record of 2:24½; Silkey, also five years old, has a trial record as a green pacer of 2:30 and half a mile in 1:11; Daybreak, three-year old, has made 2:27½; Anne Bell, as a two-year old, 2:37; Nonpareil, a yearling, half-mile heats, 1:27; Dawness, a mile in 2:51. All these are trial records. These promising figures indicate what may be fairly expected of Dawn in perpetuating his inherited excellence and his own sterling individuality. Mr. Agnew has a fine band of brood mares, and his breeding enterprise for quality and skillful management is one of our leading establishments.

The Coming World's Fair.

Although there is still trouble about settling down upon a site for the World's Fair in Chicago, the people are assured that this local quarrel does not retard other arrangements which are going forward. However this may be, the Pacific Coast people are proceeding with preliminaries. The general convention in this city last week was quite fully attended, and after a day's discussion intrusted the subject to an Executive Committee, which has organized and begun work. The State has been divided into 13 districts outside of San Francisco. There will be eight members from San Francisco and one from each of the outside districts to form an Executive Committee of 21. This committee will have charge of the work of preparing the California exhibits for the World's Fair. It is the intention to ask an appropriation of $1,000,000 from the next Legislature of the State to enable the work to be carried on properly. There is a proposition on foot to make a combined exhibit of all the Pacific Coast States, instead of having the products of California separate. This proposition will be discussed, but the opponents of the measure are apparently largely in the majority.

New Mexico's Territorial Exposition opened at Albuquerque on the 15th, with 2000 visitors attending. All the space is taken in Exposition hall, and the display of fruits, such as peaches, apples, pears, grapes and melons, is very remarkable. The mineral exhibit from Socorro county alone will amount to thousands of dollars, and was prepared to be sent to Chicago for exhibition at the World's Fair.

Our Pork Wanted in France.—A dispatch from Bordeaux says: The Gironde Council-General has sent a resolution to the Government demanding an early repeal of the law prohibiting the importation of American salted pork.

CORRESPONDENCE

Correspondents are alone responsible for their opinions.

Early Notes from the State Fair.

EDITORS PRESS: Entries have been slow this year, probably owing to fairs at other points and Admission-Day celebration in S. F., etc. I send you a few early notes from the park.

Cattle.

As you turn to the right from the main entrance, you find the exhibit of P. S. Chiles of Davisville, consisting of seven Shorthorns. There are an aged bull, a two-year-old and a yearling, and four very fat cows. Then come vacant stalls understood to be reserved for Mr. Burke's famous herd of Holsteins soon to arrive.

G. B. Polhemus of Santa Clara comes next with 16 head of Holsteins showing remarkable milk development. They are milking seven cows in the herd and milking them three times each day.

The array of milk-cans is quite formidable, and as they are feeding beets, bran, crushed oats and oilmeal, we judge them to be experts at exhibiting cattle for milk. It is as much of a trade as to train and drive fast horses. A pedigree that shows something is that of King Aaggie Clothilde, which gives the milk and butter records of his female ancestors. The six nearest averaged 22 pounds 5¼ ounces butter per week, and the eight nearest averaged 16,617⅜ pounds of milk per year. The longer a pedigree the better if good animals are named, and the reverse if animals are bad. Tell what they have done and we can judge what they are.

T. B. Hall of Marysville shows 20 head of very fine Holsteins fit to compete anywhere. He is located in the elegant new barn a little farther down the avenue from Mr. Polhemus' herd.

Away over beyond the sheep and swine pens is the Holstein exhibit of the Bonnie Brae Cattle Co. of Hollister, J. A. Scholefield manager. The herd consists of seven cattle, with Lady Fay's Artis at head of herd. Lady Fay has a record of 97 pounds 5 ounces milk in one day and 24 pounds butter in 7 days, without having been fed grain. The sire and dam of Artis are both in the "Advanced Register." For entry in this a cow must have produced 65 pounds of milk per day for ten consecutive days when in her five-year-old form. For a bull to be recorded in this registry, his daughters must have been entered.

A Suggestion.

There are several herds each of Durham, Holstein, Jersey and Black Polled cattle, and they are scattered as though on purpose to get them as far apart as possible. Those interested are generally fanciers of some one of these breeds to the exclusion of others, and it would add greatly to the convenience of visitors and advantage of exhibitors to have each breed by itself.

Coming down the main alley, after passing the Polhemus herd of Holsteins, a large number of stalls are reserved for the Younger Shorthorns, expected to arrive to-night. Then come 20 head of very fine Shorthorns from Peter Peterson of Sites, Colusa county. The herd has been well known as prize-winners for several years. The famous bull Counsellor is followed by 13 of his get, ranging from four months to four years of age. He will show a beef herd, young herd, and compete for prizes offered for milking Shorthorns. His cattle excel in uniformity of color, and combine size, quality and milking capacity in a remarkable degree.

Across the alley from him, A. Heilbron & Bro. of Sacramento make an exhibit, from their Tulare ranch, of 26 Shorthorns and 19 Herefords. Some of these were illustrated in last week's RURAL, and the animals themselves give a better impression than the cut. He breeds both red and roan Durhams, but aims to keep them separate. He shows 7 roans and 19 reds. One three-year-old Cruickshank bull is a remarkable animal, and several cows would attract attention anywhere. Mr. Heilbron butchers on a very large scale, besides his breeding interests.

Herefords.—He also shows 19 animals of this famous breed and thinks they are, as a rule, more easily kept, more uniform, and more given to turning grass into beef than any other breed.

Angus—American River Herd.—J. C. Camp of Perkins shows 13 head, among which are the famous cows Lady of Lakeview and Lady Guind. Besides these 13 he has at home a few thoroughbreds and 70 grades. His herd is at the farther end of the main alley on the left.

On the right of the main alley, just as you pass to the racetrack, are 11 cattle from the Jersey herd of W. C. Smith of Florin. These are all registered in American Jersey Cattle Club, and have been large prize-winners.

Black Polled cattle are represented by the Argonaut herd of Aberdeen Angus cattle, 10 head of remarkably fine cattle shown by Dr. Dixon of Sacramento.

W. B. Gibson of Woodland enters the contest with 11 head of Galloways, headed by Little Wonder—just little enough to weigh a ton. These are to be found back of the sheep-pens near the Bonnie Brae headquarters. Very near them is a fine herd of Jerseys shown by P. Stanton of Brighton. As he is milking five head and Mr. Smith several, we hope the representatives of dairy fixtures will come out here and make some milk and butter tests. Neither of these Jersey exhibitors say anything about tests. Tests are the life of their breed.

Andrew Smith of San Mateo makes a remarkably fine display of Berkshire and Poland China swine and of Shropshire sheep. Otherwise, these and the poultry departments are as yet practically empty.

H. W. Jeans of Blocksburg, Humboldt county, shows a very fine pair of mules and two jacks.

J. D. Rosenberger of Sites shows four jacks, and has a whole pasture full at home to draw upon.

Draft horses are well represented, but we cannot go into details. More and better next week. F. S. C.

Grapeland, San Bernardino County.

EDITORS PRESS:—It has been but a short time since your paper (to my mind the most valuable in the State) found its way into our little settlement, but I must tell you that it finds itself a very welcome visitor.

I called this place a settlement because that is all I can call it. There is nothing here but a few neighbors and a postoffice. However, we hope to be of more importance some day, as we now have an irrigation district formed and the new places, as well as many of the old ones, are being improved and set to vines and fruit trees.

This seems to be one of the finest locations for fruit trees, especially peaches and raisin-grapes. Our peach trees are so laden with fruit that we have to use props for most of them, and some of the limbs are already broken.

I wish to speak of something that the readers of the PRESS who are in the fruit business may not have noticed. There are some varieties of peach that will not bleach; that is, it ruins the fruit both in color and flavor to expose it to the fumes of sulphur. We have a large, white freestone peach that has a delicious flavor, is perfectly formed, and is of a bright red color around the seed. After bleaching, it is of a very dark brown all the way through, and has a disagreeable sour taste. We have tried it two years and it was the same both seasons.

We dried about 1000 pounds of Green Gage plums, and they are excellent, the more so because we took the stones out of them; so the lady who is fortunate enough to get some of our plums when she buys, will not have to stone them for her Christmas pudding.

I should be pleased to have some kind reader who has had experience, give me a recipe or a few hints on prune-drying, for which I will gladly return the favor if it is in my power.

MINNIE D. PERDEW.

Grapeland, Cal.

THE VINEYARD

Resistant Vines.

EDITORS PRESS:—I have been reading very carefully Mr. West's and Judge Stanly's letters on the subject of grafting vines on the so-called resistant roots, but I have not found anything on one, to me, important point, and that is the *quality* of the grapes, and also if any characteristic appearances of varieties are in any way changed. I would be pleased to hear of some close observations on these subjects through the columns of the PRESS.

Assuming that all our improved varieties have been bred up and developed from the original wild vine, I have always been suspicious that it might be a step backward on the road of progress to graft on the original wild vine. It is well known that many tree stocks sometimes materially affect the fruit of grafts and buds. I have just had my attention called to this subject by finding that a clingstone plum I had grafted on a peach tree had become a perfect free-stone. This certainly opens a wide field for experiment and investigation for some horticultural Darwin to study the laws of hereditary descent in plants.

As yet, not to my knowledge, have we had any phylloxera up here in Lake county. But to those planting the wild vine I would say: "Be not too sure of lasting success." It is undoubtedly true that insects and animals may under changed conditions become changed in habits, instincts and forms, and also that new forms are evolved. I am inclined to the opinion that the resistance is the result of a slightly increased vigor through the wild vine roots, and not from any inherent quality. This suggests the use of some stimulating fertilizer. [This idea has been widely applied to practice. Fertilizing prolongs the life of the vine, but does not save it.—EDS. PRESS]

I wish to ask if the sulphate of iron (copperas) can be made and sold as cheap as sulphate of copper (bluestone). I read of the wonderful fertilizing effects of the former above the latter. It would seem it should be cheaper, as iron is a cheaper metal. It is not probable that it would have so good effect on the red land, as it is mostly iron ore.

Lower Lake, Sept. 5. C. P. SCRANTON.

[Copperas can be bought in this city at 1½ cents and bluestone at 6½ cents per pound in barrels. Our correspondent is right in the surmise that the use of copperas as a fertilizer would be of little or no account in a soil already loaded with iron oxide.—EDS. PRESS.]

FORESTRY.

Open Letter on Timber-Cutting, Etc.

EDITORS PRESS:—The letter below is of public interest and is fairly typical of many similar inquiries received by this board. We publish it as explanatory of our rejoinder.—WM. S. LYON, for the Board.

SHASTA CO., CAL., Sept. 20, 1890.

To State Board of Forestry—GENTLEMEN: I have read that it is against the law to cut any timber on Government land. Now I would like to have some shakes and have got no timber for the purpose nor money. Can I go up the mountain and cut a sugar pine down and split it up into shakes for my own use? If you please, kindly answer this question for me. Inclosed you will find a two-cent stamp. Respectfully yours, A SETTLER.

Reply.

A SETTLER, ESQ.: Yes, dear sir, your interpretation or reading of the law is entirely correct, and the cutting of that sugar pine upon which you have cast covetous eyes will surely consign you to limbo and the reproaches of all God-fearing citizens. You should know that the deadly machinery of the law is oiled and full-cocked for just such premeditators of evil as yourself. Further, to side-track temporarily the moral features of the case, you must not overlook the fact that the tree in question, according to the price the Government sells its timber lands for, represents a national asset of from 15 to 50 cents, this value varying in accordance with its size and remoteness from or accessibility to a market; and that it will only cost the nation from $500 to $1000 to follow, drag you up to the bar of justice and vindicate upon your person or pocket, or both, the majesty of the offended law. The more remote and less valuable the tree, the more certainty there is of your speedy attainder.

Remoteness hath a charm for the Deputy U. S. Marshal; it stimulates the sleuth-like proclivities; it means increased per diems, increased mileage and increased traveling expenses. It gratifies his love for solitary communion with Nature as he finds her in a mountain resort and enables him to shake dice all day under the heading of "incidentals," while gleaning from your dearest enemy the damning chain of evidence that stamps you as a malefactor and felon.

Again there are the very shakes themselves to confront you with; they "split" on you so to speak, and if these be made from a good cut, leave you no knot-hole of escape from the myrmidon who seeks only evidence that convicts, for thereby hangs all of his glory and much of his plunder.

If in the face of this warning you still incline to shelter your head from Shasta's summer solstice or winter's snowy storms, we suggest that you go a step further and add the trifle of arson to your contemplated misdeeds and cover up your tracks with fire.

If a likely, active fellow, and you select the dry season and a windy day, you can start a fire that will quickly wipe out the evidence against you and perhaps a quarter million dollars of public property; the shakes will haunt you, follow you up like an avenging and remorseless Nemesis—the fire, never. They must catch you *in flagrante delictu*, which means that the Government agents must be afield and alert at all times, which would cruelly handicap their social diversions in the mountain saloons, and if you are any way discreet the chances of obtaining direct evidence against you are so slim that you need hardly fear close investigation; the result of impeaching you could only be in the interest of the public good—not the financial gain of the zealous conservator of the public timber who only moves on "dead things."

If you rive out more shakes than you require, by all means try to sell some to your neighbor; incidentally this will clinch the evidence against you but furnish the wherewithal to secure such cold comfort and relief as an occasional stamp invested in the direction of the General Land Office (the proper authorities) may afford.

A correspondent whose moral perceptions are so blunted that he is capable of confessing to both poverty and the attributes of good breeding indicated by the inclosed stamp, is such an anomaly in this generation that we are prompted to look upon your request with some suspicion, and if you would earn aught but the contempt of the public, you must at any rate promptly redeem yourself from the stigma of impecuniousness; buy a flock of sheep and steal pasture for them from the public domain.

If industrious, your flocks can trample out and destroy the forest prospects of Shasta county for generations to come; and if the work of annihilation proceeds not quickly enough, a touch of the torch will accelerate matters and assure you of a grass crop the next season.

Meantime your prestige and standing in the community as a wholesale plundering robber of the public timber lands will entitle you to a consideration at the hands of the General Government that they will never accord to the petit larcenist of a few shakes.

The efforts of this Board to whom your appeal is made have been for some years directed to convincing the Congressmen from your State and district, and who are directly responsible for the present condition of affairs, that a little surveillance of you after you have bloomed out a fire-fiend, pasture brigand and all-around outlaw is a more important matter than a too close scrutiny into how you came by your woodpile or bunch of shakes. So far, they have seen fit to differ from us, and continue to strain at gnats and swallow camels, and the chances are that if you cut that sugar pine, they will strain you so fine through the meshes of the U. S. District Court for the Northern District of California that you will be indistinguishable from a Shasta county gnat. Our advice is that you don't.

STATE BOARD OF FORESTRY,
By W. S. LYON, Forester.
Los Angeles, Cal.

THE APIARY.

Foul Brood.

EDITORS PRESS:—I should think, judging from what is said on page 194 of the PRESS, that it was not generally known that California had a State law seven years ago, which is still in force, against keeping foul brood. I inclose a good description of foul brood, taken from the Michigan State Agricultural College Bulletin, No. 61, by A. J. Cook, and attach the California State law for a remedy. I can vouch for the effectiveness of the remedy, for I was one of the first inspectors appointed under that law, and applied the remedy to about 300 colonies in Ventura county, with the best results. I also inclose a description and cure of the nameless bee disease which has destroyed quite a number of colonies in California. I have tried superseding the queen with a healthy one, and in every case the cure was complete. J. F. MCINTYRE.

Fillmore, Ventura Co., Cal., Sept. 9, 1890.

Foul Brood.

This is the result of the growth and development in the brood of bees of a bacillus, which has been named by Mr. Cheshire bacillus alvei. These bacilli look like short rods, and when magnified 1000 times appear about one-fourth of an inch long. Thus we see they are exceedingly minute—only 1 4000 of an inch long. And yet the spores are even smaller—from one-third to one-half as long. I have stained specimens taken directly from diseased brood, and from cultures in tubes, where a little of the decayed brood was placed in a preparation of beef decoction. In this last case the media in the tube was soon swarming with the bacilli. All look just alike, and just like those from the decaying brood. If we take a section of a rather small black pin one-fourth inch long, we will have just about the appearance of these stained foul-brood bacilli. From what we have already learned of these organisms in general, it is easy to study this special foul-brood bacillus. The minute ovoid spores are brought to the hive probably in honey fed to or brought in by the bees. It is easy to see how honey in a diseased colony of bees would receive these spores. It is difficult to see how it could be free from them. The spores might also be introduced by giving combs containing the diseased brood or which had previously contained it to the bees, and so now would have the dormant bacilli or spores. Undoubtedly foul brood is usually first introduced through the honey, while it is often spread rapidly by an exchange of combs in an apiary where only a few of the colonies are affected. While the bacillus cannot develop in the honey, very likely the honey serves admirably to hold and preserve the spores.

Appearance of the Brood.

When the larval bee is once affected, it is disturbed, lies differently in the cell from the healthy larva, soon turns yellow or straw color, then to brown, while the skin seems loose and flabby. Later the mass becomes thick and viscid and turns dark-brown, the color of coffee before any cream is added to it. It now dries up, and at last forms a thin layer over the bottom of the cell. While in the putrid coffee-colored state, if drawn out from the cell by inserting into it a pin-head, it is stringy, and if it fails to hold to the pin it will fly back. This brown, stringy, elastic mass, with no resemblance to a larva or pupa, is, I think, a sure proof of the presence of the dread malady. The larva may never be capped over, but if attacked late in its development it usually will be. This cap, however, will appear sunken or concave instead of being convex or rounding out as the cappings of brood always do when the brood is healthy. These sunken caps are always suspicious, and should always lead to close investigation. Little irregular holes in the cappings are often seen, which also should awaken suspicion. Another indication not always marked in the early stages is a rank smell, which has been compared to the odor of old glue.

California Law Against Foul Brood

California Statutes 1883: Chap. 58

The People of the State of California represented in Senate and Assembly do enact as follows:

SECTION 1. The Board of Supervisors of any county wherein bees are kept are hereby authorized to appoint one or more persons as inspectors of apiaries, to hold office during the pleasure of said board.

SEC. 2. The Board of Supervisors shall fix and determine the compensation of inspectors of apiaries, to be paid out of the funds of the county not otherwise appropriated.

SEC. 3. Upon complaint being made to the in-

spector, to the effect that in complainant's opinion the disease known as "foul brood" exists in any apiary in that county, it shall be the duty of such inspector to inspect such apiary as soon as practicable and direct the person in charge thereof to destroy all hives ascertained to be so affected, together with the combs and bees therein, by burning or burying the same in the ground the following night.

SEC. 4. If the owner or person in charge of an apiary, by his own inspection or through any other source, discovers foul brood in any hive in said apiary, it shall be his duty to destroy such hives and contents in the manner provided in Section 3 of this Act.

SEC. 5. Any person failing to comply with the provisions of the last section shall be deemed guilty of a misdemeanor, and upon conviction thereof shall be punished by a fine of not less than five dollars nor more than twenty-five dollars for the first offense, and by a fine of not more than fifty dollars for each subsequent offense.

SEC. 6. This Act shall take effect from and after its passage.

The Nameless Bee Disease.

Within the past two years much complaint has been made by bee-keepers of a disease among bees, which not only depleted the colony but was made manifest by the appearance of the diseased bees. They look black because of loss of hair, much as do robber bees, or old bees in spring, and frequently make strange motions in front of the hives, as though dancing or in convulsions. They are frequently dragged out of the hives by the other bees. This, like foul brood, is supposed to be due to fungoid attack. In this, only the mature bees seem to become victims, though the inoculation appears to come through the queen. Thus it is found that superseding the queen with a healthy one cures the malady. It is also reported that abundance of salt water placed close by the hives, where the bees can gain ready access to it, will cure this "Nameless Bee Disease." It would seem that this malady is the same that has received attention in Europe, and which Mr. Cheshire has said was due to the attack of bacillus gaytoni.

Bee Notes.

EDITORS PRESS:—Beginners in bee culture should content themselves by following the rules of prominent apiarists. Work up slow and sure is the best way. To commence with too many colonies at once, the beginner is almost sure to make a failure.

A few shrubs or bushes around the apiary are useful as settling places in swarming-time; but these should not be too near the hives so as to prevent the free flight of the bees to and from their work. Some low plants of some kind near the hives will provide acceptable resting-places for tired workers returning from distant fields. Grapevines make a very desirable shade for bees in summer. If I were starting a new apiary I should plant a grapevine at the corner of each hive.

As regards the quarter of the compass toward which the hive should face, there is comparatively little difference. When picking out a location for an apiary the position of trees, buildings, etc., must be taken into consideration. An apiary should not be located too near a dwelling-house or near a public highway. If you have a small place and are forced to keep your apiary near a highway, plant out a hedge of osage orange trees or something of that sort; and as soon as they are high enough (about 10 feet) your bees will not bother travelers along the roads; because when they are coming and going they necessarily fly high in order to get over the hedge. A row of poplar trees planted close together will soon form a good wall to keep the bees from the road and will also form abundant shade in summer.

The position of hives should not be shifted without very strong reasons. Even if moved a few feet it confuses the returning bees so that sometimes they never find their hive. If you have occasion to move a hive a short distance, it is a good idea after getting it moved to place a few sticks of wood before the entrance, in order to make the bees take notice and mark their new location. If you move bees two or three miles there is not much danger of their returning to their old home. Occasionally it becomes advisable to make new changes, as in dividing bees, uniting, etc., but then no bad results will ensue because at the old location part of their old home is left. If bees are united right there is not much danger of their returning, but if they do, place a hive containing a frame of unsealed brood where their old location was, and at evening remove the frame of brood and place it where you want it.

There is a vast profusion of asters, golden-rod, etc., in bloom at the present time; and bees in this section of California are slowly storing honey from this source. The neighboring gardens and clover-fields also furnished considerable honey this season.

Do not allow a colony to starve to death the coming winter; it does not cost much to feed a few needy ones, and they will repay you fully the coming season. Feed with a good feeder in the upper story at night; remove the feeder in the daytime, as the smell of the feed may attract robbers, and if it is a small colony you are feeding, the robbers may possibly gain admittance.

Do not be on the lookout for bee moths all the time; get rid of all your black bees and stock up with Italians, Carniolans, etc. All these men with patent moth-traps for sale should invest in a few queens of the races mentioned.

When you make your first examination of your apiary in the spring, be sure and remove all drone comb from undesirable colonies and replace with worker combs and comb foundation. An extensive Eastern apiarist makes the assertion that every square foot of drone comb removed is equal to a dollar saved, and from what experience I have had in the matter, I think so myself.

Honey should not be extracted when first gathered, as it is unripe, and if not ripened artificially it will scur. In this matter of ripening honey you should judge for yourself, as honey from some varieties of plants requires a greater length of time than others. Give the bees plenty of room and plenty of time to ripen it. S. L WATKINS.

Grizzly Flats, Cal.

FRUIT MARKETING.

Fruit Sales in New York.

EDITORS PRESS:—My sales on Tuesday, September 2d, of 15 carloads of California green fruit are worthy of note and comment for several reasons. This number of cars was the largest that had ever been sold by any one receiver, in any one market in the United States in one day, so far as California products are concerned.

This is very significant because the Chicago market has been one that was supposed to be able to take more California fruit in one day than any other in the United States.

Inasmuch as there was a total of 18 cars sold in New York on Tuesday, with results as below given, which certainly indicate good prices for everything that was good, as against and in comparison with Chicago's sales of about ten day's ago, of a similar quantity of cars, when results were very disastrous, would seem to indicate that the New York market is certainly one of tremendous extent.

These 15 cars that I sold comprised about 3500 boxes of Bartlett pears, which averaged about $3 per box; about 4000 boxes of peaches, which ranged in prices from $1.50 for anything of fair quality to $3.25 for the best fruit; 1600 boxes of plums and prunes in every variety, which ranged in price from $1.25 to $2.35; about 2500 packages of Tokay, Muscat and other varieties of grapes, which sold at from $1.25 up to $3 for packages containing 18 lbs., and for crates of 40 lbs., the range being from $2.85 to $5 75.

These results prove conclusively the fact of our market being able to take anything good, and paying good profitable prices, no matter the quantity.

It will be interesting to note further in connection with this, how these 11,600 packages were handled and disposed of by me. To prepare the sale of this enormous quantity of fruit it required about 40 men to unload the cars, properly put each and every one of the 400 different lots of fruit into shape for the sale, some of these men being engaged from 12 A. M. Tuesday morning till 1:30 A. M. Wednesday morning, thus being on continuous duty for over 25 hours without rest or sleep.

To dispose of the 400 lots of fruit consumed 4½ hours of continuous selling at auction on my part. To deliver the fruit required the service of over 50 trucks, that commenced to load at 11:30 A. M. and finished delivering at about 12:30 at night. The buyers who purchased this fruit were composed of the regular fruit-jobbing trade of this city, and of representatives of about 40 firms doing business within the territory bounded by Providence, R. I., and Philadelphia, Pa., and numbered about 200. This sale illustrates two patent facts: first, that the ability of N. Y. to take an immense quantity of goods and pay good prices is fully demonstrated; and second, the auction system for disposing of perishable fruit is the only one that could possibly be used to market such a vast quantity of any products, that included so great variety, condition, quality and kind, as comprised the 15 carloads of fruit I sold. Illustrating still further another feature of the auction method, I would say that of the 100 shippers that made up this total of 15 cars, every one was in possession of the results of his sales within 24 hours after the same took place. E L GOODSELL

New York, Sept. 4th.

POULTRY YARD.

Disaster in a Flock of Poultry.

EDITORS PRESS:—First, I now want to say something to you and to your readers; then, after that, I want to know something; and I am willing to get what I want to know from any one who knows it and who will have it printed in the RURAL PRESS.

I reside in about the center of Pajaro valley, Santa Cruz county, about one mile easterly from Watsonville, and have resided there for over 15 years, on land which is partly rich sediment and partly black strong loam (not adobe). In all those years I have raised from 50 to 200 chickens yearly. They were not thoroughbreds but were well graded; mostly compounded of Plymouth Rocks and Brown Leghorns, very evenly crossed. And let me here say that such a cross is a good chicken for either abundant eggs or good meat. The appearance of the Rocks predominates, but the speckling is tinged with a browning which I think rather improves the appearance.

What I wanted to say was that last May I had between sixty and a hundred chickens, none of them old and some of them quite young. They all tumbled over in the yard or off the roosts, one after the other, until in a week there was not a live fowl on the place. They were regularly well fed on wheat, had plenty of range, roosted in leafy trees surrounded with barns, fruit-houses, etc., though there is a fairly good hen-house in the yard. They showed no external signs of disease—none whatever—were not verminous, had no swell-head, but they would look a little droopy for about one day and then either fall dead off the roost at night or else drop down while walking on the ground—dead—with their feet drawn up under them and the head turned under the neck.

Now what disease was that? That is what I want to know; also, how to avoid it or how to cure it.

I had some of them cut open, autopsied. The meat looked healthy; in the laying hens the eggs were forming in different stages of growth. There was nothing wrong with the swallowing machine, but the craws were about empty of everything but the usual gravel.

I have not now a chicken on the farm. If old St. Peter was on my farm now he would wait a long time to hear the thrice crowing of that rooster or any of his posterity.

It is curious. Persons residing across the county road about the distance of a stone-throw have not suffered, but a Mr. Smith, some four miles distant, near the south side of the valley, saved 12 chickens out of 200. I never had anything like that chicken holocaust happen before. J. W. GALLY.

Aug. 23, 1890.

[We hope some of our readers will explain the disaster in Dr. Gally's poultry department. —EDS. PRESS.]

THE STABLE.

A Profitable Stallion.

Sable Wilkes, says the Redwood *Gazette*, has now been permanently retired from the turf to the stud, and considerable interest is being manifested among breeders of trotting horses as to his future as a sire. He is located on the ranch of his owner, Mr. William Corbitt, at the San Mateo Stock Farm. Sable Wilkes held until last year the world's three-year-old stallion record, and is now the second greatest male performer of that age, Axtell alone surpassing him.

His greatest value, however, is in his ability as a sire, and the high estimation in which he is held by his owner is attested by the fact that $65,000 has been refused for him. He is now five years old, and his oldest colts are yearlings, but a number of these now being trained by John Goldsmith show such marvelous bursts of speed that his future as a great sire may be safely said to be established.

"I have eight yearlings by Sable Wilkes," says Mr. Corbitt, "and they show such wonderful trotting action and marvelous speed that I have arrived at the conclusion that as a sire Sable Wilkes will prove more valuable than his sire. Out of the eight youngsters of his get, six have been broken, and two of them, out of Arthurton mares, have, with very little handling, gone quarters in 37 seconds, or a 2:28 gait.

"Guy Wilkes has, during the past season, been bred to about 50 mares, 23 of which were sent to San Mateo, from Kentucky, Louisiana and other Eastern States, the fee being $500 each. I have been offered $40,000 for the use of the horse to 40 mares if I would send him to Kentucky for a season. His book for 1891 is already filled, and I have been compelled to refuse many applications.

"It is my intention to have a sale in New York next March, and I propose to send on about 50 colts, the get of Guy and Sable Wilkes."

KEEP HIM TURNING.—"When a horse stops and proposes to turn around," said a liveryman the other day, "don't resist the turn, but give him a quiet, horizontal pull in the direction he wants to turn, so as to carry him farther around than he intended to go, and if possible, keep him going around half a dozen times. In most cases this will upset his calculations, and he will go quietly on without much ado. If six turns will not do, give him 20. In fact, if he will keep on turning to your rein, you are sure to conquer, as enough turning will certainly confuse him and leave him at your command. If he will not turn and will back to the rein, keep him going backward in the direction you want to go. He will soon get tired of that and prefer to go with the right end forward, but before you let him go, give him decidedly more backing than he likes."—*N. Y. Sun.*

THE custom of burning the straw before the approach of rain each year, thus impoverishing the land, has been going on in this valley since cereal farming began.—*Salinas Journal.*

THE DAIRY.

Co-operative Dairying.

EDITORS PRESS:—From time to time there have appeared in the RURAL PRESS statements to the effect that the stock of a dairy was sold on account of the business having ceased to be profitable. In last week's RURAL I noticed that the dairymen of Santa Maria had organized to overcome the "systematic steal of the commission-men."

In the sixties I lived in the dairy section that furnished Philadelphia with the greater portion of its milk. For years the dairymen were systematically fleeced and impoverished, while the owners of city milk-routes grew wealthy. The milk was not only stolen by reported shortage and damaged condition, but a well-developed plan of robbing was perpetually carried out. The dairyman was assured that Mr. Watermilk could sell all of his product and at a very satisfactory figure. The milk was promptly furnished, and for a time the returns were prompt, and neighboring dairymen were persuaded to ship their product to the same dealer. Soon the returns were short, and continued to grow less and less. The shipper endeavored to collect but found it difficult work; finally, in despair, he would stop shipments, and on investigation find that the bill could not be collected from the Oily Gammon Watermilk. Mr. Watermilk would in the meantime arrange with other dairymen for the milk of their dairies, and thus keep himself in constant supply of free milk.

To overcome this, the farmers organized. They placed a No. 1 man in charge as president at a big salary, as they claimed the business needed a good man, and the best way to secure him was to pay him sufficient to make it an object to him to give the business his entire attention. In a month's time the plans of the company were in operation and the following system carried out:

The farmers own their milk-cans, which bear their names. These are brought to the railroad stations by the dairymen in time for the "milk-train." The cans are placed on the station platform and the dairyman gathers up the cans brought up on the "milk-train" as it passed up the evening before, and then drives home to his work.

On the milk-train travels the association's agent, who counts the cans at each station, credits the shipper on his account and places the milk-cans back in the cars. Arriving at Philadelphia, the milk is taken to the company's store, where it is placed in the association's milk-wagons and sent out by their own drivers. The empty cans are back in time for the evening train up. At the close of each month every shipper in the association receives a statement of his account showing his credit after the expenses are deducted. At the end of the year the members meet and divide their surplus and elect officers and directors for the coming year.

By this simple, business-like method of co-operation the dairymen get all the profit there is in the business and the consumer is satisfied that the milk he buys is pure, as the company has nothing to make by adulterating, and by their system of testing, any attempt by too zealous dairymen to "water the stock" other than by the cow's mouth is checked.

This same system could be applied to milk, butter, eggs and honey, jointly or separately. The farmers *must* organize and exert brain as well as muscle, and if not blessed with sufficient capital themselves, organize a trust for their special benefit. I look for great things from the Alliance. E H. SCHAEFFLE

Murphys, Cal.

A Butter Monument.

The advantage of the sea breeze to the dairymen along the immediate coast in the upper part of California and northward into Oregon and Washington is seen in an observation which a traveling writer for the Washington *Farmer* made during his visit to Whidby island, as follows:

At the head of Dugualla bay is a large drained peat marsh. Of four ranchers on this marsh, three of them were engaging principally in dairying. Owing to the cool ocean breezes blowing across this part of the island, the summers were remarkably cool, making it one of the best dairying regions in Washington.

Visiting Capt. Mariatt's place, we were shown a column of butter some three feet square and four feet in hight, which was standing in a low-roofed shed near the house. This mass of butter had been built up during the spring, summer and fall months, and where sampled, seemed to be comparatively sweet. What condition the whole column was in, otherwise than being hard, I am unable to state. It is sufficient to say, for the purpose of showing how well adapted that section is for dairying, that that butter remained hard enough to retain its shape all summer. It had no covering other than a thin muslin cloth.

IRRIGATION VOTED.—Murrietta, San Diego county, voted, on the 4th inst., to organize an irrigation district. Considerable interest was displayed, and a heavy vote was polled. The result was unanimous in favor of forming a district.

PATRONS OF HUSBANDRY.

In our Rural Press Official Grange Edition, issued every week, will be found additional matter from this and other jurisdictions, of interest and importance to Patrons. Any subscriber who wishes can change free to that edition.

Come to the State Grange.

A Persuasive Call from Watsonvi le.

We are very glad to receive and publish the following noble invitation by the Worthy Overseer of the State Grange, to his native home of Watsonville. Every fourth-degree member is entitled to attendance with the privilege of speaking and offering motions, and otherwise participating on the floor of the State Grange.

It is always a great privilege to true Patrons to attend the State Grange, and this year's session seems bound to be an extraordinary occasion. Bro. Roache, we are sure, is cordially backed by many noble brothers and sisters whom it will be a pleasure to meet also.

There are great numbers of Patrons in this State who have never attended a session of the State Grange and hence do not know what a real treat they have missed. They often talk of such a "pilgrimage to Mecca," but it seems so far off, so much like taking a trip to Europe, or even to the moon, that after thinking it all over they conclude with a regretful sigh: "Well, we can't afford to go this year, anyway. We can't spare the time nor money."

Well now, Patrons! let s sit right down here and settle this question in the light of existing facts. You work early and late, winter and summer, rain or shine; you don't even take time to half read your last RURAL PRESS, and you just glance over the names of the political nominees, and five minutes after you couldn't tell who's who because you have to rush off to attend to this or that, and have no time to think of anything but your own business.

Ay! there's the rub—you have not time to think, only of your own business. That is the fatal shoal on which millions of happy farm homes have been so cruelly wrecked. What matters it that your soil is the richest, your efforts the most systematic, your labor the most unceasing, your crops the most bounteous that Nature can yield, when transportation companies, insurance companies, Chambers of Commerce, twine rings, sack rings, grain rings, money rings and universal rings of trusts and combines unite in setting a limit to your capabilities and accumulations by setting the price on all you sell or buy, and, meanwhile, make you dance to the tune of "Poor Old Slave"? While you are dancing in a whirl of mental agony, they pass around the hat and give the lie to the old adage that "those who dance must pay the fiddler." While you are planning how to raise a crop, 20 are planning how to rob you of it.

Do you really desire a panacea for these ills? There is one—sure, pure and powerful. Do you wish it? Then go to the State Grange and add your name and influence to the marching column of the grand men and women already there, who have solemnly sworn to rid our fair land of the soulless parasites who grow and flourish on the misfortunes and necessities of the toilers.

Then for real pleasure see what is offered. It is not often that a State Grange is held within the hearing of the thunder-tones of "Old Pacific," or where crested waves of snowy white and azure blue ripple soothing lullabys on shining sands and ocean shells, while a plunge in the surf is a better cure for liver complaint or a weak back than all the plasters and pills you can use in a year.

Then look at the program outside of the Grange:

A citizens' address of welcome.
An open-air concert by the band.
Complimentary rides all over the valley.
Clam-bake at the beach.
Free excursion to the greatest beet farm in the world.
A grand old-time barbecue, and several other things which we won't tell you about till you get here—all without any extra cost to you.

Now take out your book and pencil and see if you can't afford to come! The railroads have reduced their regular fare, so *that* will not be expensive. Then it won't cost much more while you stay here than at home—as observe the following accommodation rates:

Mansion House, first-class, $1 50 per day.
Lewis House, first-class, $1.50 per day.
Watsonville House, good cheap house, $1 25 per day.
Washington House, second-class, $1 50 per day.
Morning Star Hotel, $5 per week, $1 per day.
Germania Hotel, $4 per week, $1 per day.

A number of restaurants, 25 cents per meal.

Large numbers of private residences of our best people will receive Patrons at from $1 to $1 50 per day.

Camp Goodall, at the beach, $1.50 per day, and free rides from the camp to town and back, four miles each way. Ample room for all who come.

The Pajaro Valley Fair Association will hold the main part of the exhibits over for the inspection of visiting Patrons. The cost will bear no proportion to the pleasure, and remember the session itself will be of far greater profit and pleasure than anything here mentioned. No Patron can afford to *miss* this session, as the "world continues to move," and has rolled up a number of grave questions to the tillers of the soil, which must be faced and conquered.

Awake then, Patrons, awake! Arouse, and come to Watsonville to the session of the State Grange, whither duty loudly calls, where you will receive as honest a Patron's welcome as you ever have had in your lives. Do not expect to stay only a day or two, but through the whole session to the love-feast Saturday night—the best part of the session, which so many miss because of their hurry to get off. Come and stay long enough for us to get acquainted with you, that we may know and remember you, and that the bonds of sympathy and love may be made nearer and dearer, that we may all work in greater harmony, with broader charity, with a better understanding of our weaknesses and defects in order to their speedy extirpation, and that the hearts of Husbandmen and Matrons, laborers and maids, be made glad by this one grand farmers' holiday of the year.

A. P. R.

Meeting of the Legislative Committee.

In accordance with the advice of Brothers Ohleyer and Flint of the Legislative Committee of the State Grange, the committee will be convened at Watsonville on the morning of Oct. 6th to consider the bills proposed for enactment by the coming Legislature.

We look upon the work of this committee at the coming sessions of the State Grange and Legislature as likely to prove of the utmost importance, not only to Patrons and farmers of this State, but to all industrial people.

Among the legislative enactments deemed requisite are bills for the reassessment of railroad property and collection of delinquent taxes; Enabling Act for the organization of mutual fire insurance companies by farmers and others; a bill for collecting taxes semi annually and the Australian Reform Ballot law. There will also be considered an enactment for electing U. S. Senators by direct vote.

We would recommend that these bills be discussed separately, during different days of the session. There are other improvements in the laws of the State and nation which should occupy the attention of the State Grange. Will not each Past Master of the State Grange write us a communication for publication previous to the meeting of the State Grange on improvements desired in our statutes, both State and national? It is hoped that every member of the Legislative Committee will be promptly on hand. Let others send in suggestions or proposed bills.

To Tulare and Fresno Farmers.

We would call the special attention of Patrons, Alliances and farmers generally to the open conference meeting to be held at Tulare, Saturday, Sept. 20th, and Selma, the following Saturday, Sept. 27th, opening at 10 o'clock A. M. All farmers are invited.

C. J. Cressey, Treasurer of the State Grange of California (the leading founder of the Grangers' Bank) will be present and discuss subjects of interest and importance to all farmers. He is one of the most popular and attractive of Grange speakers, and it is safe to say that all will feel well paid for attending and listening to his remarks. Other able speakers will also participate. Perhaps similar meetings will be announced in the local papers and held at Visalia and Hanford, between the dates above mentioned.

A Fruit Festival will be given at Tulare and a Grange meeting held in the afternoon at both places, at each of which members should be present. Patrons are invited to make these announcements widely known and to be present.

GOING TO WATSONVILLE.—It has already been mentioned among the delegates and visitors to State Grange next month there will probably be eight or ten from Yuba City, six or more from Santa Rosa, 15 from Stockton, 10 from Merced, and an indefinite "many" from other Granges. And now comes a note from W. Sec. Hedger of North Butte, that there will probably be four or five from that Grange, and another from W. Sec. Sharal of Elen Grange, saying: "Nine members have signified their intention of attending; several others are uncertain, and may conclude to attend when the time comes." The more the merrier!

MEMBERS of Watsonville Grange desire that an open meeting of the State Grange shall occur on Tuesday evening. Why not? By all means let us have a hearty meeting with the enterprising citizens and friends of Watsonville.

DISINCORPORATED.—Sept. 10th, Judge Levy granted the petition for disincorporating the Patron Publishing Company, in accordance with the vote of the stockholders at its last annual meeting.

THE W. M.'s Desk in the RURAL—always loaded with good, beautiful and useful thoughts—is even better than usual this week, it seems to us.

The Master's Desk.

E. W. DAVIS, W. M. S. G. OF CALIFORNIA.

There is a whole lot of politics in this State just now. How much of it is honest politics? There is no disgrace in taking some interest in the welfare of your country, but there *is* disgrace, and there *ought* to be more disgrace than there is, in being *dishonest* in politics. It is high time *honest* men were loaning their name, their time, their influence to politics. Quit this sentimental business and go to work for the good of the common country. Be men; be American citizens in the fullest sense of that word! Be a politician to the extent of getting and giving the greatest good to the greatest number.

Brother Cressey takes the stump again in the interests of the grand old Grange.

Do you know that of the living Past Masters of the California State Grange all but one are actively at work for the good of the Order? What higher testimonial of fidelity and love could be shown? Those venerable seers must think the Grange is worth something.

Officers of the State Grange, attention! Have you filed your annual report with the Worthy Secretary? If not, why not? Look at the law and you will see it is time. "Act, act in the living present."

Short speeches are always the best. *Multum in parvo*—much in little—is what is wanted nowadays in all parliamentary bodies. At the coming session of the State Grange we want "to see who can best work and best agree."

Upward, onward, but hew to the Grange line.

Don't waste your time, fellow-farmers, with idle talk on the pot-house politician. The medicine he most needs is for you to vote for the "other fellow." Remember political parties only so far as they are represented on voting-day by pure, competent, honest candidates. "The chain and the link" illustration applies right here and now. Vote as you ought to vote—for the best men. No man is too good to be a public officer, but many are too bad. Select, and select with care!

Admission Day; State Grange; State and County election—three important events coming close together in 1890! And each one cuts an important figure in the welfare of our great State. Look well to your interests, fellow-Patrons! No one else will do it for you.

Are you preparing *thoughts* for the State Grange? Ideas are what we want. Never mind so much about the words. Set to studying, for the State Grange is near at hand.

Study to say a bright thought in the shortest possible way. You know a straight line is always the shortest distance between any two given points.

It is not a bad thing to burn the "midnight oil" now and then if you are seeking the true, the good and the beautiful. Many of you may say that is so even if "the true, the good and the beautiful" applies to some fair daughter of the Golden West. On this subject we will never disagree, so long as the object sought can be shown to be true, good and beautiful.

State Grange, Watsonville, October 7, 1890 Attend, and be there "on time," all the time!

If Patrons made half the campaign that politicians do, how the Order would increase in power and in numbers!

Join an Order that helps the helpless, educates the young, loves America and insists on law, order and equal rights. Such is Grange doctrine.

Who has not, now and then in life, found a pretty flower away out in the desert, or on the high, dry hillside, or in the mountain fastness, and this just when least expected? And who has not, at such time, thought more of that flower than of any one ever before found, even though the home-garden might be richly studded with Nature's choicest blossoms? So with the Grange. When we find a Grange-home away out from our richer and more densely populated agricultural sections, why not think of the "lone flower"? for such it is. This Grange breathes its perfume, lends its beauty and spends its force among those who fully appreciate the charms of the Patrons of Husbandry. And as the modest, pretty flower brings and consecrates its life to the development of a seed, which may be wafted hundreds of miles to produce plant, flower and seed for another year, so may each one of our Granges bring forth a flower and scatter seed that will brighten the plain and the mountain regions, and aid and lighten labor in all sections of our great country.

BRO. D. FLINT, it is expected, will assist at the dedication of Two Rock Grange hall on Thursday of this week, and deliver an address at the Sierra Valley Grangers' Fair, which comes off at Beckwith, October 1st to 3d.

OF Merced Grange, some 10 members expect to go to State Grange in October.

The Great Interstate Meeting.

Of the Grangers' Interstate Picnic Exhibition (held at Williams' Grove, Penn., Aug. 25th–30th, as mentioned last week) the *Farmers' Friend* says editorially:

A true description of the great meeting would seem to our readers who know nothing of its proportions like wild exaggeration. As to attendance alone, the figures must stagger belief. But there is no reason to exaggerate when 40,000 or 50,000 people gather in a single day with no other object than wholesome recreation. * * *

So much for numbers. But there is something more to consider—character. This was a peaceful assemblage, that would give no countenance to disorder. There was noise enough, to be sure, for everybody was hilarious, and every laugh was the outflow of happiness gushing in its fullness; that was all—no boisterous nor indecorous rudeness to mar the peace of summer days fashioned to suit keenest sense of enjoyment. Such was the great meeting with an environment in full adaptation to all its purposes, the trees fresh in foliage that gave reminder of June, outlying fields, with verdure or harvest, to please the eye, every influence benign.

As to the order of proceedings, is it not enough to say that every visitor was left free to seek every pleasure compatible with the good of all? Of course there was speaking, sometimes prosy, perhaps, but nobody was asked, much less pressed, to hear it. People gathered by thousands in the vast auditorium to see and hear, and as they had enough they left while other thousands filled their places. There was a surfeit of tariff and tariff reform, for both were in the air, floating with the undulations of sound from lungs that never tired. That was the fare dispensed from a platform from which went no word of command.

The Grangers' Interstate Picnic Exhibition at Williams' Grove is a permanent institution. Every true member of the Order of P. of H in the United States will stand up in its defense and see that no injury is done to this meeting, which is held for the purpose of advancing the cause of the Grange.

Bro. Whitehead, also, in the course of two columns of notes about the meeting, remarks:

You can whittle the *form* of a man out of wood, you can chisel one out of marble, you can make one out of cast iron; but you can't make a man out of it, you can't breathe the breath of life into it, you can't put a *soul* into it. Just so with any side-shows or imitations of Williams' Grove. You can't take it away, you can't put its life into the wooden image. The spirit, the life, the soul of Williams' Grove is *the Grange*. Like our Order, *Esto Perpetua*, "Let it be perpetual," and so said the tens of thousands of good Patrons and their friends who rallied this year as never before.

One of the best improvements was the inclosing of the great auditorium at the ends and sides with glass, so as not to interfere with the light, and with plenty of doors for getting in and out.

The new cottages, in their bright paint, together with all the many other improvements, added new beauties and attractions to the grove. It is now an ideal camping-ground.

The evening meetings in the auditorium were much enjoyed. Music, singing, recitations, etc., filled up the flying hours, and were a change and rest from the more heavy and solid food furnished from the platform in the day-time.

Four hundred and seven carloads of people brought to the grounds in one day by the railroads, besides those who came by teams and the 5000 to 7000 who occupied the tents and cottages for the week, are some of the figures that will tell the stay-at-homes of the immense throngs present day after day.

It was never so completely National before. The National Grange was represented by its Master, Lecturer, Secretary and Executive Committee; also by its Legislative Committee. Many State Grange officers were there.

The joint "Good of the Order" meetings of the Executive Committees of the National and several State Granges set in motion a number of good schemes for the welfare and progress of our great work.

The founders of the Order were represented by Bro. John Trimble, the Worthy Secretary of the National Grange and a member of the Legislative Committee. Thousands of Patrons were glad to meet and to greet him.

Sorry that *all* who wanted to be there could not be present. They would have enjoyed it as we all did, so just thought I would write out a few items to tell how good and how great it was. Long live Williams' Grove! Long live Bro. Thomas! Long live the Grange! *In hoc signo vinces.*

A HISTORY OF FARMERS' ORGANIZATIONS.—The St Louis *Journal of Agriculture*, which is the official organ of the Farmers' and Laborers' Union of Missouri, has lately published a volume of nearly 400 pages, embracing histories of the Farmers' Alliance, the Agricultural Wheel, the F. & L U. of Mo. and the Farmers' Mutual Benefit Association, with numerous portraits and biographical notices of their officers and organizers. The introductory chapters treat of the present condition of the

agricultural interest, of finance, transportation, monopolies and combines, and there are appended short sketches of farmers' organizations in various States, and an address on Co-operation by Phil Chew, editor of the *Journal*. The volume costs 75 cents in paper and $1.25 in cloth binding.

Co-operation in Texas.

The Texas Co-operative Association, P. of H., is a corporation chartered in July, 1878, under the laws of the State of Texas, "for the purpose of establishing and maintaining a general commission business and wholesale and retail co-operative store or stores, of buying and selling real estate and other property, as may be necessary to promote the object of its creation, and of transacting any and all kinds of business incident or appertaining hereto, for the mutual profit and benefit of its stockholders and customers, who are members of the Order of Patrons of Husbandry."

Its authorized capital stock is $100,000, divided into $5 shares.

Any co-operative association, P. of H., or subordinate Grange, as well as individual members in good standing, may become a member of this association by taking stock therein, and thus becomes entitled to *one* vote in its meetings.

The management is vested in a Board of Directors, chosen annually by the stockholders, and one of this Board's duties is to elect the General Business Manager, who must be a Patron of Husbandry in good standing. The by-laws provide that the profits of all the business transacted by the association, after paying all expenses of the management, shall be disposed of in the following manner at the annual meeting of the Board of Directors: First, shareholders shall be allowed ten per cent interest per annum on paid-up stock; secondly, a portion may be set apart, at the discretion of the Board of Directors and by consent of the association, to increase the capital. After making provisions as above, the remaining net profits shall be divided pro rata among the stockholders and Patrons, based upon the profits derived from the business furnished, shareholders receiving full dividends; Patrons, not shareholders, half-dividends. The profits arising from the business furnished by non-Patrons, and one-half of the profits on that of Patrons of Husbandry who are not shareholders, shall constitute and be known as the accumulative fund, and shall be divided annually pro rata among the stockholders, based upon the number of paid-up shares, and stock shall be issued for the same.

At the 12th annual session of the T. C. A., in Galveston, July 30–31, the Secretary, A. J. Rose, of Salado, submitted his report for the year ending June 30, 1890, showing 662 stockholders at date, and a net profit for the year of $14,797.68. He remarks: "In the 12 years' business we have increased our capital stock from $265 to $80,945, and have paid 10 per cent interest per annum on stock. The accumulative profit has averaged 6 per cent; trade profit has ranged from 1½ to 4½ per cent. In addition to these immediate financial benefits, many a 75-cent boy has received a good practical business education that enables him to get $1000 or $1500 salary, and thousands of our Order have learned business methods and business habits that they would not part with."

Bro. Whitehead's Praise of Secretary Rusk.

The Secretary of Agriculture, finding it impossible to attend the Williams' Grove meeting, August 28th, sent Manager Thomas a telegram expressing his regrets and greeting the assembly. "It is glorious," he said, "to read of such an immense concourse of agriculturists gathered together for the interchange of experiences and views and for the discussion of those problems which promote their industrial, social and political progress."

After the dispatch had been read, Bro. Mortimer Whitehead observed that the farmers of this country have no truer friend than Secretary Rusk; that in every advance move made he has proven this clearly. A farmer himself, he knows the true condition of affairs, and being a member of one of the first Granges ever organized in Wisconsin, he was fully aware of, and in full sympathy with, the conservative course of the Grange in its efforts to advance the interests of agriculture. Secretary Rusk has rendered valuable aid in securing the protection to American agriculture given in the Grange part of the Tariff bill, and in getting the new appropriation for agricultural colleges and restricting the same for education only in agriculture and the mechanic arts in accordance with the amendment proposed and secured by the Grange. Patrons and farmers may rest assured that they have a true "friend at court"—one who in his seat at the Council Board of the President will carefully look to the interests of agriculture.

TULARE GRANGE expects to confer the third and fourth degrees Sept. 20th. They will have a Fruit Festival and a jolly time. Bro. Cressey is to be with them, and that is a guarantee of fun, sense and success. While in that portion of the State, Bro. Cressey will probably also visit Selma, and perhaps several other towns and Granges. We bespeak for him big crowds and promise his hearers good thoughts.

Selma on the Alert.

A. T. Dewey—DEAR SIR AND BROTHER: At a special meeting of the Grange Saturday, Bros. H. B. Jolly, Paris, Allen and W. P. Graham were appointed a committee to wait on Bro. Cressey at this place on the 27th. There is also a committee from the Alliance to act as escort. It was also decided to have some handbills printed and a notice in our daily and weekly papers here, so I think there will be a large meeting.

The Alliance here balloted on 19 new members Saturday, and the Alliance at New Chicago, 12 miles west of here, was to initiate 20 last Saturday night. The farmers are falling into line just as fast as they can in these parts. It puts me in mind of the good old days of 1873, when we fell into line to kill Friedlander's oppression.

Our Grange here is holding its own, and we propose to stand firm. We are out of debt and have some good material in it, so we know we can hold out. I hope Bro. Cressey will give us a good shaking up, so we can start up in good shape this winter. Fraternally,

J. J. ROADHOUSE, Sec'y.

Selma, Sept. 15, '90.

MORAL CONVALESCENCE IN LOUISIANA.—The N. O. *New Delta* for Sept. 21 says: The steady growth of the anti-lottery sentiment all through the State, and particularly in the city of New Orleans, has been something wonderful. The most ardent opponents of a recharter could not ask for more evident signs that the lottery amendment will be overwhelmingly defeated, if it ever comes to a vote, than are daily being exhibited. From all sections of the State come assurances that the anti-sentiment is on the increase. At no point has the lottery gained any strength since the adjournment of the Legislature. This fact has already been recognized by the lottery leaders, and they are now engaging in a desperate attempt to stem the tide that is running so strongly against them. They are now aware of the fact that they have no easy task before them in their efforts to fasten upon Louisiana for 25 years more their iniquitous gambling concern. * * Every day evidence accumulates that Louisiana is fully able to run her own Government without the aid of the lottery company, and long before April, 1892, it will be demonstrated beyond the peradventure of a doubt that no necessity exists for the aid of money derived from gambling to run our Government. * * The eyes of the people are already opened and the lottery is doomed to defeat. The lottery's "league" was started too late.

In Memoriam.

Bennett Valley Grange buried BROTHER B. LACQUE with all the honors of the Order, on Sunday, Sept. 13th. Brother Lacque was a charter member of Bennett Valley Grange, No. 16, P. of H. An honest man, a devoted husband, a loving father, a generous neighbor, a considerate, conscientious citizen, a pure and patriotic Patron is gone. Mother Earth, that he has tilled for threescore years and more, has, after these many days, furnished a resting-place where, we hope, the grass will ever grow green, where flowers will bloom perpetually, and where children and children's children may drop the silent tear of veneration, love and devotion. Farewell, dear neighbor, friend, brother; fare thee well! E. W. D.

OUR NEW GRANGES IN THE NORTH.—We have evidences of progress in Gridley, Grimes and Orland Granges, and hope to hear of some good meetings between now and the State Grange in each place. Brother Frisbie stands ready to visit any of these and other Granges in his district at any time he may be called, if dates are so arranged that he can take them in a circuit, as it were.

TIDINGS FROM JAPAN.—A long and friendly letter from our honored brother, A. A. Brigham, formerly W. M. of Massachusetts State Grange, but for the last two years Professor of Agriculture in the imperial college at Sapporo, Japan, is just at hand and welcome. It will soon appear in the RURAL. He closes with the hearty wish—"Long life to you and the P. of H. in California."

CELERY FARMS.—Among a number of special investigations being made in the Division of Agriculture of the Census Office is that of "Truck Farming," which is distinct from market gardening in that the truck farmer raises one or more special crops in large quantities in sections where the soil and climate are particularly favorable, and the product is shipped to distant markets; whereas the market gardener, even though his operations are carried on upon a large scale, produces crops for his near-by city market. Celery is one of the specialties on a number of truck farms, and the figures already brought out are interesting. In the vicinity of Akron and Canton, Ohio, over 500 acres are devoted to celery. The Kalamazoo, Michigan, celery district comprises over 1500 acres, being cultivated by some 300 families. The celery farms as a rule run in size from one-fourth to ten acres each, but there is one of 60 acres. The crop is boxed and shipped by rail to all portions of the United States.

THE Census Office announces the population of the State of Maine to be 660,260, an increase in ten years of 11,325.

ENTOMOLOGICAL.

The Brown Apricot Scale.

Principal L. A. Jordan of the Centerville, Alameda county, public school, has set an excellent example for the emulation of other school-teachers, in aiding the people of the districts in which they work in the warfare against injurious insects. We find the following in the Irvington *Express:*

Microscopical investigation, in connection with the study of practical entomology, as provided by law, has been, this year, an interesting occupation at the Centerville public school. Thanks to the policy of the trustees, past and present, of providing the best of materials for use of teachers and pupils, the instrument used in this work is a powerful one and proportionately useful. The subject at issue this term has been the brown apricot scale. The importance of this pest may well be illustrated in the case of the resident Horticultural Commissioner, Mr. Wm. Barry, himself. The insects beset his peach trees so numerously last year that the destruction was threatened not only of this year's fruit, but of the very lives of the trees themselves. Neighbors and, in fact, orchardists far and near, had generally had poor success with remedies, either destroying trees by severity of treatment or failing to injure the insects, owing to mild applications. But Mr. Barry holds that no fruit-tree pest has yet appeared that cannot, by judicious treatment, be eradicated without injury to trees, and the brown apricot scale, even in its most resistant state, is less impervious to destroying washes than other scales now being successfully treated by skillful orchardists. Observing that the pest was about to ruin the orchard, Mr. Barry wrote, in October, 1889, to State Inspector Klee, stationed at the University of California at Berkeley, in this county, and in November received the following recipe with appropriate advice: ¾ lb. caustic soda, ¼ lb. caustic potash, 4 gals. water.

The proof that this pest can be easily eradicated is shown in the results of the application of the above wash and its variations. The further proof that many failures are due to unskillfulness has also been shown in this case, and, furthermore, that the application is comparatively inexpensive.

There are a few details, the attention to or neglect of which bring good or evil results. The recipes and cautions in this case are invaluable. Successfully followed, thousands of dollars will be saved, not only by orchardists of this county, but of other communities, thanks to a widespread press. Through the enterprise and public spirit of Mr. Barry and the *Express*, supplemented by the progressive work in the public school, we are able, herewith, to give to the public the essential features of a successful effort in the case discussed, fully three-fourths of the scale having been destroyed without injury to trees, and with the prospect for complete eradication this year.

Recipes.—No. 1 (from State Expert Klee), ¾ lb. caustic soda, ¼ lb. caustic potash, 4 gals. water. No. 2 (variation by Mr. Barry), ½ lb. caustic soda, ½ lb. caustic potash, 4 gals. water. No. 3, and the best (also variation by Mr. Barry), ⅔ lb. caustic soda, ⅓ lb. caustic potash, 4 gals. water.

The main ingredient, according to Mr. Barry, is the caustic soda, the working agent. Like the sting of a bee, it is immediate, penetrating, sharp. When properly applied, no scale has yet appeared that can resist it. The caustic potash is added to keep the soda liquidescent and to prolong its efficacy, the proportion to be regulated by the weather. On dry days—days of hot sun—a deficiency of potash causes the wash to change to a white powder quickly after application, thereby losing its strength. This being observed, the change of proportions can be at once made. If the effect be fatal to the insect, it will be shown in 24 hours by a shriveling of the scale and darkening of the color.

Caution 1.—Neither wash nor labor should be spared. The greatest mistake made by those who have failed is in having attempted to do too much within a given time.

Caution 2.—Visit, first, that part of the orchard least affected, so as to give the experimenters practice before reaching the worst.

Caution 3.—As the scale is deposited in October, commence spraying in November, as soon as the leaves drop, or even just before, as many live insects may be caught before encasing themselves; and again the scales already formed will be the easier penetrated.

Caution 4.—Spray once during fair days of winter and again in March and April, just before the buds start. After April, spring growth will prevent. Now prune all the limbs not bearing fruit-buds, destroying many newly hatched insects and securing a new growth exempt from the enemy.

Caution 5.—Be sure of the strength of the caustic soda. Use the green-bank brand from St. Helen's, England, 98 per cent strong, recommended by Prof. E. W. Hilgard of the University of California, obtainable through Jackson & Co., San Francisco.

Caution 6. — Spray adjoining orchards, whether apparently unaffected or not, as prevention is easier than cure. Although the pest is termed the apricot scale, Mr. Barry's apricot orchard seemed to be exempt, the peaches alone suffering. However, the former was just as carefully sprayed. Buyers and neighbors have remarked the superior cleanliness and brightness of the fruit of these orchards this year over that of the past.

The remedies given above are for all scales on all deciduous trees—too caustic, however, for evergreens, destroying the leaves. Whale-oil remedies should be applied to the latter.

The damage to deciduous trees by some washes has been due to too great strength of the liquids. But in the case we have cited (trees three to ten years old), but three fruit-buds were found injured, and the trees not at all.

Cost.—Four thousand gallons were used by Mr. Barry on eight acres, at a cost of $80 for chemicals. The best kinds and cost of spraying apparatus will be presented at another time, together with a plan by which very small orchardists may have the benefit of same economically.

It is to be hoped that the school management will be able to keep up communication with the progressive fruit-growers of the district and the State expert and authorities. At least 85 per cent of the pupils of this particular school came from Portuguese families, where English is neither read nor spoken. Most of the parents, however, have fruit-trees, and might unwittingly baffle all attempts to clear the district of pests through non-communication; might maintain veritable breeding-places for pests. But the pupils are bright; many of them in the higher grades. All the pupils are invited by the principal to bring specimens of diseased parts, or of pests of any kind, to be identified by microscope, and to take information like the above to be translated to eager inquirers, no doubt, at home.

A Day at Oakland Fair.

The Golden Gate Fair for 1890 was held at the Oakland track, near Shell Mound station, Sept. 1st to 9th.

On the morning of the 5th one of the RURAL staff made his way to the fair grounds, was courteously received by Secretary Dimond and Director Latham, and spent some time in viewing the live stock and watching the flyers.

Between 10 and 11 o'clock the Marshal donned his three-hued sash and began assigning the horses and cattle their places in the stock parade. The display of blooded horses was said by those who should know, to outshine previous years. There were lithe, satiny runners and clean-limbed trotters in great number, strong and speedy roadsters, handsome and spirited carriage teams, elegant, many-paced saddle-horses and powerful, majestic Percherons.

Then the herds—a grand procession—Younger's Durhams at the head, followed by Geo. Bament's Ayrshires, F. H. Burke's Holsteins and Thos. Ward's Jerseys, with a single Polled Angus heifer bringing up the rear. Some fine Jerseys were also exhibited by P. C. Anderson and E. C. Sessions of East Oakland, two Herefords by Geo. Bement, and an Alderney bull by S. A. Haxby of Alameda.

At the stables our attention was drawn particularly to six beautiful Percherons of various ages and colors, imported from France last year by J. C. Smith of Oakland. There were two three-year old stallions, one black, the other iron gray; two gray mares of seven and four years, and two fine colts.

At the pig-pens we found some Essex swine exhibited by Bement & Son, and a goodly delegation of Andrew Smith's Poland-Chinas and Berkshires, including his famous champion boar "Model Duke," well known by portrait and description to many of our readers. Mr. Smith also showed 15 or 20 of his fine Shropshire sheep.

The coops sheltered a large assortment of poultry, by P. L. Earhart, including Bronze turkeys, Toulouse geese, Pekin, Rouen and Aylesbury ducks, and fowls of eight or ten popular varieties; while Leslie McKillican made a good showing of carrier and fancy pigeons, besides Game, Seabright, Plymouth Rock and other chickens.

After lunch, the grand stand filled up with spectators, and the inclosure opposite the judges' stand was packed with vehicles in view of the expected running events. The writer took a position near the wire, and, albeit he "don't go much" on races, found the excitement catching as (in the six-furlong gallop) Mystery came flying down the home-stretch so far in advance of her competitors that Murphy, looking backward, saw *he* need not whip to win; and again (in the 1 1-16 mile dash) when, after the half-dozen contestants had swept halfway round the course, all in a bunch, the "dark horse," Hotspur, leaped ahead of all his rivals and shot past the goal victorious, with the capless, tow-headed little jockey all but flying himself.

It was an interesting and instructive day; but we long for the time when the pool-selling and the "wheel of fortune" shall be banished forever and forever from the fair fields they still disgrace.

CANS GONE UP.—Eastern canners are concerned because of a rise in the price of tin cans. The price has been advanced 18 cents per dozen, in three-pound sizes, since the season opened. The cost of canning has been increased thereby. Packers who have not secured their stock of cans are at a decided disadvantage.

Baby's Picture.

[Written for the RURAL PRESS by J. E. TOTHEROH.]

So you've looked all though the album and can't find his pictur' there?
Well, of course not—in that partic'lar I didn't treat the babe quite fair,
For I kep' puttin' it off, an' puttin' it off, and waitin' day arter day,
A-watchin' his curls grow longer, and studyin' the cutest way
To have his pictur' taken—some new an' orig'nal kind—
For a little angel's pictur' seemed most like him, in *my* mind.

But our kind and all-wise Shepherd takes wonderful care of His flock,
An' sometimes when the sheep are all sleepin' He comes an' undoes the lock
Of the sheepfold, takes one of the lambs in His bosom and gently goes His way,
For He knows that the sheep will all follow and will never go far astray.
So one day the Lord sent His angels and took back the child He gave.
For He seemed to know my salvation would be found by my little boy's grave.

So I haven't got his pictur'—that is, not the album kind—
But I've got a more lastin' likeness a-written on my mind;
Every evenin' when all is quiet I sit in my old arm-chair,
An' then I can see my baby's eyes and his curly, golden hair;
I can see his innocent, smiling lips and the dimple in his cheek,
An' (what's more than's in any pictur') I can hear the darlin' speak.

I s'pose you think I'm imaginin' a great deal more than I see—
But there's one thing sure, and that is, my boy is a-beck'nin' to me;
An' no matter how wild the night is, nor how loud the winds may roar,
I can hear my darlin' callin' as he stands on the other shore:
"Come over to me, dear papa, the winds do not blow on this side!"
An' that is the talkin' pictur' I have of my boy that died.

Konocti.

[Written for the RURAL PRESS by LEPA.]

Probably no county in the State of California is more remarkable for the number of its mountains, the loveliness of its valleys, the richness of its mines, the extent of its timber and persistent presence of shrubby growth—redbud, greasewood, dwarf oak and manzanita—for the number and variety of its springs, from pure and clear in quality through many grades of mineral combinations to sulphurous, and the beauty and proportionately great expanse of its lakes, than Lake county, the resort of the lumberman, the miner, the tourist and the gambler, all associating peaceably and safely with the farmer and the Digger Indian; though, in the case of the Indian, this peaceable safety was not secured without compulsion. There, as in other less or more beautiful places, submission came because one said and acted to the other,

* * * "You must fall,
For I am great and you are small.

This was the Indian's country. Borax lake spread its soft waters for him. Clear lake nursed the baby fishes to supply his hunger, and the Blue lakes sparkled and dimpled at sight of only his dark face by their shores, while the pine-nut gathered its resinous spiciness and the acorn its bitter strength as gifts to him.

But the white man came as he goes everywhere. He brought his family and spaded, plowed and planted. Sometimes he had no family and took a companion from among the red women, to send her into the wilderness years afterward, as Hagar was sent, when a white mate could be obtained.

Ill feeling grew between them and a settler, the father was killed and his sons defied; military help was called for and soldiers sent under command of Gen. Vallejo. They arrived at the base of the highest mountain to be found in that vicinity, the one that sits always with its robe dabbling in the waters of Clear lake, and slowly, wearily they crept up its bushy, rocky side, dragging a cannon or two with them.

They reached the summit, fired a few shots, frightening the natives, who had never before heard such guns, and then, like the other famous men who marched up the hill, "they marched down again," because they could not stay. Even this huge pile of earth and rock seemed silently to resent their presence and sent forth no clear stream to sing a welcome, no cataract to proclaim its refreshing presence, not even a passive, sleeping spring to flash back the gleam of sword and gun. They disarmed the Indians and went away, and in honor of this soldierly achievement the mountain has since been called Uncle Sam. But the Diggers had long before given it a different name, Konocti, which still clings to the boat-landing near by on the reedy shore where the red people lived in scattered villages in order to be near the source of their fish supply. In the hay or harvest field they attract little attention, seeming to be neither one race nor the other, but among the hops one gets a glimpse of the still, unsmiling brown babies watching the older children and the mothers pulling the fragrant hop blossoms from the vines and tossing them into the odd-looking baskets to be taken to the machine, where they will be crowded, crowded till they lose their free grace of form and become simply a pressed mass. Do they think, these silent men, or do they only remember?

When "the waters covered the face of the earth," ridges that now seem to have lifted themselves from their oozy bed and woven a covering suited to the upper world must have been beneath the surface; then Borax, Clear and the Blue lakes must have been one, with Big valley still the fishes' swimming-pond, and the whole claimed and possessed by the red man.

If you can gain the confidence of this same red man, he may tell you that once, "moons and moons ago, all the Indians in the world were bad—heap bad. Great Spirit, same you call God, say 'Indian no good any more—kill 'em.'"

Then the Great Spirit shook Himself and the mountains shivered and crept together. He raised His head, and the eagle feathers filled half the sky; the war paint on His face was so bright all the air turned red; He threw His blanket over the earth, and all was darkness except where His arrows shot themselves when He commanded them. Then the Indians died and died till nearly all were gone.

"By and by," this strange man says, "Great Spirit heap sorry. He find one, one, one, one" (holding up his fingers and counting them) "good Indian. He take good Indian in big net, big blanket, and hold it up, then He cry—cry like squaw, water run, no can catch it, up, up, all over, no can see dead Indian. By-and-by He set good Indian down on mountain, kill deer, make fire, say 'Live now;' then no cry any more—all good, long time all good. By-and-by pappoose, more pappoose, heap Indian again; more Indian come, shoot deer, catch pine-nut, catch acorn."

So these divisions of the same race had treated each other as another people were to treat them. Must this always seem to be according to the law of Nature?

They were crowded and complained, called on the Great Spirit for relief, and the most mighty among the spiritual messengers was sent to quiet their murmurings. This angel was like the one we hear of as Lucifer, fallen, but still powerful. He listened, turned toward the mountain and vanished, but the rocky doorway through which he entered is yet there. As he disappeared, a sound

Louder than a thousand thunders
Echoed over hill and valley,
And in foamy waves, the waters,
Swirling, rushing, withdrew backward
Till but half their bed was covered;
Where the hills were rent asunder
Flowed a dancing, singing river,
And the Indian prayed no longer;
Thus was formed the Cache Creek canyon,
Thus was drained the fertile valley.

And thenceforth that silent mountain was "Konocti," "Devils' Dwelling."

Between Two Fires.

[Written for the RURAL PRESS by ASENATH C. COOLIDGE.]

"Oh! how I hate these horrid old women's rights women," thundered Tax-collector Dufferin Jones, throwing his hat on the dining-room sideboard instead of hanging it up on the hall rack. "They're always scolding about paying their miserable little taxes and about not being represented. I never saw such a stingy, chattering old lot."

His wife seemed to be in a brownstudy all during dinner-time.

"What is she thinking about?" inquired Jones pleasantly, after he had allayed his irritation with a good dinner. "The ways and means of getting a new fall bonnet?"

"No, Daffy," replied Mrs. Jones; "I was trying to think what it was Edmund Burke said about John Hampden."

"It's too deep for her. Isn't it?" said Jones.

"Oh! I remember the gist of it, Daffy. Old Burke stood up for old Hampden because old Hampden bolted on paying a 'miserable little tax' of twenty shillings and chattered about not being represented; but then old Burke was a horrid men's rights man, you know, dear old Daffy, and old Hampden was another."

Dufferin Jones plunged into the hall and then into the sitting-room and then into the hall again, and then he clapped his hands to his head.

"Is it his new fall hat he's looking for, dear Daffy?" inquired Mrs. Jones sweetly. "Here it is right side up in this plate of salad oil and mustard."

VISITOR (in court-room): What crime was committed by the prisoner who was just convicted? "He stole a ride on a railroad." "And the man who got free?" "He stole the railroad."—*Life.*

Golden Gate Park.

[Written for the RURAL PRESS by M. M. S. P.]

One of the most charming of pleasure resorts in San Francisco is Golden Gate Park. Foot by foot this beautiful park has been reclaimed from the shifting sands. Not many years ago it was a barren waste, and it is no wonder that the project of turning it into a pleasure resort met with so much opposition.

I have been informed that the Park Commissioners sent to Germany for the seeds of the German yellow lupine and scattered it broadcast in order to secure among its abundant and tenacious roots a safe resting-place for the new roots and seeds they wished to place in the soil.

These wide-spreading roots have bound together the once shifting sands into a firm, abiding soil. Its duty done, the humble little flower, at first productive of so much good, has spread all over the suburbs of San Francisco—forgotten or despised as a troublesome weed.

Everywhere in the park, up and down the different avenues, winding through the narrow foot-paths, everywhere grow rare and beautiful flowers and trees.

A great deal of fine ribbon or carpet gardening is done, and one is often greeted by the familiar faces of some sweet old-fashioned flower (such as grew in our grandmothers' gardens. I had not seen the Canterbury Bell for years till I found it there.

Trees from all countries grow here, and in some places the thick shrubbery makes it truly hard to believe that everything here has been planted. It seems almost impossible.

The roads are well kept and the grass is soft, green Kentucky bluegrass. It is a wonder how they keep it alive, for there is only the injunction, "Please keep off the *margin* of the grass," to check pedestrians.

It is said to be the only park in the United States where children are allowed to play on the grass. It would do the heart good to see the little housed-up, city-starved babies roll about on it. Still it must be very hard to keep it always in its immaculate condition with such treatment.

It would take one many days to exhaust the beauties of this immense park covering 1000 acres, and more than *one* day to *see* it all.

There are the conservatories and the aviaries for the lovers of flowers and birds. Near the aviary stands erect a section of the mammoth tree from the famous grove. The deer park or inclosure contains several large bucks and does and a pair of immense elks with a fawn. One queer animal within the inclosure greatly resembles the South American llama of our geographies.

An old lady told me one day in a street-car that she saw a splendid mirage out there. As she pronounced the word just as it is spelt, it took me too long to collect my wits to find out in what part of the park she saw this interesting sight. By the time I fairly realized what the good old soul meant, the car stopped for her to get off. I did not find the place myself even after inquiring on the grounds.

The old music-stand is now only used for an open arbor, and the new one, built in the shape of an immense shell, is situated nearer the children's quarters. The shell is most artistically painted to represent the beautiful tintings of a sea-shell, and is an excellent conductor of sound.

On Saturdays and Sundays a band of 36 trained musicians in uniform give an exceptionally fine open-air concert of popular and classical airs. The cable-car companies defray all the expense of this because it brings such an increase of patronage to their lines. Seats are provided for hundreds of people, and hundreds more drive in and sit in their carriages during the concert.

Great crowds throng the place, especially on the before-mentioned days. Every one goes to the Park, and a student of human nature will find the time pass all too quickly.

Facing the music-stand is a fine monument with life-size statue of Francis Scot Key sitting in an attitude of attention. Occasionally, the band plays the music to his inspiring verses—"The Star-Spangled Banner"—and there in letters of gold are inscribed the words.

Passing on to the right, the crowd moves toward the children's quarters. Erected within the last few years by the generous donation of one who had the real good of children at heart, there seems nothing wanting for the outdoor sport of little ones.

The building, of substantial stone, comprises parlor, waiting-room and restaurant, where wholesome lunches are served by courteous waiters, who, however, have no time to bestow on those unattended by children. The building is surrounded by broad balconies well provided with seats where one may watch the sports going on below.

There are dozens of swings and good strong "teeters," or spring-boards, with boxes of clean white sand for the little ones to get into if they choose.

To the left the ground is laid off into a sort of track, and here are kept small burros and strong goats to drive or ride around the track. The little goat-carts are dear little things, and crowds of children surround the place eager to ride. One ride around is five cents, and very few children are satisfied with that one ride.

Careful, steady boys are in attendance to run beside the small rider and see that he comes to no harm. Ten goat carriages are provided, seven burros with both kinds of saddles, and one little wagonette capable of holding six small children.

For the benefit of those who come out on the street-cars with little babies, there are baby carriages to rent at ten cents an hour, or two bits a day.

Various kinds of gymnastic apparatus are put up about the grounds for the benefit of the little folks.

Oh! the children are well provided with pleasure here!

Just facing the children's pavilion is a merry-go-round which has a circumference of 190 feet. It has 36 horses and a dozen boats, which have a rocking motion apart from the circular motion of the platform. The motive-power is in an engine a few feet from the platform. It was patented by a Mr. Walker, who still superintends it. It cost this gentleman $5000, but paid for itself at five cents a ride inside of a year. Since then he has given a bill of sale for one-half to the Park Commissioners, who pay half the expenses and get half the profits.

In the center of the merry-go-round is a cylinder piano four feet high run by the smallest Corliss engine in the world. This piano plays while the platform whirls around carrying the rocking boats and horses laden with happy, laughing children.

The parents or nurses sit about watching and enjoying the fun, too. Who could fail to appreciate the advantages for pleasure offered here? The poor may have a great deal of sport, even if they have not the nickels to spend. Truly this is a children's paradise.

Drinking a Farm.

My homeless friend with the chromatic nose, while you are stirring up the sugar in the ten-cent glass of gin, let me give you a fact to wash down with it.

You say you have longed for years for the free, independent life of the farmer, but have never been able to get enough money together to buy a farm. But this is just where you are mistaken. For several years you have been drinking a good improved farm at the rate of 100 square feet at a gulp. If you doubt this statement, figure it out yourself.

An acre of land contains 43 560 square feet. Estimating for convenience the land at $43 56 per acre, you will see that it brings the land to just one mill per square foot, one cent for ten square feet. Now pour down the fiery dose and imagine you are swallowing a strawberry patch. Call in five of your friends and have them help you gulp down the 500-foot garden. Get on a prolonged spree some day and see how long a time it requires to swallow a pasture large enough to feed a cow. Put down that glass of gin; there's dirt in it—100 feet of good, rich dirt, worth $43 56 per acre.—*Burdette.*

Chautauqua Time.

Oct. 1st is the time to begin the C. L. S. C. reading. Each day of delay beyond that time is being just so much behind. It is always a pity to be late about anything, especially as good a thing as the Chautauqua work, and the secretary urges upon all Chautauqua students, present or prospective, to take time by the forelock, send promptly for the books and the magazine and begin on time. The *Chautauquan* is now in the front rank of the magazines. Many are taking it who are not Chautauquans because they cannot afford to be without such a fine periodical. Dr. Flood has a way of securing the very finest scholars and writers in the country as contributors to the *Chautauquan*, and year by year its departments have been increased and its general style improved till there is very little criticism to be made on the work of the editor or the publisher. One of the best things for a loyal Chautauquan to do is to show the magazine to friends and neighbors who know what are the requirements for a first-class magazine. It is the very best of campaign documents.

GOT LICKED ONCE.—It was the city editor's room. One of the reporters stammered so that he had to write out an order for a beer—when he wanted one. A stammerer came in, walked over to the man's desk and began talking to him. Stammerer No. 1 said nothing, but nodded, shook his head, shrugged his shoulders and gesticulated until No. 2 turned away and got his information from some one else. When he left, one of the reporters said: "Jim, what in thunder is the matter with you, sitting there like a dummy when a man comes in to ask about something?" "I—I go—got li—li—lil—licked fe—for taw—awking ter—te a—ste—ter—ammering me—me—mun—man once."—*Ex.*

ANCIENT HISTORY VIEWS FROM A CAR WINDOW.—A railroad in Asia Minor runs from Soutari to Ismidt, and will soon be finished 20 miles farther. This road is to be extended into India and will be the grand transdivisional line between Europe and Asia. It passes near the tomb of Hannibal. Nicomedia is a way-station, and from the car windows the ruined walls of Nicea are in view, where the first Christian council settled the creed. It crosses streams on repaired bridges that were built by Justinian, and altogether has a right of way through more ancient history than any other road on earth.

Had Been at Bologna.

A Paris sausage-vender called his cry,
"Here's nice Bologna!" to the passers-by.
At that a joker, shouting loudly, said:
"Don't touch or eat them; if you do, you're dead.
I've seen them stuffed at old Bologne, and know
They're made of donkey-meat from top to toe."

Like things exploded by strong dynamite,
The would-be buyers scatter left and right.
The wild wag laughed, while in a half-hurt tone
The seller asked: "You've been, then, to Bologne?"
"I have." "That's strange, for 'f what you say is true,
You should have been returned as sausage, too!"

—*Frank Leslie's Budget.*

Chaff.

THERE is no such thing as jealousy in nature. Even the cross-roads become pleasant when the beautiful trees put them in the shade.—*Puck.*

WEEPING WIDOW—And so poor John is dead? He went out to New Mexico hoping that the high elevation would do his lungs good. And didn't he get the high elevation he expected? Western Friend—(breaking the news gently)—Well, mum, they hung him sixteen feet high—enough for any one, I guess.—*Lawrence American.*

"IT'S pretty tough luck," complained the big trunk, "to find yourself completely strapped just when you're starting off on a long journey!"—*Boot and Shoe Recorder.*

"I HAVE no grudge against fat people," said the steamboat agent, "but I always give them a wide berth if I can."

THERE are no agnostics among the college graduates. Lack of positive knowledge comes later.—*Boston Transcript.*

IF you succeed, you are a genius; if you do not, you are a fool. This is the long and short of it.—*Atchison Globe.*

AN echo is a kind of holler mockery.—*Binghamton Republican.*

"CONFOUND it! Why, that doctor is a regular pelican!" "Pelican? What do you mean?" "Look at the size of his bill!"

TRAMP (to farmer's wife, standing on the porch and looking up at the sky)—How's the weather this morning, ma'am? F. W. (turning suddenly and catching up a pail of suds)—Clear! And the tramp clears.—*Burlington Free Press.*

ON my way to Freewater the other day I saw a notice posted on a fence-corner, which perhaps expressed the exact sentiments of a majority of the people. It read: "A special meeting for the perpuss of voten a tacks will be hell."—*East Oregonian.*

BOY (to his friend who has fallen in a hole): I say, Tommy, if you shouldn't ever come out of there alive, can I have your bull pup?—*Birmingham Post.*

"THIS is a hard set," as the hen said when she was trying to hatch a porcelain egg.—*Boston Commercial Bulletin.*

"DID your daughters marry well, Mrs. Goodsense?" asked a visitor. "Lucy didn't do so badly, but Clara has disgraced us." "Whom did she marry?" "Lucy's husband is a street-car driver, but Clara married an Italian count."—*Norristown Herald.*

SPONGES have been very naturally put on the free list by tariff tinkers. The dead beats will naturally follow.—*Picayune.*

THE wise employe always laughs promptly when the proprietor makes a joke.—*Somerville Journal.*

MECHANICS WHO READ.—An employer once requested his foreman to go round among the men in the shop and advise them to make up a club to take several mechanical papers. The men did so, and when the papers came and had been read, the dinner talk of the men took a new turn. The articles in the several papers were discussed, and as a consequence a new zest was given to their work. They took more interest in it. They thought and talked about it, and studied it. Those men soon became better mechanics, and it is from such persons that foremen and shop-owners and successful men are graduated. A mechanic must be a constant reader and student if he would become a man of mark in his calling.

MOSQUITOES HATE OIL—"Wherever you find petroleum you won't find mosquitoes," said an old oil-country man. "The insects can't stand the smell of the grease, and wherever oil wells are plenty there is no call for mosquito-bars. Over and over again I've seen mosquitoes cleared out in a new oil-field as soon as a well flows. Whether petroleum, applied to the hands and face, will drive off mosquitoes I don't know, but one of the few compensations of the driller is that he is seldom troubled with mosquitoes."

GO TO BED AT NIGHT TO SLEEP, not to think over the troubles of to-day nor the anticipated trials of to-morrow. One woman said: "I plan my next day's work each night after retiring." Poor, little, nervous thing; she looked it.

THE LATEST ADULTERATION.—Cinnamon is said to be adulterated with old cigar-boxes ground up into dust.

YOUNG FOLKS' COLUMN.

The Indian Grave.

Alice was in the most secluded corner of the north orchard, snuggled down in the grass, with a United States history open in her lap, both her white elbows on it, her face bowed meditatively into her hands, and her forehead drawn together into great lines, thinking deeply, you may be sure!

Walcott found her there long before the lines were ready to smooth themselves out again, and nestled down at her feet, with his head against her lap, quite content with her silence.

Alice was two years older than he, and his oracle. Then he had great patience. Oracles always spoke; only give them time enough—he was sure of that. Trusting little brother! And this one spoke at last.

"The book says: 'When any warrior died, they buried his weapons with his body,'" and she put her finger on the place.

"Yes," he answered, not understanding in the least what she was coming to, but certain that he should before she ended.

"And you know the Indian grave we found off in the woods?"

"Yes."

"It must be full of treasures." And again he assented.

She reached down and took his hand in her own warm one, and said quite earnestly and impressively:

"Last night, when they thought I was asleep, I heard grandfather say that he must have a hundred dollars next week, and he did not know where in the world it was coming from; and his voice sounded tired as he said it. Walcott, if there are weapons in that grave, they must be worth dollars and dollars, and—"

Walcott gave her hand an appreciative hug.

"And O Alice!" he went on breathlessly, "we could dig 'em out, and nobody know, and sell 'em, and keep it a great secret, and give him the hundred dollars just when he was in expair, and be so glad."

He paused. His excess of English quite overpowered him, as it used to Alfred Jingle.

"That is just what I had been thinking of."

"Oh, could we?" And they looked at each other with round, happy eyes.

Then they made their little plans.

"How long ago did the Indians live here?" Alice asked at supper, and then blushed for fear so simple a question might betray all their mighty musings.

"I knew one Indian when I was a boy," answered the old man, "sixty years ago, who lived only a mile from here. He was a real hero among us boys; for he made famous bows and arrows and showed us how to use them."

The two children would not have looked at each other then for every identical penny of the coveted $100; but Walcott pulled her dress slyly under the table and asked for "a little more bread, please," to hide his smile.

The evening seemed never to come. It stayed away with a persistent meanness that was quite unparalleled in the history of nights and days. Alice thought of polar days six months long and wondered if one had strayed down to the temperate zone by mistake. But, loiter as it would, it had to come at last.

The night! The great moon-lighted night that was better than day! It came at last.

And with it quietness came over all the house and sleep to the weary, hard-working grandparents.

Then Alice crept softly out of bed and went to Walcott's room, helped him dress, and they crept down the old stairs hand in hand, holding their breath as they went across the cool, bare floor, where the high clock ticked noisily, and a regular breathing came from the open sleeping-room door.

Dear little feet! God bless them! Many a good deed have they done to help lighten the sorrow of the world and beautify life, but never with a truer, holier wish to minister to others than on that summer night when they tiptoed across the bare, old-fashioned room, shoeless and still, to find the Indian grave. Outside the door, which they had some difficulty in opening quietly enough, they put on their shoes and ran along the pasture-road with some little spades and a huge basket, intent on getting home before morning.

It was almost a mile away, and they had never before been out alone at night. The very silence had something strange in it, and the shadows that shimmered through the trees took on weird shapes; but they clasped each others' hands tightly and kept on. The little helpers determined to let nothing turn them back.

The mound was easily reached, and they set to work with a will, digging with their spades; and Walcott used his hands in his great zeal. At last they paused to survey their work, thought it must be almost morning, and pronounced what they had done "immense."

They really were getting down where it smelled moldy and queer, and began to be uncanny. Alice's spade grated on something hard.

"Here they are!" shouted she. Just then they heard a low, strange sound under Walcott's very hands.

They both turned white and stared at each other tremblingly.

Then it grew still again. "We must work! Think of all the dollars!" whispered Alice, urgingly; and again they commenced digging, yet with unabated fear. The wind stirring the trees above them would send them into a cold perspiration, but love made them heroic.

"There'll be chains, and wampum, too," encouraged Alice, again hitting something hard.

Then there came a great buzz and whirr, a rushing sound that seemed to fill the whole woods, and something living darted angrily past them from the very ground under their feet.

"It's the Indian's ghost!" shrieked Walcott, putting his hands over his ears. They looked into each other's horrified eyes for a minute.

"Let's run," gasped Alice, and, clasping each other's hands, they started for home in absolute terror.

Grandfather was awakened from a dreamless sleep by hasty feet, a slamming door and cries of help.

He got confusedly up in bed, to be grasped about the neck by Alice, who begged him to save them and wept beyond all control, while Walcott clung to her.

"Why should the Indian care, when I wanted them for you?" she urged at last.

Grandfather, in spite of the wisdom of experience and years, could not say anything to the purpose without a great deal of explaining on their part.

Some slow tears rose to his own eyes as he understood all the wish of the helpful little hearts, and he kissed them very tenderly as at last he found them calm enough to lie down.

"Better than gold!" was what he kept saying in his soul, as he watched them while they slept. "Love like this is better than gold!"

And that was what he said to comfort the children next day, when he had investigated a little spot in the woods. He took them in his dear old arms and explained that the grave was only a fallen tree-trunk, well mossed and grassed over and the home of some little ground squirrels. "But," said he, as he saw their disappointed faces, "your love is better to me than gold."—*L. Brown in Christian Register.*

GOOD HEALTH

THE INJURIOUS EFFECTS OF RAILWAY WHISTLES UPON THE HEARING.—An eminent Glasgow aural surgeon, Dr. Thomas Barr, has communicated to the British Medical Association some valuable data concerning the injurious effects of railway whistles upon the hearing. In railway whistles the arrangement for regulating the pressure of steam passing through from the boiler to the whistle is not usually sufficiently delicate. If the boiler should be under high pressure, the whistle is very much louder and shriller than when it is under low pressure; so that when a passenger train is leaving a station for a long run, and having therefore its boiler under high pressure, the whistle is unnecessarily loud and shrill, just when those qualities are least required. Dr. Barr urges upon the attention of the association the adoption of lower pitched whistles, with proper regulators, so as to lessen the present jarring of sensitive ears and nerves. The question of whether a whistle of lower pitch than that usually employed would be as efficient as an acoustic signal is said to have been solved by the introduction on a Scotch railway of a new form of whistle, very much resembling an organ pipe. The steam is forced on the lower edge of a brass tube closed at the upper end, and the sonorous impulses are taken up by the current of air in the tube and immensely reinforced, the pitch depending upon the length of the tube as well as upon the force of the blast. The sound resembles very much a steamboat whistle, being loud and much lower in pitch, and, therefore, less painful to the ear than the ordinary railway whistle.

HEAT AND THE GROWTH OF THE HAIR.—It is generally understood that the hair and nails grow faster in hot weather than in cold, but perhaps few are aware that any temperature can impart so great a stimulus to the growth as Colonel Pejevalsky, the Russian traveler, says the Central Asian heat did during his journey in those regions during the summer of 1889. In June the ground and the air became excessively hot, so great, indeed, as to render travel in the daytime impossible. Within a fortnight after this oppressive weather began it was noticed that the hair and beards of all the party were growing with astonishing rapidity, and, strangest of all, some youthful Cossacks, whose faces were perfectly smooth, developed respectable beards within the short period of 20 days.

A WISE PRECAUTION.—A firm of chemists in Birmingham, Eng., placed upon all poisons sold by them directions as to the antidote which should be applied in case where the poisons are taken accidentally or intentionally by human beings. An English chemical journal gives an instance where this precaution was the means of saving life. A woman poisoned herself and then informed her husband that "she had done it." A medical man was at once sent for, but in all probability the woman would have been dead before he arrived but for the fact that her husband chanced to read on the label which accompanied the poison the instructions: "Give a mixture of chalk and water, milk and magnesia or carbonate of soda and water until medical aid can be procured." The result is that the would-be suicide is alive to-day.

DOMESTIC ECONOMY

A Way Out.

"The difficulty is," said a worried little housekeeper the other day, "that it is really a matter of dishes. I mean that if you plan a lighter meal for a summer day, you can't make it look pretentious enough to satisfy the boys, or, for that matter, their father either. Don't you see what an important part the platter plays? The vegetables are all in subordinate dishes, and there is instant suspicion, when a masculine member of the family sees a vegetable-dish in the place of honor, that he is about to be defrauded. If I only knew how to spread them out—but I don't, and so I have to provide the everlasting steak or roast."

"But why don't you dress one of the vegetables to take the place of meat?"

"How can you? It must be boiled somehow, or mashed, or some of the things that reduce its bulk. Things would be lost on platters."

"Not if you surround them with sauces. You have been abroad. Don't you remember the great platters of macaroni with tomato sauce, a mighty mound that came on as a separate course, and that disappeared before the *pension* appetite faster than it could be served?"

"But that was Italy. We eat things there in a fashion no American dreams of."

"So much the worse for the American, then. Every doctor announces that we eat far too much meat, every new medical book has its word about the diseases induced by too much meat, yet we go on filling our boys and girls with it three times a day, and laying a foundation of over-stimulated nerves for the doctor to patch by-and-by. Meat has its place, but once a day is enough for anybody but a hod-carrier, and with our boundless supply of fruits and vegetables and grains, one need never miss it. It is easier for a poor cook to dump a steak into a pan, and leave it there till it is wanted, than to prepare some substitute, and I dare say your own brain may be called upon to fill the gap, but you may still have your big platter."

"Three hearty boys and a critical father," murmured the little mother.

"The heartier the better. I happen to know that you have taught them to eat everything, with no prejudices. Now I shall tell you of a vegetable cutlet which I ate in a London vegetarian restaurant, and which deserves introduction everywhere. To carry out the illusion, you may save the delicate bones of some French chops, and stick one in each. Serve them with a sauce of any kind you like, from tomato to one made of the remains of gravy with a little chopped pickle. Do as I tell you, exactly, and let me know the result."

A week later the little woman entered triumphant.

"I have conquered," she cried. "The boys howl for more, and even Arthur has not a word to say. Now tell me some more."

That was the beginning of

Vegetable Cutlets

Once a week for the Harrington family, and of a special form of tomato with eggs, a favorite dish in the Swiss *pensions*. Both require care and delicacy of preparation; but they solve the problem of a central dish sufficiently imposing to satisfy eye as well as appetite, and this is how both are manufactured:

First, dismiss all prejudices as to "messes," and the usual objections to the unusual. Then assemble your materials, which should be as follows: Six or eight mealy potatoes, boiled and mashed as for the table, with butter and hot milk, pepper and salt. Mince fine two button onions and fry brown in a little butter. Have ready six of the tiny carrots which mature in July, and which have been boiled tender, and four young turnips. A little cold cauliflower chopped has been known to find place in them with good result. Chop all and mix well with the potato. Now make it in chop or cutlet shape; dip in beaten egg and then in cracker dust or Indian meal, and fry brown in hot lard or dripping. They must be immersed in the boiling fat like a cutlet, and cotton-seed oil answers quite as well as lard. Drain them dry, lay them on a large platter and surround by a good sauce. Serve very hot.

Tomato with Eggs.

If possible, secure for this dish one of the long, boat shaped earthen dishes one sees in German and Swiss kitchens, as it gives character and dignity. Peel the tomatoes and set them close together in this dish, which must first be buttered. Now scoop out a spoonful from the middle of each and chop it fine. Mince a small onion and fry brown in a spoonful of butter, add a cupful of bread-crumbs and a sprig of minced parsley, with salt and pepper to taste. Mix with the tomato and fill the cavities with it. Sprinkle bread-crumbs over the whole, dot with bits of butter, and bake for half an hour in rather a quick oven. When brown, break over the top an egg for each person to be served, and return to the oven till they are done, which will be in about five minutes. You will find it hearty and satisfactory, and a most desirable addition to the list of possibilities for tomatoes.—*H. Campbell in Congregationalist*

Business Announcements.

[NEW THIS ISSUE.]

Seed Sowers and Harrows—Baker & Hamilton.
New Western Hotel—Gallagher & Stanley.
Harrows and Seeders—P. P. Mast & Co.
Blue Ribbon Cart—Frank Brothers.
The Mechanics' Fair of 1890.
Percheron Horses—L. V. Willits, Watsonville.
Smith's Cash Store.
Sheep Dip—A. B. Cheney & Co.
Holstein Cattle—W. T. Eddy, San Jose.
Nursery Stock—Wirt Brothers, Salem, Oregon.
Pekin Ducks—Driswold Poultry Yards, Napa.
Trees—Ellwanger & Barry, Rochester, N. Y.

See Advertising Columns.

The Week.

The attendance at the State Fair this week has vastly improved, but it is hardly thought that receipts will be enough to make up for the loss of patronage through the occurrence of the great celebration in this city last week. Still the display, especially at the Park, is unusually good—the cattle exhibits being notably large and excellent. It is to be hoped that the closing days of this week will roll up as large receipts as possible, because the society needs money for improvements commensurate with the growth and prosperity of the State. Two letters concerning the State Fair may be found in this issue, and others will follow.

The Irrigation Convention at Tulare last week, of which we give an outline on another page, must be counted as the beginning of an important movement in our industrial progress. Its declarations should be carefully considered.

A New Truth.

A new truth dropped in among mankind and made clear, is a precious boon, never to be forgotten, always to bear fruit, and at last to become a household word, rule the State, reform the Church, and compel all mankind to conform to it.

To-day, the relics of the barbarous past rule all mankind; but the ideas, the truths discovered and promulgated, gradually dethrone kings, dissolve armies and give law to the nations. Europe has 5,000,000 soldiers armed to maintain the *statu quo* indefinitely, but she has also a thousand scholars who have written a few truths that will make them all vanish into thin air.

Not two centuries since, Galileo announced that the earth moved round the sun, a round globe. He was persecuted and tortured for his discovery. Now, all the children of Christendom accept the great truth, and no Church is powerful enough to deny.

A century past, our fathers gave out these words: "Government shall rest upon the will of the people and that alone, and the people shall think freely, boldly and fully, that government may be intelligent and secure. No man can or shall be justly punished for his opinions."

These words have shaken all the thrones in the world. They have modified the opinions of all the civilized portion. They have sunk deep into the American mind, and they are modifying our opinions, our laws, our conduct and our religion.

In San Francisco 300,000 people, with a hundred creeds, live in peace under their benign influence; each man feels his perfect right to think as he pleases and accords the same to his neighbor. So we have peace, religious peace, such as no other people under the sun enjoy.

These words did it. They came from the highest authority, those good and great Fathers. They are crystallized into law and heard daily in our courts. They have seized upon the public mind and men guide their conduct by these rules. Within a short time all will conform to these sublime words: "Opinions are not crimes."

Railroads Must Not Discriminate.

A result of much importance to shippers by rail has been attained in the Superior Court of Santa Cruz county by which the South Pacific Coast Railway Company has been inflicted with a verdict to pay $8000 because of discrimination and refusal to furnish cars to S. H. Chase & Co. for shipment of lumber from their mill near Boulder creek. It appeared in the evidence that Mr. Fillmore, then manager of the road, had given orders to refuse Chase & Co. cars, and as a reason stated that Chase & Co. were underselling the San Jose Lumber Association, and that by so reducing the price, freight rates would eventually have to be reduced, and therefore he refused to let Chase & Co. have cars. Mr. Fillmore also said that Mr. Chase refused to join the San Jose lumber combination, and told him that if he would join it he would be furnished all the cars he wanted. This Mr. Chase and his partner refused to do.

The case occupied the attention of the Superior Court for over a week, and during the course of the trial Chase & Co. abandoned some of their minor claims for damages, such as for expenses of keeping oxen when the refusal of cars stopped their work, the loss on sub-contracts to furnish lumber, etc., and confined their claims to actual damages caused by the loss of business and for punitive damages.

Judge McCann delivered a lengthy charge. The jury retired, and in two hours returned with a verdict for $8000 in favor of the plaintiff. The jury stood nine to three. Chase & Co. claimed $9706 actual damages and over $40,000 as punitive damages.

Though the verdict hardly covered the actual loss to Chase & Co., and though the company will probably fight the issue further, it is some satisfaction at least to have a verdict declaring that discrimination and the attempt of a transportation company to rule production and commerce instead of serve them are illegal. The country has suffered considerably by such discrimination and almost conspiracy between favored shippers and the railways against the business of other producers and shippers. The issue should be pushed in the public interest until common carriers are taught that they must treat all shippers fairly and impartially.

Settlement on Arid Lands.

There has been so much published about the effect of recent Congressional legislation on the settlement of arid or desert lands that there may be in the minds of some a doubt as to their present status or availability. For this reason we give prominent place to the following circular issued September 5th by Commissioner Groff of the General Land Office:

I am directed by the honorable Secretary of the Interior, by letter of Sept. 4, 1890, to call your attention to the attached copy of that portion of the Act of Congress approved Aug. 30, 1890, which repeals so much of the Act of October, 1888 (Twenty-fifth Statute, 526), as withdraws lands in the arid region of the United States from entry, occupation and settlement, with the exception that the reservoir sites heretofore located or selected shall remain segregated and reserved from entry or settlement until otherwise provided for by law, and reservoir sites hereafter located or selected on public lands shall in like manner be reserved from the date of location or selection. The circulars of this office of Aug. 5, 1889, and Aug. 9, 1890, are hereby rescinded. Entries validated by this Act will be acted upon in regular order, and all patents issued on entries made subsequent to this Act, and on entries so validated west of the one hundredth meridian, will contain a clause in them reserving right of way for ditches and canals constructed by authority of the United States. Your particular attention is called to that portion of the law which restricts the acquirement of title under the land laws to 320 acres in the aggregate. You will require from all applicants to file or enter under any of the laws of the United States an affidavit showing that since Aug. 30, 1890, they had not filed upon or entered, under said laws, a quantity of land which would make, with the tracts applied for, more than 320 acres; or, provided the party should claim by virtue of the exception as to settlers prior to the Act of Aug. 30, 1890, you will require an affidavit establishing the fact.

The Mohair Situation.

Conditions seem to favor a good price for mohair this fall. McNaughton's Sons of New York issue a circular, in which they say that the latest report from Bradford says: "Mohair good; alpaca advanced." This advance in alpaca will have a tendency to put up the value of mohair.

Importations of Turkey mohair have been very light this summer as compared with 1889, and if the present good market on the other side continues, fall shipments of domestic mohair will find a ready market in spite of the slight curtailed demand.

There is very little raw stock in New York now, so that quotations are merely nominal, being based upon the last sales by McNaughton's Sons, viz.: Fine combing, 45 to 50 cents; fine medium combing, 40 to 45; medium combing, 35 to 40; coarse combing, 28 to 35; carding, 14 to 16; burry, 10 to 15.

McNaughton's Sons mention fall shearing of goats as favored by reports from several of their correspondents, and urge the advisability of occasional fall shearing at least. As prices are good at present, the time is favorable for experiment.

Oregon State Fair.

Dispatches from Salem aver that the opening of the State Fair on Monday was marked by the most abundant entries and largest attendance in its 30 years' history.

The exhibits of the Willamette Valley grains and fruits are very large, as well as the display from Southern Oregon. One local grower has a five-ton exhibit.

Three carloads of Norman and Clyde stallions arrived from Illinois that morning, and the heavy horse show is good throughout. A marked improvement in draft horses is noticeable in Western Oregon over the stock of a few years ago.

The gate receipts for the first two days exceed those of last year. The crowds are increasing daily, each train bringing in many people. Nearly all the camp-grounds have been taken, while every available inch in the pavilion is occupied.

SIXTY-FOUR carloads of raisins, dried grapes and fruit left Fresno last week for Eastern points. This shipment is about three times in excess of shipments at this time last year.

Vegetables for the East.

We recently alluded to the unusual scarcity of staple vegetables as well as of fruits at the East, and mentioned the demand likely to arise for California potatoes, cabbage, etc. There is now a strong Eastern movement of these esculents of which the *Chronicle* recently gave an outline. Although large shipments of potatoes and some other vegetables to the East were made in 1887, there has never been a time in the history of the State when the vegetable product equaled that of the present year. During August the Southern Pacific Co. took East about 425 carloads of potatoes, or about 138,000 bushels. The shipments in pounds from the principal points were as follows: San Francisco, 5,513,930; Sacramento, 2,196,400; Los Angeles, 371,760; Colton, 157,890. In July the shipments were but a fraction of these quantities, and last year almost none were shipped. Aside from potatoes the following shipments of garden vegetables, amounting to about 100 carloads, were made in August last: San Francisco, 1,317,090 pounds; Stockton, 60,000; Los Angeles, 567,280. The shipments of last year amounted to almost nothing.

These figures do not represent the total vegetable shipments of the State, and especially of the southern portion, as they do not include the shipments by the Santa Fe. These figures could not readily be obtained, but they are very large and would greatly increase the totals given above. The explanation of this activity is, of course, the failure of the potato crop and the consequent scarcity in the East. Last winter California was supplied with potatoes from beyond the Rockies. Now the East is largely dependent on the Golden State. The active shipments of August are continuing, and the size of the total draft of the East on California's stores of garden and field products for the season will be surprising in its magnitude, and will represent new glory, advertisement and profit.

Caution to Farmers.

A concern calling itself "The Farmers' and Mechanics' League," has nominal headquarters at Room 61, Flood Building, San Francisco. The *Chronicle* says one X. E. Burns appears to constitute the entire "league," and figures on some cards as its manager. He boldly refers to the Mercantile Bank of this city, but the bank refuses to vouch for him and avers that the use of its name was unauthorized.

The "manager" sends a canvasser out into the country to drive around in a stylish turnout, call upon all the farmers and entice them to join the "league," paying a membership fee of $10 in advance. As members they will have the right for five years to order from the headquarters groceries, clothing, farm machinery and everything else they need, getting the goods at wholesale prices, and thus saving the profit of the country store-keeper. (Of the $10 the agent receives a commission of $4 cash.)

The farmers are not given any security that the contract which they thus enter into will be carried out; in fact, some of the canvassers assert that no provision was made to give those who joined even so much as a receipt for their money.

The alleged "manager" of the "league" has named a bank as reference regarding the reliability of his scheme without the sanction of its officers, and if he has, as he has asserted, millions behind him, he fails to show from whom the money comes.

Representatives of the RURAL, who went up to the place mentioned, found no one there but a little boy, and facts elicited by inquiry at a leading commercial agency leads us to believe that the *Chronicle's* article is reliable. We trust our readers are sufficiently on their guard not to be imposed upon by irresponsible schemers who promise commercial advantages without any genuine backing.

WELL DONE.—In the U. S. Senate on Tuesday of this week, the House Anti Lottery bill was taken from the calendar and passed without a word of discussion.

THE output of wine from Senator Stanford's vineyard of 4000 acres, near Vina, Butte county, this season, will be not less than 1,500,000 gallons.

Corn Palaces.

As we are in the midst of the fairs, and as the mind is naturally attracted by that which is unique in means of industrial display, we lay before our readers new facts concerning the development of the Corn-Palace idea at Sioux City, Iowa. We have shown views of these structures for several years, each year's palace vastly surpassing its predecessor in size of the structure and the elaboration. Upon this page we show in contrast the palaces of 1889 and 1890.

The Corn-Palace idea originated in Sioux City, and at that place all the palaces have been erected. A Corn Palace is covered and embellished, as with tapestry, outside and inside, with products of the field, corn predominating, ingeniously and fancifully arranged. In building the palace a large structure is first erected of lumber, of a shape that will carry and show to advantage the multiform decorations with which it is to be adorned. It is in form lofty, with broken lines, pinnacles, buttresses, bridges, gable, ornamental window, etc. Over every inch of this wooden surface are laid corn and kindred plants in architectural harmony, in a multiplicity of designs. The corn is employed in the stalk, the ear, the kernel, and even the husk has its decorative uses. All the grains and grasses of the field lend themselves to the beautifying of the palace. The walls are covered on the outside with ears of corn, cut lengthwise or crosswise, and nailed on in geometrical figures or other designs. The various colors of the cereal permit of a wide range of shading and coloring, while its artistic possibilities, developed from year to year in building the palace, admit of the production of effects that are as startling as pleasurable.

High over the entrance of the Palace of 1889 was King Corn's crown as the nucleus of the sunburst, while below was the national flag in graceful folds—all wrought in vari-colored corn, as true and as beautiful as if painted by an artist's brush. The roof is overlaid with corn leaves. Pinnacles and columns are capped with the sorghum plant, or with grains and grasses. The iridescent walls, seen from a near distance, seem to be a rich mosaic of polished woods, while with the "Banners, yellow, glorious, golden," that "from its roof-tree float and flow," the palace enraptures the beholder as one who looks upon a cloud-painted mansion that may dissolve before his eyes.

The interior work is finer and more elaborate. Here the kernel of the corn is largely employed, producing amazing and lovely effects. On the walls are wrought pictures illustrating farm scenes, legendary and nursery tales, etc., with a fidelity that is calculated to raise a doubt that the material employed is the homely utilitarian growth of Western farms. Frescoes and flowers, figures of persons and animals, draperies, and thousands of surprising and beautiful things are made of field plants for the delight of the visitors to the palace, whose astonishment is succeeded by admiration of the genius that conceived and developed so much of art and beauty from such homely fabrics as are employed.

The Corn Palace of 1890 is to be 264 feet square, or more than twice as large as last year's Palace, which was 120x240. The central building will run up to the imposing hight of 172 feet, the upper 100 feet being a dome. This main building will be in the form of an octagon 166 feet across. In the center will be an open space 78 feet across, without a post or anything to interfere with a view of the whole interior decorations. This space will run up 66 feet with an artistically painted sky at the top, studded with stars of incandescent electric light. The gallery in the Palace will be clear around the interior of the rotunda, 44 feet high, and will be 25 feet wide. This gallery will give every one an opportunity to see all there is to be seen, and it will be adorned with various exhibits as well as overlooking all the rest of the palace.

East of the main building, opening into it by two gates, will be an auditorium to seat 1000 to 1300 people. The band-stand will be between this and the rotunda, so that the music may be heard by every one in the Palace.

At the north of the main building will be another lower structure running back 100 feet. This building will run around back of the main building to connect with the auditorium, and will be 100 feet deep clear around, roofed and concealed by a battlement. There will be grottoes, beautiful and original ideas worked out in corn and showing the wealth of the great agricultural Northwest as well as the ingenuity and artistic taste of her people. One of the wonders in preparation is a miniature Niagara Falls, located so that it will be the first thing to greet the eye of the spectator as he enters the building. Here he will look down to the farthest part of the great structure, 272 feet from the main entrance, with an uninterrupted view 48 feet wide and 44 feet high. The space of one side of the octagon, 48 feet, which is the entrance to the back part of the palace, will be crossed at the gallery floor by a rustic bridge, from which all parts of the palace may be seen.

The decorations this year, both interior and exterior, will be projected on a scale grander and more elaborate than ever before. The exhibition will open September 25th and continue until October 11th.

FLORIST AND GARDENER.

Cacti and Succulents.

[An essay read by F. A. MILLER at the September meeting of the State Floral Society.]

This class of plants, apparently, does not take as well with our people here as other classes of flowering and ornamental plants. This is partly due to the slow growth of some and the short flowering season of others. Some species of the Cacti family produce most gorgeous flowers, and some of the Succulents are extremely ornamental, and when we add to their good qualities the fact that in our favorable climate we can grow them without protection and almost without any care, it seems strange that their cultivation is so much neglected. Here and there we see a cactus in some out-of-the-way place, and occasionally we see a few Succulents about a rockery, while a very few are used for bedding. The cactus family consists chiefly of Cereus, Echinocactus, Epiphyllum, Echinocereus, Mammillaria Melocactus and Opuntias.

THE CORN PALACE OF 1889, SIOUX CITY, IOWA.

THE CORN PALACE OF 1890.

1. The Cereus family includes the most showy flowering species which are met with most frequently. Among them we find Cereus speciosissimus, the most showy of all; its flowers are large, of a beautiful scarlet with a purple or metallic blue shading inside, the numerous stamens being white; usual time of blooming, June to August; plant, three to four angled, erect; its native country is Mexico. Cereus fulgidus, flowers large, orange scarlet, freely produced, from Tropical America. Cereus grandiflorus, the night-blooming cereus, stems five to six angled, climbing. The calyx of its large flower is yellow inside and brown outside. The petals are pure white; very fragrant. The flowers begin to open about 8 o'clock in the evening, are fully expanded about 11 o'clock and then measure 10 to 12 inches in diameter. About 5 o'clock in the morning they begin to fade; it is one of the grandest and most beautiful flowers ever produced by Nature; a native of the West India islands.

Cereus Macdonaldiæ is another most elegant night-blooming species from Honduras, sepals bright red and orange, petals white. There are many other beautiful species, but I will mention only one more, the Cereus giganteus, a native of New Mexico, which has attracted so much attention in late years. This plant grows from 40 to 60 feet high and about two feet in diameter; some of them are branched, most of them are not, looking like huge telegraph poles. The branches issue at right angles from the stem and then grow upward parallel with the main trunk. The flowers are borne at the summit of the stems, four to six inches long and four inches in diameter of a light cream color. The fruits are about three inches long and oval. The crimson pulp is used by the Indians as an article of food and makes an excellent preserve.

2. The epiphyllum, popularly known as fuchsia cactus, is a genus of free flowering plants, blooming during the winter. There are three species and a number of varieties, all natives of Brazil, where they are usually found growing upon the trunks of trees. The leaf-like branches growing out of one another form a neat and graceful, somewhat bushy plant, and the flowers are hanging from the end of the branches. The flowers are all of bright colors, deep scarlet, bright orange red, white-edged purple, bright rose, reddish salmon and other shades. By grafting the epiphyllum upon pereshia stocks, very fine specimens can be obtained of any desirable hight, and these are mos beautiful ornaments.

3. The echinocacti, popularly known as the hedge-hog cactus, are chiefly cultivated for their grotesque forms; although some of them produce very showy flowers, all are more or less fluted and ribbed. Perhaps the largest species is the echinocactus visnaga of Mexico. Fifty-one thousand spines have been counted on one plant; the spines are used by the Mexicans as toothpicks; plants have been found to weigh one ton, measuring nine feet in hight by three feet in diameter. Some very handsome varieties are found in Southern California, Arizona and New Mexico.

4. Echinocereus is a class of dwarfish-growing cacti, not growing over 12 to 15 inches high. The flowers are quite apart but handsome. One of the prettiest species is echinocereus pectinatus of New Mexico. The spines are of bright coloring, the fruit is purple, resembling a gooseberry, and is very good eating.

5. The mammillaria, or pin-cushion cactus, are very dwarfish growth and cultivated only for their odd shapes and forms.

6. The Opuntias, commonly called prickly pears, are interesting, but not so desirable as ornaments. Some of the tall-growing varieties are used for hedges, some bear good edible fruits, while a few of them produce quite showy flowers. One species is largely cultivated in Mexico for the rearing of cochineal insects, the females of which are placed upon the plants in August, and in four months the first crop of insects is gathered, with several more crops to follow.

7. Phyllocacti are cultivated on account of their large white flowers, which are quite fragrant. It has been classified from time to time as Epiphyllum and again as Cereus. It is distinguished from both, however, by the curious, flat, broad, leaflike branches, and by their flowers being produced from the notches along the edges of the branches. The species cultivated here and shown at our floral exhibition is Phyllocactus Anguliger. The flowers are seven inches across. It is a native of West Mexico. There exists also a scarlet flowering species, called Phyllocactus Ackermanni, and a large wine-colored, flowering variety.

Of Succulents, we have about 18 families, some of which are very little known in California. A well-known genus is that of the Agave. The best-known species is that of Agave Americana, or Century plant. Large plants of this species are often found in our gardens, and it is also known under the name of American Aloe, originally found in South America. Mexico has a similar variety, and the variegated form often seen about here is the handsomest variety. The popular belief that this plant only flowers once in a hundred years is erroneous. A large number of them have flowered here at the age of 12 to 15 years. Whenever the plant has attained its majority, it sends up its flower stalk to a hight of 20 to 40 feet, and after flowering it dies. This Agave was first introduced in Europe in 1561. In 1663 the first plant flowered in Paris. The species is not only ornamental, but also useful. The leaves produce a strong fiber for the manufacture of twine and rope; the juice makes a very good soap, which can be used with fresh as well as salt water. The sap also furnishes a beverage resembling cider, and the fresh leaves are cut up in slices and used as fodder for cattle. There are a great number of species. The smaller-growing kinds are cultivated as pot plants, the larger kinds for ornamenting rockeries, vases, terraces and rustic nooks.

Echeverias, popularly called "Hen and Chickens," grow in the shape of rosettes, and are mostly used for rockwork. Some of them make excellent border and bedding plants, and a few, such as Echeveria metallica, make very handsome pot plants. They thrive well without much moisture or care, and when water is scarce for irrigation purposes, nothing can replace them. There are over 100 species; three species are found in California.

Aloes. These are a very interesting class of plants, having most peculiar forms. They show great diversity of hight; some are very dwarfed; others grow 10 to 12 feet high. The flowers of many kinds are quite brilliant. A most important product from this genus is the drug known as "aloes," which is obtained from the resinous juice of the leaves. There are a great number of species, many of which are cultivated as ornaments. They require scarcely any moisture and are easily taken care of. Some of them are so peculiarly marked that they will necessarily excite your admiration. For rockeries they are most useful.

Mesembryanthemums. These are a very important class of plants for bedding purposes as well as for hanging baskets and vases. About 150 varieties are cultivated in European gardens. The upright-growing kinds produce a great mass of brilliant flowers, and as they can be grown almost without any irrigation, they are most desirable on that account. Banks and terraces can be covered with them at very little expense. I hope that every member of this society will experiment with these plants.

Stapelias, a genus of Succulents very well known here, are natives of the Cape of Good Hope. Over 100 species are known. The branches are generally four-sided and toothed, and have an extremely grotesque appearance. The most singular large flowers grow out from most any part of the stems; a great variety of colors, forming exquisite marbled or dotted patterns, makes it a flower of great beauty. In Europe they are extensively cultivated on account of the peculiar shape of the plants and

for their most beautifully marked flowers. There are a number of less important Succulentæ, such as Rhipsalis, Crassula, Sempervivum, Fouroroya, Bryophyllum, Dasylirion, Dyckia, Euphorbia, Garteria, Rochea and Doryanthes; but time will not permit me at present to go into a detailed description of them.

AGRICULTURAL NOTES.

CALIFORNIA.

Butte.

A LARGE ORCHARD.—Chico *Enterprise*, Sept. 11: Last week General Bidwell had surveyed 700 acres, which will be added to the orchard business of the Rancho Chico. Five hundred acres will be a portion taken from Chico Vecino and 200 acres adjoining Lindo creek, 100 acres of which will be set out in Bartlett pears. There will be 44,000 trees put out altogether in this new orchard, all of the choicest varieties, including French prunes. This, in addition to the 1500 acres already in orchard, will make 2200 acres of orchard on the Rancho Chico.

Contra Costa.

ALMONDS. — Martinez *Gazette*, Sept. 10: Every succeeding year new orchards and vineyards are coming into bearing, and the productive capabilities of different sections are more fully demonstrated. It is a well-recognized fact that within an area as small as the county of Contra Costa there exists so wide a diversity of climate and soil that fruits which grow to perfection in one section will not thrive at all in another, and it is by closely studying these relative conditions that the greatest and most profitable returns can be obtained. San Ramon has established a reputation for almonds among other fruits, and the east side of the county promises to come to the front with the same product. Mr. Jasper J. Jones left with us a lot from the orchard of Alexander Brown in Deer valley, about four miles from Brentwood. They were bleached and ready for market, very handsome and of fine flavor.

Fresno.

CANAL WORK.—Fresno *Republican*, Sept. 12: What is known as the Bank of California tract, beginning ten miles west of Fresno, is now alive with teams and men cutting ditches from the larger canals of the Fresno Canal & Irrigation Company, to conduct water for irrigating purposes to each quarter-section of land. The main canals were cut last winter. This immense tract, comprising about 37,000 acres of land, will, it is understood, be subdivided this fall into colony lots and placed on the market. All lands west of Fresno are looking up splendidly this season. Active work on new canals, the early prospect of two different lines of railroad, and the actual planting of hundreds of acres in raisin grapes during the past year has caused investors to regard west-side lands with favor.

FRESNO COUNTY STATISTICS.—Mr. Recarte, special census agent, will report that there are 47,910 head of cattle assessed in Fresno Co., and he places the number on the ranges at 16,800. The assessment shows 303,599 sheep, while the census will show 175,000 on the ranges. The number of horses is placed at 13,568, and of jennies and jacks at 35. Of foreigners in the business, the French, Basque, Italians and Swiss predominate. The Durham and Devon stock is generally preferred by the men on the ranges, being large framed and heavy and better adapted for beef and the general market. Mr. Recarte's report on Fresno county will be a very flattering one. The cattle here were found in prime condition, the feed abundant, and thrift and enterprise everywhere apparent. A band of 3000 cattle would here be divided about as follows: Cows and calves, 1600; dry cows, 100; yearlings, 600; two-year-olds, 600: and three-year-olds, 100.

Kern.

HOGS DYING.—Bakersfield, Sept. 11: Some fatal disease is prevailing among the hogs on the north side of the river. E. M. Roberts has lost 60 head—all he had. O. Brown has lost 70 out of 75 head, and others have lost in proportion. It is not thought to be cholera, but no other name has been given to it yet.

CATTLE RANCHES.—Bakersfield *Echo*, Sept. 11: Kern county still has some pretty large cattle ranches. O. W. Jackson tells us that on Haggin's Jackson or Poso ranch there are now 30,000 head of cattle, 12,000 of which are fat steers three and four years old. The fields on which they range are fenced.

Los Angeles.

A TOMATO TREE.—L. A. *Express*, Sept. 11: There is a tomato tree at Germain's greenhouse that is a curious specimen of tree culture. It is a native of Guatemala, and the fruit grows in clusters, the tomatoes being smooth and perfectly oval in shape. They are now green, but they will turn first yellow and then to a glowing red, when they will be ripe. They taste very much like the ordinary tomato. This tree is but two years old, and last year it bore a dozen or more tomatoes, and this year the branches are full.

FRUIT FREIGHT FACILITIES.—Pasadena *Star*, Sept. 11: The unprecedented fruit shipments of the present season have created the greatest pressure. There are 1316 cars on the Southern Pacific alone, built expressly for fruit transportation, now engaged in carrying California fruits to the Eastern markets, besides other cars pressed into the service. Of these, 284 are refrigerator cars belonging to the California Fruit Transportation Company of Chicago. There are 125 refrigerator cars belonging to other companies. These refrigerator cars are run on fast-freight time. The Southern Pacific Company owns no refrigerator cars, but has 615 ventilated cars in use, with about 300 similar cars belonging to the Union Pacific. Fruit shipped in these cars is sent through on passenger-train time. These 1300 cars fail to meet the demand, and the shipments would be still greater if cars were plenty. In order to keep pace with the great demand, most of the fruit cars are rushed back empty—an unusual thing in railroad operation.

ORANGE SHIPMENTS. — Pomona *Progress*, Sept. 11: There has been so much speculation concerning the quantity of oranges sent away from this part of the State, this year, that we have taken rare pains and done a good deal of vexatious figuring and letter-writing to obtain exact statements of the orange shipments from all points on the railroads in this region, with the following result:

	No. of boxes.
Los Angeles county	368,275
San Bernardino county	341,940
Orange county	133,141
Ventura county	10,867
Grand total	854,223

ORANGE PRICES.—Bids for the orange crop of next winter have already begun to be made, and they are higher than at any time in three years. Porter Bros., the wholesale dealers in California fruits, told a San Francisco reporter the other day that good seedling oranges would be worth not less than $1.60 a box next winter.

RAISIN PROFIT. — At the present market price, the raisin-growers of California can easily net from $200 to $275 an acre; but there are some vineyards bearing such heavy crops that the property will yield crops worth over $350 an acre.

PRICES FOR WINE GRAPES.—L. A. *Herald*, Sept. 7: The San Gabriel Wine Company is contracting to buy grapes at $13 a ton, and dried wine grapes have gone up to $70 a ton in two weeks. The men who bought grapes at $7 and $8 a ton for drying purposes will make about 150 per cent on their investment.

Mendocino.

HOPS.—Ukiah *Republican*, Sept. 13: The hop-picking season is now about over and the laborers have returned home. The crop in this valley was lighter than expected, but the hops are all first-class; so if we have not the quantity of former years, we can content ourselves with the fact that we have the quality. Hops are worth from 30 to 35 cents per pound.

Monterey.

FIRST FRUIT SHIPPED EAST.—Salinas *Democrat*, Sept. 13: The first fruit perhaps ever raised in this valley and shipped East for sale, was a lot of 200 boxes of Bartlett pears, which last week were shipped by Chauncey Dayton to a party at San Jose and there repacked and sent in refrigerator cars to Chicago, where they were sold in 40-pound boxes at $4 per box, or at the rate of 10 cents a pound.

BARLEY YIELD.—Salinas, Sept. 14: A. J. Brahmer owns 70 acres of land near Salinas. He raised on this 70 acres 1452 sacks of barley of 111 pounds each, or 1611 centals, or 3300 bushels, which he sold at $1 10 per cental. William Bardin raised on 68 acres near Salinas, 2159 sacks of barley, of 112½ pounds to the sack, which he sold for $1.07½ per cental. James B. Iverson on ten acres got of Chevalier barley 272 centals, or 545 bushels.

SUGAR BEET PROFIT.—Salinas, Sept. 14: James B. Iverson raised 11 tons of sugar beets to the acre, for which he got $5 75 a ton. Ira Tucker from ten acres of sugar beets got $564.

SUCCESSFUL FARMING.—Salinas, Sept. 14: Mr. Mercer seems to be a successful farmer in a small way, added to his other occupation of wagon-maker and machinist. He grows beets one year, next year barley, wheat or beans. The land is always in fine condition and the yield is big; this in consequence of rotating crops. The Hanson Bros. have raised a large crop of beans this year off 157 acres. The pink beans they sold for $2.75 a cental. Next year this land will be sown to barley or wheat and another 160 acres or more will be used for beans. They have grown wealthy in consequence of successful farming. A rotation of crops will have to be followed to keep the land clean; otherwise all our lands will become valueless for farming.

Orange.

PAMPAS PLUME FARM.—Anaheim *Gazette*, Sept. 11: A couple of miles north of town Max Nebelung has ten acres planted to pampas plumes, the crop of which he is now gathering and curing for market. He has some 3500 plants, and will harvest in the neighborhood of 40,000 plumes. Only one acre is in full bearing at present, the plants being about four years old. The other nine acres are set with plants only a year old, but they are yielding satisfactorily. Max has about 20,000 plumes gathered already, and has the ground about his packing-house covered with drying plumes. The sight reminds one forcibly of a snow scene, the white plumes covering the ground for several hundred yards. Three days and nights are required in the drying, and the plumes are benefited by slight fogs, so that it is unnecessary to shelter them at night. A ready market is found for the plumes, which bring about five cents apiece. When the plants on the entire tract reach an age of four years, Max expects the yield will be 100,000 plumes. The plumes are used purely for ornamental purposes, and great quantities are shipped to the East and Europe, where they are worked into large bouquets.

WALNUT ORCHARD.—Los Angeles, Sept. 13: Several San Diego men of means have purchased about 600 acres of land one mile north of Garden Grove, in Orange county, which is to be set to walnut trees. The price paid was from $40 to $60 per acre. The land is said to be well suited to walnut culture. Work of improvement will commence immediately. The tract is owned in small parcels, but it will be worked as though owned by one man. Substantial buildings are to be erected and other necessary improvements made incident to the culture of the walnut. While the trees are growing, potatoes, Lima beans and peanuts are to be cultivated.

San Benito.

GRAIN YIELD.—Hollister *Free Press*, Sept. 12: W. A. Johnson has brought to this office from his Santa Ana ranch a sample of wheat, one stool, which contains over 100 heads. From 325 acres of land, Mr. Johnson obtained 3902 bags of grain, 500 bags being of clevalier barley, 728 bags common barley, the rest Australian wheat. Mr. Johnson is now breaking a pair of twin colts which are perfect mates, and which he will exhibit at the coming fair.

San Bernardino.

LARGE YIELD OF CORN AND PEANUTS.—Chino, Sept. 6: D. Lawson's corn is making a big crop. He brought a stalk to this office a few days ago which is only a fair sample of much of the whole. It is 10½ feet high, with two large and perfect ears. His two acres of peanuts are in splendid condition, and the yield will be large.

San Diego.

EXPORTING WHEAT.—S. D. *Sun*, Sept. 10: Spreckels Bros.' Commercial Company are making arrangements to send at least two cargoes of wheat from San Diego to Liverpool, and it is quite probable that they may be able to ship three full cargoes. From San Jacinto, Perris and other portions of the county, something over 26,000 sacks of wheat have already been purchased. Yesterday six carloads of wheat arrived from San Luis Obispo, having come by the Southern Pacific as far as Los Angeles, and from there to San Diego by the Santa Fe. This was the first consignment of 19,000 sacks of wheat bought of the Porter Land and Water Company. There yet remains in the neighborhood of 200 cars of wheat to be forwarded via Los Angeles to San Diego. It is reported that Mr. Spreckels has also purchased several other large consignments of wheat from the country around Los Angeles, all of which will come to San Diego to be shipped to Liverpool. In all, 500 or 600 cars of wheat will be shipped into San Diego this year for shipment to Europe.

PINEAPPLES.—San Diego, Sept. 11: Pineapples are now approaching perfection in San Diego. The few which were planted as an experiment demonstrate that they can be grown in Southern California with profit.

POTATO PLANTING.—S. D. *Sun*, Sept. 11: A commission merchant interviewed says: I know of one man in the Cajon valley who is planting 50 acres to potatoes. I know another man in the same valley who is planting 40 acres to potatoes and another ten acres. Those that I have mentioned would make 100 acres, and with a good yield will produce 10,000 sacks of potatoes, or 1,000,000 pounds. There will be other large potato-fields planted in the Cajon valley, in the Sweetwater valley, Otay, Tia Juana, and in all the rich valleys in the county. I think I do not overestimate when I say that there will be from 500 to 1000 carloads of Irish potatoes raised in San Diego county this year.

LARGE WHEAT FARM.—S. D. *Union*, Sept 11: In the Temecula valley the Pauba and Temecula Land and Water Company will put 4000 acres into wheat for the first time, all of which, when harvested, will be shipped through San Diego.

SHIPPING HONEY.—San Diego, Sept. 9: Last year E. Lovett shipped 14 cars of San Diego honey, and this year he expects to send about 30. So far he has sent one car of comb honey and eight of extracted honey to New York and Chicago, respectively. Another car of extracted is being packed to leave in a day or two, and next week a car of comb honey leaves, all of it going to Chicago or New York. The product is unusually fine.

San Joaquin.

PLANTING FRUIT TREES.—Stockton, Sept. 5: Hundreds of acres of land in the San Joaquin valley will be planted with trees and vines next spring, and nurserymen may confidently calculate on doing a bonanza business. The reason for the rush next season is twofold. People are beginning to understand the advantages of the soil they possess, and appreciate the profits to be derived from fruit culture. Last season, owing to the unprecedented wet weather, no planting to speak of could be done, so next spring lost time will be made up.

GRAPES WITHOUT IRRIGATION.—Stockton *Independent*, Sept. 10: If any one doubts the feasibility of raising grapes without irrigation he should have seen the evidences displayed in the *Independent* office by A. Starkweather, whose ranch is near Farmington, of seven or eight different varieties of wine, table and raisin grapes of great size and delicious flavor which he has cultivated as an experiment on a couple of acres of his land. He has 100 vines that are four years old, comprising Black Prince, Black Hamburg, Purple Damascus, Muscat, Muscadine, Sweetwater and Gordo Blanco, the last a raisin grape. They yield prolifically, the bunches are large and the grapes equally so, and he is so fully satisfied with his experiment that he proposes to extend his vineyard.

Sonoma.

PHYLLOXERA.—Santa Rosa *Republican*, Sept. 11: Phylloxera has decimated many of the vineyards in Sonoma valley, yet the vineyard men, as a general thing, have reset the land with resistant vines, which are not yet in bearing. This dread vine disease, against which the vineyardist has so far discovered no remedy or prevention, is slowly creeping up the whole length of the valley, having now reached as far as the vines of Henry Bolle and Wm. Appleton of the Upper Los Guilicos. The loss thus sustained in the grape yield will be made up by a greater yield in the mountain and other valley vineyards, which have yet shown no sign of suffering from the vine pest.

ESTIMATED FRUIT CROP.—Santa Rosa, Sept. 11: Green prunes furnished driers and canneries 4000 tons at an average price of $50 per ton. Not less than 5000 tons of green peaches have been disposed of in this manner, used and dried upon the farm, sold and shipped, the average price being $60 per ton. Bartlett pears, 1500 tons at $45 per ton; plums of all kinds, 1000 tons at $30 per ton; blackberries, 300 tons at $60 per ton. It is thought that the apple crop of the county will amount to at least 5000 tons at an average price of $15 per ton. To them might be added of the smaller fruits and berries, strawberries, raspberries, etc., $5000. The grape crop will approximate something like 50,000 tons.

HOP YIELD.—Santa Rosa, Sept. 11: The hop crop, though not as large as last year, will, on account of the largely increased price, add more to the hop-growers' bank accounts. The estimate of the hop crop in the county this season is about 5500 bales, or 1,100,000 pounds.

DRIVING GEESE TO MARKET.—Petaluma, Sept. 13: A drove of over 200 geese were driven into town to-day. They were raised near Guerneville and driven here, a distance of 25 miles, for a market.

GRAPE DRYING.—Cloverdale *Reveille*, Sept. 13: The drying-fields at Porterfield's and Oat Valley are beautiful sights to behold. The acres of trays with the black and green grapes form a contrast of much beauty. To dry the 1000 tons contracted for, many acres of ground will be covered. The progress of this manner of drying will be watched with much interest.

HOP-PICKING RECORD.—Healdsburg *Democrat*, Sept. 11: The best record in hop-picking in this county was made last Friday by E Hohenstein, who plucked 240 pounds in one day. Dan McCann comes next with 230 pounds in the same time. A young lady of Healdsburg, who is not too proud to work in the hop-fields, has established a record for picking that it will be hard for one of her sex to beat. On the 1st she picked 176 pounds, on the 2d, 203, and on the 3d, 207. At the rate paid for picking in that part of the county, this means an average of nearly $3 a day.

Sutter.

COON HUNTERS.—Yuba City *Independent*, Sept. 13: A. D. Case, Lon Case, Charlie Best, Al. Allen and T. E. Case are the boss coon-hunters of Sutter county. One night last week they went down to the neighborhood of Ashford's warehouse and in a little while secured five large coons, and on a night or two later in the same vicinity they captured four more of the thieving "varmints."

Tulare.

LARGE FRUIT ORCHARD.—W. M. McFadden writes, Sept. 8th, from Tulare to the Anaheim *Gazette*: I drove out west to the famous orchard and vineyard of Paige & Morton, containing about 1300 acres and employing since the fruit season began (June 16th) 380 laborers, composed of white men, women, girls, boys and Chinamen. The employes have been picking and caring for 50 tons of fruit daily—first apricots, then peaches, pears and prunes, and now they are at work on the raisin grapes. I never saw such clusters, nor such a crop. It is estimated that each vine will average 75 pounds; many will go over 100 pounds, particularly the Sultanas. It was rumored while we were there that this immense place had been sold a day or two before in San Francisco for $710,000. A large drier, with a 70-horse power boiler and a 20-horse power engine and 7000 feet of two-inch pipe for drying the second crop of grapes, had just been completed at a cost of $7000.

LARGE WHEAT YIELD.—Visalia, Sept. 11: J. J. Kern of Lindsey, Tulare county, raised 150,000 sacks of wheat containing two bushels each. To harvest this immense crop, he had two steam harvesters and two 24-horse harvesters, that cut and thrashed at the same time, and five 24-foot headers and two steam thrashers.

DRYING GRAPES.—Traver *Advocate*, Sept. 11: The drying of grapes is in full blast in the colonies about Traver. The vineyardists and their families—those that have any, and we are sorry to say there are a few who have none—are busy from early morn till dewy eve. The crop is heavy and prices good, so the growers are happy. There seems to be help in plenty to handle the crop, and some of the growers already have their raisins in sweat-boxes. The weather is not so favorable for drying as it has been for some past seasons, there being more

moisture in the air than usual at this time of the year.

WHEAT SURPLUS.—Visalia, Sept. 11: The West Side country will ship 1200 carloads of wheat this season.

MORE FRUIT LAND.—Visalia *Delta*, Sept. 11: A. F. Thompson of Pleasant Valley was in town last week. Mr. Thompson is going in for orange-growing, and he set out last spring 5000 seedlings, which he says are doing finely. Mr. Thompson states that the great desideratum heretofore has been water, and as the farmers have got plenty of it now, fruit-growing will soon become an important industry in that neck of the woods.

GOOD PRICE FOR LAND.—Visalia, Sept. 11: J. S. Robinson sold a half-section of land, one mile west of Armona, set to vines, to Los Angeles parties for $300 per acre. Several sales of real estate have been made recently in that section of this county.

Yolo.

GRASSHOPPERS AND ARMY WORMS.—Woodland *Democrat*, Sept. 11: For the past few weeks, our farmers have been watching their alfalfa crops very closely. The army worm and the grasshopper are both here, although not in such quantities as in the early days. In some cases the crops in young vineyards have been entirely destroyed by them. C. Eakle lost all his grapes by the grasshopper, and others have shared a like fate. In other cases the alfalfa crops have fared badly from the effects of both the worm and the hopper. Mrs. P. Hannum had saved some alfalfa for seed; the worm attacked it and she was obliged to cut it for hay in order to save any of it. Mr. Dopkins, we understand, was caught in the same predicament, while the pastures of those who have lately irrigated and where the clover is just beginning to grow nice and green, are full of the hoppers, and the worms have also attacked many others.

GOOD RETURNS — Woodland, Sept. 13:—Miss Hattie Odlum has a 12 acre vineyard four miles out of town, which produced a very large crop of Zinfandel grapes. The vines are only five years old. Miss Odlum has sold her crop to San Francisco parties, dried in the sweat-box, for $70 per ton, which is as good to her as $20 per ton on the vine.

BIG YIELD OF RAISINS.—Woodland *Mail*, Sept. 13: Our raisin-makers are generally finding that the raisin crop this year is so largely exceeding that of average years that they are woefully short of trays, and are, therefore, at no small annoyance in handling their crops. They are now rushing their work as rapidly as possible and complain of the lack of hands. Mr. Jeff Clanton finds that 6000 vines on his place load 7000 trays of 30 pounds each. He is employing Japanese pickers and is very well satisfied with their work. Mr. Clanton verifies what the *Mail* said some days ago about the extraordinary fine quality of the Yolo raisins this year. This county will eclipse all precedent this year by untold thousands of boxes in the shipping of raisins.

REMARKABLE APPLE TREE—Woodland, Sept. 13: Dr. L. B. Holmes has a wonderful apple tree. Up to this season the tree has behaved itself very well, showing no strange or unnatural tendencies, but this year, not satisfied with yielding its usual crop of Early Harvest apples, it straightway commenced to grow a second crop. What seems so strange is that this second crop is borne upon short twigs that grow straight and stiff from the trunk and major limbs of the tree. Each twig, which is about four inches long, is limited to one apple, and is often leafless, bearing an uncouth and unnatural appearance. But this is not all. Blossoms presaging a third crop of apples are already appearing on this wonderful tree, which seems to put at defiance the common order of vegetable life.

NEVADA.

CATTLE DYING —Virginia *Chronicle*, Sept. 10: Geo. Bradford from Northern Elko says cattle are dying up that way from some unknown cause. They are generally in good condition and mope around for three or four days before they die. The Dayton *Times* says: A number of cattle in Mason valley have died lately of what is known as bloody murrain. S. B. Hinds has lost a dozen or more cattle from this disease, and other cattle-owners have lost from two to six animals. The disease is sudden and fatal. Mr. Hinds has been riding among the cattle right along and has not yet found any sick; they are always dead.

THE STICK OF WOOD IN THE BARREL.—A correspondent of the *Practical Mechanic* writes that he has tried the experiment which has been written about in the press of late, of inserting a stick of wood in a barrel or hogshead of water to prevent its bursting when frozen, and has found it an effective remedy. He says he had no faith in the success of the experiment, but decided to risk one barrel, so inserted a stick about 4x3 inches and let the barrel freeze up solid, and much to his surprise the barrel was uninjured, the ice bulging up around the stick, but not a stave or section of the head started. This is a valuable thing for all to remember.

DURING the heated spell a few days ago, workmen removed a street-car rail at Reading, Pa., and it expanded so much that it could not not put back in its place.

The Colorado Desert.

[Written for the PRESS by C. R. ORCUTT, San Diego.]

The broad alluvial plains lying west of the Colorado river, in San Diego county, California, are generally known under the name of the Colorado Desert. These plains and the contiguous barren hills and mesas have as yet been scarcely explored by man, and only small portions of this region have yet been in any way carefully examined.

Nearly one-half of this arid section of the West lies within the Mexican Territory of Lower California. Altogether it probably exceeds 12,000,000 acres in extent. In all probability no portion of the arid lands of the United States is as little known, but in reality of as great value, as is this great basin, the larger portion of whose surface is below the present sea level, and whose surface is strangely strewn with millions of both fresh-water and marine-fossil shells.

That portion of the desert in San Diego county is rich in mineral wealth, and not destined to always remain agriculturally a desert, even in name.

The Gila desert, in Arizona, is an eastern extension of this arid tract; while on the north the Mohave desert is only separated from it by a low range of sterile mountains.

The Colorado Desert division of San Diego county lies between the San Jacinto range of mountains on the west and the Colorado river on the east, bounded on the south by the Gulf of California and on the north by the eastern extension of the San Bernardino range, which separates it from the Mohave Desert section of San Bernardino county. The peak of San Jacinto, at the northern line of the county, is the highest land in California south of Mount San Bernardino, and rises precipitously from the plains of the desert to the hight of 9000 feet. Its snow-crowned, pine-clad summit appears in strong contrast to the naked, heated plains at its eastern base.

Between San Bernardino and San Jacinto Peaks

There lies the low San Gorgonio pass through which the Southern Pacific railway wends its unimpeded way; and at the summit of this pass is located the thriving town of Beaumont. A few miles farther east is another lively town—Banning, which, with apparently an abundant supply of water, has changed a portion of the desert slope into smiling vineyards and orchards, interspersed with fields of grain. From Beaumont to Indio, for a distance of nearly 50 miles, there is a gradual descent from the fertile lands of San Bernardino valley to the ash-like bed of the famous "Dry lake." This constitutes the Cahuilla valley, bounded on either hand by an austere mountain range some ten miles in average width and 50 miles in length. The wash or drainage from this valley falls into the Dry lake mentioned, and several perennial mountain streams lose themselves very effectually before traversing its bowlder-strewn plain. The Whitewater river at times forms a broad, turbulent stream, flowing from the San Bernardino range; while Snow cerek and numerous other lesser streams run more or less spasmodically from the treeless northeastern slopes of Peak San Jacinto.

The Southern Pacific R. R., after traversing the full length of this, maintains about the same general direction—southeasterly—across the great cheerless plains of the Colorado desert proper to Yuma, a total distance of nearly 160 miles. The old military post of Fort Yuma was situated on a commanding bluff on the west bank of the Colorado river and therefore in California. The town of Yuma is on the opposite bank in Arizona. Fort Yuma was in the extreme southeastern corner of the State, and enjoyed a truly tropical climate, thanks to the great desert that surrounded it.

The Mineral Belt.

The mountain spurs along the western bank of the Colorado river are rich in the precious metals, and mining operations have been carried on there for many years. Besides extensive mines of gold and silver, lead, copper, iron and other valuable metals are known to exist, some of them in immense deposits, but as yet scarcely "prospected."

This rich mineral belt practically extends westward through the entire range of low desert mountains that divide the Mohave and Colorado deserts, but owing mainly to the diffidence of capital to enter a region bearing the name of desert, but little work of development has as yet been accomplished.

On most maps issued in late years there is given an apparently extensive river terminating in the Dry lake. This sometimes appears without a name, but usually it is designated as New river since it has only been known for a few years, and is supposed to have had its origin in overflows of the Colorado river which have occurred in recent years. Twenty years ago

The Colorado River

Wa in the habit of annually overflowing its banks during the time of summer freshets when the snows in the mountains around its headwaters melted. This overflow has not occurred since 1884 until the present year, I believe. There has thus been formed a channel through a deep and rich alluvial bottom, which received the name of New river from the earlier pioneers who crossed this desert.

Along the course of this New river the Indians planted and raised most magnificent crops on the lands which were overflowed, as they still do on the lands near the gulf where they have been compelled to retreat. Corn, melons, squashes and other vegetables and grain reached the rankest growth attainable, and those early pioneers yet speak with wonder of the success which these Indians met with in their agricultural labors.

Not only were the cultivated crops large but the natural vegetation along the New River section was equally rank. The grasses and weeds formed an almost impenetrable mass of vegetation—sunflowers became "small-sized trees," a grain of mustard-seed truly gave shelter to the birds of the air and the country very generally belied its name.

This overflow gradually receded into Dry lake, situated in the northern part of the great basin into which New river naturally drained, and there the water disappeared into the deep, porous soil and sand or quickly evaporated before the heat of a tropical sun.

The surface of Dry lake is of a fine sedimentary character, combined with an immense quantity of vegetable matter, consumed by dry rot and forming what may be called a "dry bog." The lake forms the lowest portion of the great basin, is 250 to 300 feet lower than sea level, and owing to the character of its surface, as above described, cannot be traversed.

Fossil Shells.

At Salton, a station a few miles farther east on the railway, the fresh-water shells are found in countless numbers on the surface of the plain, which evidently once formed the bottom of a lake. These fossils are all in a semi-fossil or semi-silicified condition, and are often drifted into windrows, where they may be scraped up by the quart. *Aurnicola longinqua physas, planorbis ammon* and *anodonta Californiensis*—the latter the common fresh-water clam of the Pacific Coast—are the principal fresh water shells detected among this shell debris, but the surface is strewn with these far to the southward to below the United States boundary line, along the course of New river. Probably the whole of the vast area outlined is below the present sea level, and portions are over 300 feet below—Salton being 250 feet lower than the Gulf of California.

The Old Beach-Line of this Ancient Lake

Or sea is well defined along the railway at the base of the mountains, and can easily be traced, always at the same level, for miles and miles along the eastern base of the San Jacinto and Chuckawalla mountain chains. The rocks are worn and rounded up to this line, sharp and ragged above. This line is even with the present sea level, which would seem to suggest that instead of having been a fresh-water lake, this was formerly an arm of the sea, and indicates that the Gulf of California once extended fully 200 miles farther to the northward than it does to-day. Further evidence tends to confirm this view.

Along the west shore of this ancient sea, as we shall call it (what is now known as the Colorado desert)—at present a vast alluvial plain so surrounded by mountains as to form a huge inland basin—there exist enormous deposits of fossils belonging (in my judgment) to the Miocene age. These are largely composed of oyster and allied shells, and extend from below the present sea level to an altitude of probably a thousand feet above. Some of these deposits are hundreds of feet in thickness, forming large mounds and low hills.

It is evident that the sea occupied this basin during the Pliocene epoch up to a late date, for fossils unquestionably belonging to this period are found on the desert, such as the marine *Ocinebra poulsonii* and the *Solecurtus Californianus*—both of which are found living to-day at San Diego. Dozens of the odd valves of the latter are found strewn on the surface of the ground at Salton, in an excellent state of preservation, and in the same semi-silicified condition as the fresh-water shells with which they were associated.

The remarkable point in this connection is the fact that these marine shells and the fresh-water snail-shells *were found associated together, in the same condition, and apparently belonging to the same geological age!*

The *Physa*, the *Planorbis*, the *Anodonta*, and probably the *Aurnicolas* also, are all to be found living to-day in the waters of the Colorado river—the same species whose external skeletons are so numerous and so freely strewn over the great basin.

The Desert and the Gulf.

It can be very readily understood that the sea must have occupied this basin within, geologically, very recent times. The cause of the separation of this ancient arm from the gulf is very apparent, and the same agency in the sediment from the Colorado river is constantly increasing the barrier between them. Doubtless this separation took place within the history of man, for the Indians still preserve the memory of catching fish along the base of the San Jacinto mountains in an ancient sea, and will point out to the stranger the traps or artificial walled-up pools where they caught the fish when the tides receded.

As I have already shown, it is evident that only a few years have elapsed since this whole expanse was a portion of the Gulf of California—a branch separated by a narrow strait since closed by the sediment and debris of the Colorado river. This is the only way by which I can at present account for the presence of the recent marine shells strewn along the edge of the Dry lake. The Colorado river, flowing into the isolated, shallow sea thus formed, soon changed it into brackish and ultimately to comparatively fresh water. The salt of the sea was precipitated by the evaporation that went on into valuable salt mines (that are now being worked), as the evaporation exceeded the inflow. Meantime the marine fauna had perished, except a few which were able to stand the brackish water—such as Solecurtus Californiensis being the last to succumb. The main branch of the Colorado hurried past to the gulf, and only the overflow, surcharged with the fine reddish sediment, reached the basin.

But this was sufficient to form a great depth of the finest and richest of alluvial soil along its route through New river to the Dry lake. Evaporation was rapid. Few years were probably sufficient after this basin was shut off from the sea and the main branch of the Colorado river flowed into the gulf before it virtually became what it is to-day, a barren, desert plain, which occasional overflows are able to convert into a garden of tropical luxuriance.

The Colorado's overflowing its banks doubtless resulted in such a condition of affairs as Dr. R. E. C. Stearns suggests—a system of shallow lagoons just adapted to the multiplying of the pond and river snails from the Colorado. These lagoons must have been of sufficient duration to allow of the maturing of the fresh-water mussel, and still they may have been dry a good portion of the year, as is now the case.

An Inhospitable Region.

Leaving the discussion of the geological problems that confront us to some more convenient time, we will return to the present. It is truly something fearful to contemplate these scorching plains as they exist to-day, with the sun beating down upon the drifting sands with an intensity of heat that often raises the temperature to 130° or even 140° F.

Woe to the adventuresome spirit that ventures unadvisedly at such a time as this upon the stony trails leading into this inhospitable region. Many a man has left his bones to bleach in the clean, white drifts of sand, and the skull of one of these unfortunates rests within my museum as I write. And how many others have left their earthly tenements to decay in poisonous springs of alkaloid or other mineral water, after quaffing their last welcome but fatal drink! Only the coyote and the scorching winds can tell.

Still, many more stand ready to take their chances in the insatiable greed for gold—gold, which if found, might only prove more deceitful than the false mirage—only tempting them on to both temporal and everlasting ruin.

Oh! what beautiful visions arise to the weary eyes. What entrancing landscapes lie spread out before the traveler. Lovely streams of water seem dancing over sands of gold, and placid lakes surrounded with trees and palatial residences invite the unwary to their destruction. What hopeless agony must the poor deluded victims suffer, when, with staring eyes and lolling tongue, they realize too late, and sink to their last rest upon the burning sands. Perhaps, however, they are spared the pain of realization. Let us hope so at least. The hundreds of beautiful variations assumed by this natural phenomenon have often been described, and to one in safety are ever a source of pleasurable wonder and speculation.

Wild Flowers.

There is another side, however, to the picture we have drawn—one more pleasing to contemplate, though it may seem to the uninitiated scarcely less visionary than the optical illusions just mentioned. In early springtime—if there has been sufficient rain, as is *sometimes* the case—these plains are transformed into a vast garden of the choicest flowers in innumerable variety. Every color of the rainbow is imprinted on the smiling faces about you, and the traveler may roam at pleasure among the imperial beauties of a fairy queen's throne-room.

The stately day lily nods its head familiarly to the multitude of humbler flowers that have sworn it allegiance. The foot treads over carpets of vari-colored Gilias. The butterfly tulip startles the eye with its brilliancy, blue-eyed Phacelias, beds of the Golden Eschscholtzia, and numberless other flowers in every form and coloring challenge attention.

The wild fruits and native productions of a country furnish to the thoughtful observer a slight index to its capacity for the production of other fruits and flowers. If capable of growing in a favorable season such wealth of floral beauty, is not this so-called desert capable of better things? If flowers that are destined to "bloom and waste their sweetness on the desert air, and blush unseen," find congenial surroundings here, may we not believe that man may transplant others for his use and delectation?

Palm Trees.

The traveler on the Southern Pacific railway may observe something dark and indefinable against the barren and distant hills near Indio. On investigation this will prove to be a forest of thousands of wild palm trees, the fine Washingtonia filifera, which has become so characteristic of Southern California gardens. Here they grow naturally in the greatest luxuriance, some attaining an estimated hight of over 100 feet. Thousands of others exist in the deep and rugged canyons, where they assume proportions as yet unequaled anywhere by this favorite Californian fan palm where it is in cultivation.

The presence of these trees here in their

thriving condition naturally suggests the adaptability of the country for the date palm, which, I believe, is destined to prove an important factor in the future development of this region. The wild palm has provided past generations of Indians with the means of existence in its small, sweet, black fruit; the date may support many future generations of our own race. Its success can scarcely be doubted in the face of experience with the date in Southern California and Arizona.

Irrigating Arid Lands.

No greater problem is before the American people to day than how they shall treat our arid lands. All portions of the arid regions of the West are capable of the highest degree of cultivation. The key of the situation is irrigation. No part of the vast area termed arid in the West will prove more susceptible to kind treatment than the now feverish, parched, dreary waste—exceeding 5,000,000 acres in extent—designated on modern maps as the Colorado Desert.

California, formerly famous for her wealth of gold, and now equally and justly famed for her excellent fruits, has no more important possession than this neglected southeastern corner, which some day will greatly enhance the fame of our beautiful State.

Future generations may see it become one of the most densely populated and wealthiest sections in the State. Here the date, the banana, the mango, and all the luscious fruits of Asia, Australia and tropical America will flourish as nowhere else within the present limits of the United States.

To review, even briefly, the natural resources, the mineral wealth, the questions of geological moment, of climate and the great horticultural possibilities of this region, would consume a good-sized volume, but I hope the rural population of California may gain a better idea of this portion of the nation's arid lands, and not be entirely ignorant of its existence within our boundaries.

THE TWENTY-FIFTH
INDUSTRIAL EXPOSITION
— OF THE —
MECHANICS' INSTITUTE, 1890,
Opens Sept. 18th, Closes Oct. 25th,

With a grand display of Inventions, Manufactures and Art. The Latest Novelties and Improvements in Electricity will be made a special feature, including the celebrated Edison "Tower of Light." The Music will consist of a band of 42 talented musicians, supplemented by the best Vocal Talent obtainable. Miss Matbilde Lennon, a noted Contralto Singer from London, and late from Boston, has been engaged, as also Miss Pearl Noble, the accomplished young Californian Cornetist. The Art Gallery, 200 feet long and 50 feet wide, will be filled with rare and beautiful works by local and foreign artists, in oil and water colors. Photography will be shown in the most attractive form by Professionals and Amateurs. Machinery of all kinds will be in operation, and many novelties exhibited for the first time.

Admission:
Double Season Tickets, $5.00 | Single Adult Admission, 50c
Single Season Tickets, 3 00 | Children.....25c
Season Tickets to Members of the Institute, Half-Rates.

THE IRRIGATOR.

The Tulare Convention.

The telegraphic reports bring an outline of the proceedings of the Irrigation Convention at Tulare last week, which we give below, reserving the right to give fuller allusion to special branches of the convention's work as fuller reports come in :

TULARE, Sept. 12.—The State Convention of the irrigation districts of California met at Tulare to-day. Delegates were present from 14 districts—about half in the State. Many prominent friends of the district system, not district officers, were also present, and have taken an active part in the proceedings. Among others were O. C. Wright, author of the present law, and I. R. Wilbur of San Francisco.

The association was organized permanently by the election of J. R. McDonald of the west side of the San Joaquin president, and J. E. Anderson of Poso secretary, E. Oakford, Tulare, assistant secretary.

The sentiment prevails that while the law needs amending in several particulars, its principles are right, and it is along that line that the battle is to be fought out.

A Legislative Committee of five was appointed, to be aided by an Advisory Committee of one from each district in the State, as follows :

E. H. Tucker, W. S. Green, C. C. Wright, L. M. Holt and J. W. Nance.

Evening Session.

Upon motion the convention proceeded to the organization of a State Irrigation Association, to be composed of one representative from each district. Following is a list of names submitted : Perris district, J. W. Nance; Central district, H. B. Eakles; Selma district, Wm. A. Caruthers; Anaheim district, Thos. Spencer; Vineland district, I. N. Rhodes; Modesto district, Frank Cressey; Elsinore district, J. C. Chambers; Alta district, P. Y. Baker; Kern and Tulare district, E. D. Morton; Big Rock Creek district, J. S. Wilson; Escondido district, R. R. Beavers; Poso district, B. C. Dorsey; Murietta district, H. S. Mason; Tulare district, E. De Witt; Palmdale district, S. P. Cull.

L. M. Holt introduced the following on irrigation data and statistics :

Irrigation District Data.

The following data regarding the irrigation districts of the State have been carefully prepared from reports from the secretaries of the various districts. Seventeen districts have made reports, of which number 12 have voted bonds, and these 12 are given in the annexed table. Some 10 or 12 districts have made no report.

The following table shows the returns from 12 of the irrigation districts of California, giving number of acres, amount of bonds voted, amount of bonds sold, and the amount of bonds per acre in the districts that have voted bonds.

District and County.	Number of Acres.	Bonds Voted.	Bonds Sold.	Bonded Debt Per Acre
Escondido, San Diego	12 814	$450 000		$35 12
Big Rock Creek, Los Angeles	30 400	500 000	$150 000	13 16
Vineland, Los Angeles	4 500	150 000	50 000	14 21
Anaheim, Orange	32 500	600 000	300 000	23 46
Palmdale, Los Angeles	50 000	175 000		3 50
Modesto, Stanislaus	81 500	800 000	117 000	9 85
Browns Valley, Yuba	43 000	110 000	80 000	2 54
Turlock, Stanislaus and Merced	166 316	600 000	310 000	3 40
Central, Colusa	156 550	750 000	225 000	4 79
Tulare, Tulare	36 707	500 000		13 94
Madera, Fresno	305 000	850 000		2 78
Alta, Fresno and Tulare	129 927	675 000	414 000	5 20
Totals	1 050 244	$5 960 000	$1 672 000	
Average				$6 62

It will be seen by this summary of reports that the 12 districts contain 1 059,244 acres of land. That their bonded indebtedness as voted amounts to a total of $5 960,000, and that of this amount of bonds $1,672,000 have been actually sold. Of this sum, $560,000 in bonds were exchanged for water and water rights at par, and the sum of $1,142,000 in bonds was sold for cash at prices ranging from 90 to 96 cents on the dollar. The average amount of bonded indebtedness to the acre amounts to only $5.62. Four districts out of the 12 have sold no bonds. The bonds voted by these districts amount to $1,975,000. The other eight districts have voted to the extent of $3,985,000, of which $1,672,000 have been sold.

Second Day.

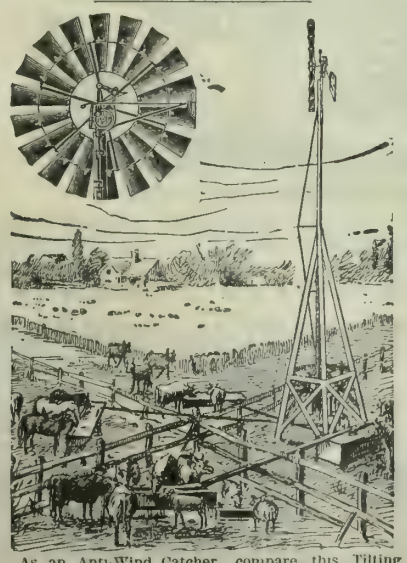
TULARE, Sept. 14.—The convention of irrigation district officers, which convened at Tulare yesterday, concluded its labors last night and the delegates left for home. The session has been extremely interesting throughout and completely successful.

A permanent association of irrigation districts was formed with J. W. Nance of San Diego county as Pres.; E. De Witt of Tulare, Vice-Pres.; A. J. Pillsbury of Tulare, Sec'y; Tulare County Bank, Treas. A board of five trustees, consisting of J. W. Nance of Perris district, E. De Witt of Tulare district, J. S. Wilson of Big Dry Creek district, Los Angeles county, and H. S. Maron of Murietta district, San Diego county, was chosen to transact the association's business when it is not in session.

By-laws were adopted and machinery perfected for concerted action in the work of organizing the districts, having doubtful points passed upon by the courts, securing needed legislation and placing district bonds. The sentiment was general that the formation of the association would be productive of very important results. The following resolutions were adopted:

WHEREAS, The people of California have won a valuable victory in securing the enactment of the Wright Irrigation District law; whereas, the Supreme Court has declared that the said law is in conformity with the organic law of the State; whereas, eight irrigation districts which voted bonds of $3,985,000 have succeeded in finding a market for nearly half of the issue ($1,672,000), selling bonds for cash for 90 to 96 cents on the dollar of their par value; whereas, the enemies of irrigation districts are still using money to defeat that law not only in the courts, but by threatened appeal to the next Legislature; whereas, we firmly believe that the salvation of the State and the best interests of the people demand that the Wright law should be sustained and perfected; whereas, a united and determined action on the part of the friends of irrigation is essential at the present time; therefore, be it

Resolved, That the people have confidence in the Supreme Court, which has stood by the irrigation laws in the face of bitter attacks, declaring them right, just and in conformity to the Constitution of the State.



Resolved, That we believe the financial success of irrigation bonds is now assured, and we congratulate the people on the fact that moneyed men are seeking these bonds as safe investments that have their foundation in the homes of the people, and are not jeopardized by strikes, railroad wars or other matters incidental to railroad bonds.

Resolved, That we pledge ourselves to each other that we will, regardless of political affiliations, support no man for office who is not known to be unqualifiedly in favor of the Irrigation Act, and in favor of its perfection in the spirit in which it was enacted.

Resolved, That we heartily approve the organization of a State association of irrigation districts, and that the work of such an association will not be completed until every acre of dry land in the State shall have been successfully irrigated, and every bond issued in such irrigation work shall have been honestly paid, principal and interest.

San Bernardino (28th Dist.) Oct. 21–25.

As an Anti-Wind Catcher, compare this Tilting Tower and its Aermotor with an ordinary Windmill and you will find that it presents but a tithe of the wind surface to the grasp of the storm that the other does.

NURSERY STOCK WHOLESALE.—Hooper, Bro. & Thomas of the Maple Avenue nurseries, West Chester, Pa., have issued their semi-annual trade-list—a neat 16 paged pamphlet—for nurserymen, florists and dealers only.

THE attention of sheep and cattle-owners is called to the advertisement on page 261 of Chloro-Naptholeum, a non-poisonous sheep dip. Its cheapness and efficiency certainly commend it to all interested in domestic animals of all kinds. It is also a disinfectant of superior merit.

State Fair Notes.

[Written for the RURAL PRESS by F. S. C.]

The Colusa County Exhibit

Although your correspondent has explored every crack and corner of Colusa over and over again in the line of duty, he never before realized its variety and wealth of resources as when viewing the large and tasteful exhibit prepared under supervision of Mr. W. H. Jones.

He began by testing the mineral waters from Cook & Fout's Springs. Then came decorations of olives and palms. Corn was there from the ranch of Senator Boggs, with ears eight feet from the ground. Fancy the owner standing on tiptoe on the back of a horse trying to pluck a roasting ear and you will gain an idea of that corn-field. Mr. C. C. Felts of Maxwell shows samples of wine from his famous vineyard that look well—but further, deponent saith not. Brust Bros. of Brustdale show Bloodgood pears at least twice as large as we have been accustomed to see.

Mr. Newlands shows fine almonds; sheaves of wheat form the background of the decorations.

L. F. Moulton shows a great variety of dried fruits and sample of sorghum of which he is beginning to make something of a business.

The Colusa Canning & Drying Co. shows almost all varieties of dried fruits and a great variety of canned goods. This is an industry organized last year, and now grown to such dimensions as to employ 100 hands. They have started to build up a permanent reputation for their county by selling goods exactly as represented, consulting the consumer's interests in packing, and wherever goods are sold prominently displaying a card inviting correspondence relative to quality of goods and demands of consumers. Last year's goods brought many commendations, and this year's pack is selling in advance.

Mr. Catlett shows blackberries wonderful in size.

Chas. Richter, fine samples of White Smyrna figs.

H. H. Harlan, fine display of Angora rugs dyed in fancy colors. T. H. Harlan and Julius Weyand, both prominent breeders of Angoras, show fine display of mohair.

Gustav Weyand shows white wine in beautiful bottles.

J. Rathbone has proven himself quite a prospector the past summer by the discovery of a very fine quality of petroleum flowing from the surface of the ground in the mountainous section in Southwestern Colusa. He has also established salt works on the ranch of Peter Peterson near Sites, and shows some crystal salt of remarkable strength and purity. The writer has seen it bubbling from springs as clear as crystal, and seen it glistening and sparkling in the sun as tons of it lay near the vats at the works.

"Beats grow beets." This was suggested by the gentlemanly exhibitor when calling attention to a 60-pound beet raised by inmates of county hospital. No doubt the beet was raised where some are beats; but is it too much for our charity to look upon the condition of the majority of those as the beaten in life's race?

G. W. Hicks shows tobacco, and Mr. Hennica of Indian Valley shows the genuine rope hemp.

In a large display of vegetables are some watermelons weighing 90 pounds each.

J. B. DeJarnatt of Colusa shows some Indian Cling peaches, 3½ inches in diameter.

J. D. Rosenberger shows pears of remarkable size, called the Lady Isabella, measuring 14 inches in circumference one way and 16 the other. Mrs. Sam Gilmour of Grimes Landing showed very fine pomegranates. Borden & Burkey show a fine display of vegetables, among them egg plants 36 inches around and peppers to delight a Spaniard's heart.

In the mineral collection appears a sample of gold quartz assaying $200 per ton from the Clyde mine, and some hydraulic cement from Smithville, which attracted our attention. Forty-four different kinds of wood are shown, and it was not much of a day for varieties of wood, either.

G. W. White shows fine samples of honey.

A Fuel Saver is shown by G. W. Farnham of Germantown. It is an invention that he used at home many years before bringing it out. The point is to prevent heat and smoke from going up chimney and still preserve a good draft. Many were sold at Colusa last winter, and buyers generally estimated that it saved from a fourth to a half the fuel. If it saves a tenth in these days of high prices it is of great benefit. Mr. Green of Colusa *Sun* gave it credit for saving from fire the house of a prominent citizen last winter.

Sylvester's weed-cutter is an arrangement for running a strong knife under the surface, not permitting a weed to escape. Then comes a heavy wire rake with an easy dumping apparatus. In cleaning morning-glory, quack grass, or any other that propagates from runners under ground, you gather them all up in winrows and burn them. In raking grapevines or cornstalks you remove the cutter and have just the strong, easy-dumping rake you need. The implement is as strong and easily handled as a good gang plow, and is not only the thing for orchards and vineyards, but the very tool for clearing summer-fallow from weeds.

Colusa's show at the park begins with Peterson's herd of 20 Shorthorns, equal to any on the grounds in beef points, and at the same time showing remarkable milkers. The uniformity of the herd attracts the attention of all, and it is the general verdict that they were never before shown in so good condition. They expect their share of blue ribbons.

Thomas H. Harlan of Colusa shows 25 very fine Angoras. Constitution, luster and fineness, and length of staple are the points Mr. Harlan is breeding for, and the appearance of the goats shows long and careful breeding in these directions. He has a very large band at home and inquiries for young stock are active.

J. D. Rosenberger of Sites shows four fine jacks as a sample of 13 he has at home.

Cooper of Colusa is showing some saddle-horses nicely gaited, and makes a specialty of single-footers. If any have been omitted it was because the writer was hurried with too many demands upon his time, and he hopes to make peace later on. Mr. W. H. Jones received as he deserves general commendation for the extent, excellence and taste of his display.

The Sacramento Display.

This has been superintended by A. A. Krull, who has spent a large part of the summer in making and arranging the display. Among other things, he has collected some 200 specimens of grasses from both sides of the river.

The Natoma Vineyard makes a very fine and large display of table and wine grapes.

W. S. Manlove shows a large variety of fruits, making shipping grapes a specialty.

Mrs. J. T. Olbert makes a very large and fine display of pickles and preserves.

Robert E Greer of Fruit Ridge, near Sacramento, shows a large assortment of fruits of fine quality, all raised without irrigation.

Mrs. Shields of Routier makes a large display of fruits, covering a table 20 feet long.

Mr. Krull collected from the whole county specimens of fine fruit and preserved the same in glass jars. Of these, he made the base of a statue surmounted by a large figure of Pomona. Ceres had a similar representation of the grains of Sacramento, and Flora stood upon a magnificent display of flowers from the Bell Conservatory. It would have made a fine impression if we could have had such a display in the hall where they were received.

The Soap Works show great blocks, like building stones, made from their goods, and two of the columns are surmounted by very lifelike busts of Henry Clay and Daniel Webster.

Senator Johnson shows a fine refrigerator filled with fancy Jersey butter.

Miss Anna McConnell shows a fine display of fancy work.

There are many curiosities in shells.

The ladies show bread, cake and various triumphs of the culinary art enough to feed an army.

Joseph Sims shows a collection of fruits.

Galt's display is being arranged by Mr. McFarland. He has already in place cheese, fruit, grapes, etc., and from space occupied, evidently intends to have a very creditable showing for his section.

Mrs. Muddox makes a great show of pickles and preserves.

Mr. Geo. Muddox shows goods from his store consisting of sewer and water-pipe and a general line of pottery-ware.

The veteran hop-growers, Daniel Flint and Mr. McGregory, show samples of remarkably large and fine hops, both on the vine and in the bale.

J. H. Butler of Florin shows the pomelo or citron.

A pyramid of cotton and corn is mounted by an immense squash with a sunflower overhanging.

Castor beans make a tree for poultry to roost upon, three inches through at the base and 16 feet high. This was raised by Mr. Elder of 21st and J streets.

A large block of building stone shows important natural resources.

Mrs. Krull and Mrs. Flint show a very tasty stand of fruit and flowers.

The merchants of Sacramento make many large exhibits. Among them we noticed the sheet-iron miniature house of Huntington & Hopkins and their show of hardware.

At the Park, Eaton and Smith of Florin each shows a fine herd of Jerseys. P. Stanton of Brighton shows another herd.

Dr. Nixon shows the Argonaut herd of fine Polled-Angus cattle. J. E. Camp of Perkins shows the American River herd of the same breed. Besides the 13 head shown, he has three pure bred and 70 grades at home.

Time fails to notice horse and poultry departments of the Sacramento display. Before this she has refrained from competing for the premiums for county displays, and this year shows them what she can do.

California's Stallions.

I beg to announce that, with a view of perpetuating the forms and characteristics of the leading stallions of California, I am issuing a series of lithographic likenesses. Each portrait issued will be an acknowledged likeness, the result of a close study of the horse and an artistic treatment of the subject. In order to secure for the series an immense advertising value, from a breeder's point of view, 4000 copies, at least, of each portrait will be issued.

Terms, $100 for first issue of 100 copies. In quantity, for advertising purposes, copies will be furnished at low rates.

H. BOYD, Artist.
268 Golden Gate Ave., San Francisco.

Breeders' Directory.

Six lines or less in this Directory at $4 per line per month.

HORSES AND CATTLE.

JOHN LYNCH, Petaluma, breeder of thoroughbred Shorthorns. Young stock for sale.

We have 19 head of Imported Stock.
Young Bulls and Crossbreds on Devons for sale.

H. MECHAM,
Importer and Breeder of Shropshire Sheep
They were all imported from England in '83, or bred direct from Imported Stock, and all registered.

H. MECHAM,
—BREEDER OF—
American Merino Sheep Without Horns.
The only flock in the United States. When we bought our sheep East 20 years ago, among them was a ram without horns. He grew to be a large fine sheep, shearing at 2 years old, a 12 months' fleece, 35 lbs. of long white wool.

I have bred from him and his get ever since and have never made an out-cross and never used the same ram but one year on the same flock. My rams at 2 years old will weigh from 160 to 180 lbs.; have a strong constitution, without wrinkles, and will shear on an average about 25 lbs., a 12 months' fleece, of long white wool. Rams and Ewes for sale. **P. O. Address:**

S. F. Market Report

Market Review.

DOMESTIC PRODUCE, ETC.

SAN FRANCISCO, Sept. 17, 1890.

Trading the past week in farm products was quiet at generally steady figures. Cereals exhibited continued strength in barley and corn, but oats and wheat were easier. At the East, and also abroad, wheat shaded off under a decline in silver and a money stringency bordering on a panic brought about by a scare regarding the new tariff bill becoming a law and going into effect on October 1st; more time being required by importers and business men in general to adjust their affairs to the new order of things. The following is to-day's London cable:

LIVERPOOL, Sept. 17.—Wheat—Quiet. California spot lots, 7s 2d to 7s 4d; cargoes off coast, 37s 3d to 37s 6d; just shipped, 37s 6d; nearly due, 37s 6d; cargoes off coast, steady; on passage, quiet but steady; Mark Lane wheat, quiet.

Foreign Grain Review.

LONDON, Sept. 15.—The London *Mark Lane Express* says: Glorious weather prevails. The farmers have secured their wheat and much of their oats. Barley is in excellent condition. All the cereals are frequently rather over the average in yield per acre. The quality and condition is probably average. Old English wheat during the week was scarce. New ranged at 32s to 38s. The foreign trade was against the holders in the first half of the week, but the United States official report caused a reaction. Oats and maize are weaker. At to-day's market of English wheat, buyers were less eager, confident of an easing. Foreign wheat is irregular. Flour is firm. Oats are stronger under prospect of a diminution of winter supplies. Maize—Russian advanced 3d and was hardening. Round Maize is quoted at 22s 6d; flat, 23s; yellow, 20s. Rye is dearer.

Liverpool Wheat Market.

The following are the closing prices paid for wheat options per ctl. for the past week:

	Sept.	Oct.	Nov.	Dec.	May.	Jan.
Thursday	7s4¼d	7s6d	7s6d	7s6½d	7s6d	7s6d
Friday	7s4¼d	7s5¾d	7s6d	7s6½d	7s6d	7s6d
Saturday	7s4¼d	7s5d	7s5¾d	7s6¼d	7s6¼d	7s6d
Monday	7s4¼d	7s4½d	7s5½d	7s6d	7s6d	7s6d
Tuesday	7s3¼d	7s3½d	7s4¼d	7s5d	7s5d	7s5d

The following are the prices for California cargoes for off coast, nearly due and prompt shipments for the past week:

	O. C.	P. S.	N. D.	Market.
Thursday	37s6d	37s6d	37s6d	Firm.
Friday	37s6d	37s6d	37s6d	Firmer.
Saturday	37s6d	37s6d	37s6d	Quiet.
Monday	37s	37s6d	37s6d	Quiet.
Tuesday	37s7d	37s6d	37s6d	Easier.

Eastern Grain Markets.

The following shows the closing prices of wheat in New York for the past week:

Day.	Sept.	Oct.	Nov.	Dec.	May.	June.
Thursday	106	107	108¼	109⅝	113⅝	...
Friday	105¾	106	107⅝	108⅜	113⅝	...
Saturday	104½	105	106⅜	107⅜	112	...
Monday	103⅝	101⅝	....	104⅜	108⅜	...
Tuesday	101⅜	102½	104	105¼	109⅝	...

The closing prices for wheat have been as follows at Chicago for the past week:

Day.	Oct	Dec.	May.	June.
Thursday	104	106½	110¼	...
Friday	103½	105⅝	110⅝	....
Saturday	101⅞	104⅛	108⅛	...
Monday	98¾	101	105	....
Tuesday	99	101⅜	106	....

CHICAGO, Sept. 17.—Wheat—$1 04¼ for October, $1.02½ for December and $1.07 for May.

NEW YORK, Sept. 17.—Wheat—$1.03½ for cash, $1.06⅛ for December and $1.10½ for May.

Eastern Wool Markets.

BOSTON, Sept. 12.—Wool is firm. Further large sales of Territory wool have been made at 58@60c for fine; fine medium, 55@58c; medium, 52@55c; California 17@24c, as to quality. Oregon wools are dull.

NEW YORK, Sept. 12.—*Bradstreet's* says: There is noted a better feeling in the wool market. The buying is confined largely to worsted and dress goods mills. The most noticeable movement is in Montana and other good staple Territory wools. There have been several reasons assigned, but the principal one is the expectation that the tariff question will soon be settled. Ohio and Michigan combing wools are very firm under a decrease in quantity. The past week has developed considerable inquiry, especially in Texas and carpet wools. The clip will fall far below that of last year. It is expected that from now on there will be an improvement followed by a gradual rise in prices.

Hops.

NEW YORK, Sept. 14.—*Bradstreet's* this week says: Estimates vary as to the probable total output of domestic hops this year, but that given out by Messrs. Rothbarth & Sons is that the aggregate will not exceed 165,000 bales, which is 2000 bales less than the lowest estimate of the total domestic hop crop in 1889. If the increasing demand for malt liquors be followed by a corresponding gain in the request for hops, the aspect of affairs becomes of interest. The old hops remaining here are all in brewers' hands, possibly 40,000 bales. If the home crop amounts to 169,000 bales, and the output of beer equals 29,000,000 barrels, the consumption of hops being only one pound to the barrel, the available surplus would be about 55,000 bales. At least, this is the brewers' point of view.

Again, it should be stated that exporters have already engaged freight-room for 25,000 bales to go to England within two months, and the export demand will undoubtedly call for more than double that quantity before the end of this crop year. In England, mold and mildew have stricken the plants and the outlook is described as gloomy. The production there is variously estimated at from 180,000 to 280,000 hundredweight of 112 pounds each. Perhaps it will equal 240,000 hundredweight, but the quality will be poor. The consumption in England is between 600,000 and 700,000 hundredweight, and the English deficit will therefore amount at least to 250,000 American bales. The French, Belgian and Dutch hop crops will be short this year, and in Germany the crop will not exceed two-thirds of that in 1889. This points to the likelihood of Germany's not being able to export much to exceed 100,000 hundredweight during the coming year, as compared with the annual exports for five years past, amounting to 300,000 hundredweight.

These data all lead up to one very important point. Germany and the United States will have enough hops for their own requirements, but in the light of the present information concerning the hop crop in England, not enough to supply the shrinkage in the English hop crop. If the indications are well founded, higher prices for hops would appear to be reasonably certain.

LONDON, Sept. 16.—The English hop crop is revealed by general picking, which is fairly under way, to be poor.

NEW YORK, Sept. 16.—English advices say English hop-dealers are trying to bear the hop market. It is known here that old hops are selling there at a handsome premium, the price in some instances reaching £7.

BAGS—The market has ruled dull and heavy for standard-sized bags. There are sellers at 7⅜@7⅝c.

BARLEY—The market has fluctuated slightly for both cash and future delivery. The receipts continue free, but no accumulation in stocks is reported, notwithstanding the light export demand. In futures, trading has been fair. The following are the sales reported on to-day's Call:

Morning Session: Buyer season—300 tons, $1.45¾ ₱ ctl.

BUTTER—The market for gilt-edged is quite firm. Large dealers do not express much confidence in the market, fearing that with cooler weather Central State creamery will come in more freely than can be cared for. Pickled butter is moving off fairly free, as is solid packed. California creamery is in good demand. Some creamery from Wisconsin, choice grades, came in the past week and sold at 23@24c in tubs.

CHEESE—The market is dull and heavy. At the recent advance large distributors ordered from the Central States, and having to buy in carload parcels so as to get low freights, they are now well supplied.

EGGS—Choice, fresh laid of good size can be placed at 37½c, possibly a shade higher; but other California eggs—those that are greasy and which will rattle or shake—are sold at the same price obtainable for Eastern.

FLOUR—The market is easier, with large buyers able to get concessions.

WHEAT—The market has been unsettled, owing to export buyers being out of the market except at concessions. Their withdrawal was due to a money stringency at the East and also a decline in silver. The stringency caused many speculative holders at the East to realize, which was taken advantage of to lower prices. The decline in silver caused exporters to fear free offerings of Indian and Russian wheat. In futures, trading has been light. The following are to-day's reported sales on Call:

Morning Session: Buyer 1890—400 tons, $1.39⅜; 300, $1.39½; 200, $1.39⅜. Buyer season—200 tons, $1.47¾ ₱ ctl. Afternoon Session: Buyer 1890—600 tons, $1.39; 200, $1.38⅞; 300, $1.38¾. Buyer season—300 tons, $1.47½; 400, $1.47¼ ₱ ctl.

[COMMUNICATED.]

Market Information.

Produce Receipts.

Receipts of produce at this port for the week ending Sept. 16th, were as follows:

Flour, qr. sks	70,691	Middlings, sks	4,027

Cereals.

Dornbusch, a well-known London circular, says: Considering the scarcity of old wheat in Russia, the shipments from Black Sea and Azov ports continue liberal, those in the week ended 9th inst. amounting to 188,720 qrs. The total exports from July 1, 1889, to June 30, 1890, were 90,492,376 bu., in comparison with 109,146,816 bu. in 1888–89, and 102,862,704 bu. in 1887–88. The present cereal campaign is beginning with the reserves of former crops almost exhausted, and were it not that the area under wheat this season is considerably larger than in previous years, the export trade would be seriously curtailed.

A late report says of the Danubian crop, which is the greatest competitor of America, that on August 16 the crop on the left of the Danube had suffered from the drought and in places was quite parched up. Right of the Danube, owing to the uninterrupted great heat of nearly six weeks, the fields were in very bad condition, and only a medium or under medium crop could be expected. Right of the Theiss the corn was almost everywhere backward through the prolongation of heat, and was generally in weak condition.

Foreign crop reports were favorable. Latest advices from Austria-Hungary are: There is no improvement in the condition of the corn crop in this country, but the estimates concerning wheat are very rosy. One Pesth journal puts the yield in Hungary at 160,000,000 bushels, which would mean as the home consumption is 88,000,000 bushels, and Austria requires about 40,000,000 bushels, that about 32,000,000 bushels would be available for export; still another advice estimates the surplus as 56,000,000 bushels. Judging from the latest official report as to the condition, the yield cannot be over 152,000,000 bushels, while that in Austria may reach 48,000,000 bushels. The surplus for export may be judged by the following figures of previous crops and exports:

	Crops, bu.	Exports, bu.
1887–88	193,600,000	16,800,000
1888–89	187,248,000	26 400,000
1889–90	128,240,000	10,000,000
1890–91, estimated	200,000,000	28,000,000

A point which is often overlooked is the decrease in the American crop of wheat in the past ten years and the increase in consumption. A few figures will show this fully.

	1880–84.	1885–89.	Changes.
Average crop	463,953,000	485,418,000	Dec. 28,535,000
	1880.	1890.	Changes.
Crop	498,550,000	415,000,000	Dec. 83,550,000
Consumption	233,000,000	301,000,000	Inc. 68,000,000

The local wheat market was dull throughout the week, with buyers bidding lower. Sellers, as a rule, are reported to be warehousing rather than place their holdings at present bids. The scarcity of ships is against the spot market, but as the tonnage on the way is quite large, it is only a question of time when charters will be lower and export buyers be in the market. The decline in silver is against American farmers. It is quite evident that we will not have any stability to and higher prices for silver until we remonetize the metal by passing a free-coinage bill. In the Central States, and also in portions of this State, farmers will vote only for Congressmen who will under any and all circumstances vote for a free-coinage bill. If farmers do not look after their own interests, others will not. The recent advance in silver made quite an advance in Russian and Indian wheat laid down in England and other importing countries, and with the metal at par, a little over $1.29¼ an ounce, the cost would be still greater, which would cause American wheat to be correspondingly higher. A London telegram dated Sept. 11 says: "A veritable panic prevails among the South Russian grain exporters, owing to the unprecedented rapid rise in the value of rubles (silver money). The whole Russian export trade is demoralized. Though the harvest was good, no doubt the season will close with a general crash. Two Southern exporters have already failed." The exporters sold cargoes for delivery in England and the advance in silver caused the wheat to cost more laid down in the latter country than the price at which they had contracted to deliver.

Barley has shaded off under free receipts and a lessened demand. Threatening weather, with a general expectation of early rains, are against the market. The exports so far this season show a decided falling off. The supply is, beyond a doubt, short of our requirements up to June, 1892, yet prices are considerably in advance of last year's ranges.

Oats are heavy under free receipts from Oregon and reports of liberal supplies to draw from. The impression prevails that with free shipments to this city, prices will recede.

Rye is fairly steady at unchanged quotations.

A good shipping demand for Central America and Australia has advanced prices for yellow corn. The supply of old is light. It is difficult to obtain correct estimates regarding the probable outturn of this year's crop, and until we are able to give them, it is useless to express an opinion regarding future prices.

Feedstuff.

Ground feed is in good demand, with an advance quoted in both bran and middlings, Ground and rolled barley is stronger, with a good demand ruling.

Hay continues firm at full prices. Receipts are not large, while the demand is good. There is a slightly better shipping inquiry. Choice grades of hay are reported scarce.

Fruits.

All kinds of melons are dull and in oversupply; cool weather being against the market.

Peaches, pears, plums, figs, etc., as is usual at the tail end of the season, are dull with prices barely sustained. Canners are running chiefly on tomatoes, which makes other fruits more quiet.

Grapes are weak for table and canning, but wine grapes are advancing under a good demand in sympathy with better prices for wines. The large quantities of wine grapes dried are in favor of still better prices for the fresh.

Apples are coming in quite freely. There is an increasing demand for export. The more choice good keepers are wanted.

For raisins there is a good inquiry. Buyers appear anxious to keep prices down. It now looks as if we can market all of our surplus, large as it is, at good prices before December 1st. Large packers will sell before the holidays, fearing to carry over into 1891.

Dried apricots are getting scarce, owing to heavy shipments to the East. Free shipments are being made to the East of dried apricots, prunes, pears, and peaches. Nectarines are well cleaned up. Wholesale merchants in this city are not carrying large stocks of dried fruits, fearing that the high prices will restrict consumption.

Vegetables.

Garden truck is reported essentially unchanged.

Marrowfat squash are easier, although not quotable lower. Receipts are increasing.

The overland shipments of potatoes and onions during last month were quite heavy.

Onions are steady, with a strong tone reported. Receipts are barely equal to the demand.

Potatoes are weaker under heavy receipts. Both the shipping and home demand is quite active. The partial failure of the crop at the East is in our favor.

Live-stock.

Bullocks are offering quite freely. Mutton sheep are firm at higher prices. The offerings are said to be light. Hogs are easier under liberal receipts. In milch cows and horses there is nothing new to report.

The market for dressed cattle is quoted as follows [to obtain the price on foot, take off from the price for stall-fed one-third to one-half, according to the nature of the feed and time fed; and for grass-fed take off the price from 40 to 60 per cent]:

HOGS—On foot, light grain fed, 4¼@4½c ₱ lb; dressed, 7¼@8½c ₱ lb.; heavy, 3½@3¾c ₱ lb.; dressed, 5¾@6¼c ₱ lb. Stock hogs, 4¼@4½c ₱ lb

BEEF—Stall fed, 6½@—c ₱ lb.; grass fed, extra, 6@—c ₱ lb.; first quality, 5¼@5½c ₱ lb.; second quality 4¼@5c ₱ lb.; third quality, 4c@— ₱ lb.; bulls and thin cows, 2@3c ₱ lb.

VEAL—Small, 6@8c ₱ lb.; large, 4@6c.

MUTTON—Wethers, 7½@8c ₱ lb.; ewes, 7@7½c ₱ lb.; lamb, spring, 9@10c.

Miscellaneous.

From the *Commercial News* of Sept. 15th the following summary of tonnage movement is compiled:

	1890.	1889.
On the way to this port	286,348	234,718
On the way to neighboring ports	21,478	18,893
In port, disengaged	4,829	23,472
In port, engaged for wheat	47,788	63,139
Totals	360,443	340,222

To get the carrying capacity, add 65 per cent to the registered tons as given above.

From July 1, 1890, to Sept. 10, 1890, the following are the exports from this port:

	1890.	1889.
Wheat, ctls	2,138,366	2,118,893
Flour, bbls	209,827	232,317
Barley	54,852	268,524

Free receipts of poultry from the Central States are against Californian. The consumption appears to be increasing.

Beans have a weaker tone. Receipts are increasing.

Choice grades of honey are in good request, but the poorer are slow.

Hops are slower. The market is very strong at full prices. Some holders are asking 40c a pound for choice grades.

Wool begins to show signs of increasing strength, but as yet no higher quotations are given.

Overland shipments in last month are as follows: Beans, lbs, 3,467,450; brandy, gals, 24,854; wine gals, 97,686; fruits, lbs, dried, 6,897,890; citrus, 47,600; deciduous, 20,721,660; hops, lbs, 302,700; canned goods, lbs, 12,880,350; mustard seed, lbs, 70,020; onions, lbs, 264,460; hay, lbs, 44,800; potatoes, 8,068,680; wool, lbs, grease, 1,089,440, pulled, 90,810, scoured, 437,510; honey, lbs, 368,780; vegetables, lbs, 114,130.

Exports by sea the past week aggregate as follows: Wheat, ctls, Central America, 1002; Mexico, 452; Cork, 83,566; Hull, 51,970. Flour, bbls, Central America, 3082; Honolulu, 4042. Barley, ctls, Honolulu, 3272. Rolled barley, Honolulu, 500 sacks and 161,283 lbs. Potatoes, sks, Honolulu, 189; Central America, 125; Honolulu, 976. Hay, bls, Honolulu, 1572. Wine, gals, New York, 29,597; Central America, 4083; Mexico, 3051; Panama, 13,551; Panama, 110; Honolulu, 5344. Raisins, bxs, Central America, 68; Mexico, 76; Honolulu, 653. Beans, lbs, Panama, 2450; Victoria, 3090; Honolulu, 17,064. Brandy, gals, Central America, 738. Canned fruits, cs, Victoria, 250; Philadelphia, 411. Dried fruits, lbs, Victoria, 1000; Honolulu, 845. Bran, sks, Honolulu, 1800.

The receipts of eggs at San Francisco during the past eight months were as follows:

Months—	California.	Eastern.	Oregon.
January, doz	162,774	213,720	.....
February	317,761	412,050	12,510

California Fruits East.

NEW YORK, Sept. 12.—E. L. Goodsell sold California fruits at auction yesterday, for account of the Earl Fruit Co., Sacramento, at the following prices: Beurre Hardy pears, $2.70; Susquehanna peaches, $1.90; Orange Cling peaches, $1.90; Yellow Cling peaches, $1.50; Salway peaches, $1.40; Egg plums, $1.75; green gages, $2 25; German prunes, $2.25; Gros prunes, $2.70; single crates Muscat grapes, 90c @$1.15; Tokay, $1.10@2.10. Grapes were all in bad order.

CHICAGO, Sept. 12.—The Earl Fruit Co. to-day sold California fruits at auction as follows: Beurre Hardy pears, $3.05@3.10; Howell pears, $3 50; Bartlett pears, ripe, $3.40; Beurre Clairgeau, $2.15@$2.40; Duchess pears, $2.50; Beurre Diel, $2.60; Louise Bonne pears, $2.60; half-crate Tokay grapes, $1.75; Salway, $1.50; Strawberry peaches, $1.45; White Malaga, 70c@$1.

CHICAGO, Sept. 13.—Porter Bros. sold nine carloads of California fruit to-day as follows: Grapes, hf-crates, Tokay, $2.10@2.75; full crates, Verdelle, $2.50; full crates, Muscat, $2.50; Portugal, $2.50; hf-crates, Muscat, 75c@$1; do, Tokay, $1@$1.40; Cling peaches, $1@1.50; pears, Beurre Clairgeau, $2.75; Duchess, $2.75; Bartlett, $3.10@3.25; Howell, $3.35; Onondaga, $3; Silver prunes, $1.15; German, $1.25.

CHICAGO, Sept. 13.—California green fruits are coming forward quite freely. Pears are rather firm, and plums are steady, being scarce. Peaches and grapes, however, rule easy. Peaches, 20-lb boxes, Crawford, 75c@$1; Orange Cling, 75c@$1.50; pears, Bartlett, ripe, $2@3; Duchess, $2.75@3; Beurre Clairgeau, $2.75@3; Beurre Hardy, $2.75@3.25; Howell, $2.75@3.35; Beurre Bosc, $2.75@3; Gros prunes, $2.25@2.50; Egg plums, $1.50@1.75; German prunes, $1.75@2.25; grapes, hf-crates, four baskets, Muscat, 50c@$1.25; Tokay, 75c@$1.50; Damascus, $1; Morocco, 75c@$1.25; Rose de Peru, 75c@$1.25. There is reported a moderate trade in a small way in the California dried-fruit market. Stocks are light and prices rule high. The latter fact checks the demand and trade is quiet, and not the activity of a year ago. Several cars of raisins are on the way. Quotations range: Apricots, 17½@18c ⅌ lb; peaches, unpeeled, 21@23c; do, peeled, 30@32c; nectarines, Red, 17@18c; do, White, 19@20c; dried grapes, 5½@5¾c. Beans continue to rule dull.

NEW YORK, Sept. 15.—Sgobel & Day, agents of the California Fruit Union, sold two carloads of California fruit as follows: Bartlett pears, $3.50; Tea Grant peaches, $1.70@2.25; Salway peaches, $1.85; Black Hamburg grapes, $2@2.25 per hf-crate; Muscat grapes, 65c@$1.15 per hf-crate; Tokay grapes, $2.30@3.50 per full crate; $1.15@1.50 per hf-crate; Emperor grapes, $1.10; Malvoise grapes, $1.25.

CHICAGO, Sept. 15.—The Porter Bros. Co. sold seven carloads of California fruit to-day, at the following prices: Tokay grapes, $3.25 per full crate; 80c@$1.70 per hf-crate; Black Morocco grapes, $1.95 per hf-crate; Muscat grapes, 60c@$1.25 per hf-crate; $2 20@2.25 per full crate; Blue Malvoise grapes, $1.20@1.45 per hf-crate; Black Hamburg grapes, $1.40 per hf-crate; Salway peaches, $1.50@1.40; Duchess pears, $2.70; Beurre Diel pears, $2.45; White Doyenne pears, $2.45; Beurre Gris pears, $2.40; Howell pears, over-ripe, $2.80; Bartlett pears, over-ripe, $3.10.

The Earl Fruit Co. sold California fruit as follows: Bartlett pears, $3; Beurre Clairgeau pears, ripe, $2.20@2.35; Tokay grapes, $2.20@2.35 per full crate; Edible, $3 40; Strawberry and Orange Cling peaches, $1.70; Susquehanna peaches, $1.60; McKevitt peaches, $1.70; Salway peaches, $1.40.

CHICAGO, Sept. 16.—The Earl Fruit Co. sold to-day: Winter Nelis pears, $2.25@2.35; Keifers, $2.55; Salway peaches, $1.40; Susquehannas, $1.45 @1.50; Orange Clings, Heath and Rose Clings, $1.45. Grapes—In fair condition, Tokays, full crates, $2@2.60; Muscats, full crates, $1.90@2.20. Weather fine and cool.

Porter Bros. sold to-day ten cars California fruit. Full crates Muscat grapes, $1.80@2.50; full crates Tokay grapes, $1.70@3.30; half crates, Tokays, 85c @$1.45; Nectarines, $1.90@2; White Cling, $1.45; Bartlett pears, $3.5c@4.95; Beurre Hardy, $3.50@ 3.55; Beurre Clairgeau, $2.25@2.90; Golden Drop plums, $1.25; Fellenburg plums, $1.15@1.40; Beurre Bosc pears, $3.85@3.95; Howell pears, $3.50@3.85; Japan plums, $3.20; Orange Cling peaches, $1.10@ 1.80; Silver prunes, $1.30@1.35.

CHICAGO, Sept. 17.—In the California green fruit market peaches are steady and pears firmer, with fair demand. Plums are scarce and steady, but grapes continue to rule easy. Peaches—Crawfords, 20-lb boxes, $1.50@1.75; Orange Clings, $1.50@ 1.75; Bartlett pears, green, $4@4 50; ripe, $2@3; Duchess, $3.25@3.50; Beurre Clairgeau, $2 75@3; Beurre Hardy, $3@3.50; Howell, $2.75@3.25; Beurre Bosc, $2.75@3.25; Gros prunes, 20-lb boxes, $2.50@2.75; Egg plums, 20-lb boxes, $1.25@1.50; German prunes, 20-lb boxes, $1.75@2; Grapes, half cases, four baskets—Muscats, 75c@$1; Tokay, $1; Damascus, $1; Black Morocco, $1@1.50; Rose Peru, 75c@$1.25. Inquiry in the California dried fruit market is restricted and the supply is very moderate. The market is ruling very quiet; Apricots, ⅌ lb, 16½@17c; peaches, unpeeled, 18½@20c; peeled, 30@32c; Nectarines, red, 17@18½c; white, 19@20c; dried grapes, 5½@5¾c; prunes, 50 to the lb, 12@12½c; 70 to the lb, 11½@11¾d; 80 to the pound, 10½@11c.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR WEEK ENDING SEPT. 9, 1890.

436,204.—SNOW PLOW—L. J. Bergendahl, Port Townsend, Wash.

436,170.—WATER-WAY AND GATE FOR RESERVOIRS—T. B. Craycroft, Panoche, Cal.

436,228.—STEAM COOKER—Jane E. Ford, Ross Station, Wash.

435,966.—SASH HOLDER—F. Frank, Suisun, Cal.

436,230.—SAFETY GAS-BURNER—Frechette & Dupuis, Carson, Nev.

435,926.—GAFF JOINT FOR VESSELS—P. E. Frostad, La Conner, Wash.

435,927.—PIPE COUPLING, ETC.—J. Ginty, San Diego, Cal.

436,180.—FENCE MACHINE—T. P. Madill, Albany, Ogn.

436,293.—WINDMILL—R. B. Sinclair, Alameda, Cal.

435,983.—ELECTRICAL TRACTION APPARATUS—Wm. Stephens, Santa Rosa, Cal.

436,027.—ORE STAMP—C. W. Tremain, Portland, Ogn.

435,986.—DIE FOR MAKING LATHING—Geo. H. Tucker, S. F.

436,278.—REFRIGERATOR—Vecchio & Mignola, S. F.

The following brief list by telegraph for Sept. 16 will appear more complete on receipt of mail advices:

California—George S. Andres, S. F., apparaus for making extracts; James T. Fish, S. F., fruit-pitting machine; Smith McGaryin, San Jose, running gear; Frank McClure, Stockton, chuck for turning lathes; Dr. F Oliver, S. F., hay rickers; Henry A. Peabody, Ukiah, fence post; Charles B. Towle, Vallejo, school desk; Frank White and F. J. Murphy, Pomona, animal trap.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

An Invitation to Grangers.

Grangers who visit Watsonville are invited to call and see the Percherons of L. V. Willits at Watsonville. See advertisement.

BUGGIES, Buckboards, Spring Wagons, Surreys and Road Carts. Write for our new catalogue. Baker & Hamilton, San Francisco and Sacramento.

Different Sections of Country Demand Different Styles of Implements.

P. P. Mast & Co., recognizing that there is a growing demand for a Spring Tooth Seeder and Cultivator, made especially to suit the different soils and broad-gauge style of farming in this country, have constructed a Seeder specially adapted for that purpose, ranging in width from 6¾ to 14 feet.

The luxuriant growth of weeds and trash that cannot always be fully turned under with the Plow, makes it difficult to operate the Drill and the Seeder and Cultivator as usually made. In the construction of this seeder they have had special reference to the condition of the land, as will be seen by reference to cut on page 264. The cultivator teeth are arranged in gangs, so as to pass the trash between the gangs and still cultivate every inch of the soil. The yielding of the teeth while in operation serves to aid in freeing the teeth from the stubble and weeds. The gangs are attached in sections to the lifting bars, so they are easily raised out of the ground, and by reversing the levers sufficient pressure can be obtained to cultivate the hardest kind of unplowed ground when being prepared for volunteer crop. The seed-distributing mechanism is the same we have used on the celebrated Buckeye Drill, and to persons wanting to use a BROADCAST Seeder and Cultivator we can confidently recommend this machine. It is strong, durable, and will do the work efficiently. We are safe in saying that the House of P. P. Mast & Co. carries in stock the largest line of Drills and Seeders on the Pacific Coast.

FEARLESS.

This Threshing machine received the two last **Gold Medals** given by the New York State Agricultural Society; and has been selected, over all others, and illustrated and described in that great work, "Appleton's Cyclopedia of Applied Mechanics;" thus, establishing it as the **standard** machine of America. **Straw-preserving Rye-Threshers, Clover-hullers, Ensilage-cutters, Feed-mills, Fanning-mills, and Wood Saw-machines;** all of the **best** in market. The **Fearless Horse-powers** are the most **economical** and **best** Powers built for the running of Ensilage cutters, Cotton gins, and general farm and plantation use. West American Oaks.

Some time ago James McDonald of this city generously furnished the means for the publication of the life work of the late Dr. Kellogg in relation to West American oaks. Recently a second part of the work has been published, and in a prefatory prepared by Prof. George Davidson, who was a life-long friend of the late doctor and took a good deal of interest in having placed before the public the work of his friend, the professor says: "Upon the publication of the first part of this work, the 'West American Oaks,' Mr. McDonald was impressed with the necessity of further examination and study of the new species and varieties mentioned therein. These had not been known to Dr. Kellogg; the systematic plan of collection, investigation and representation, which was his life work, being broken by declining health and adverse circumstances.

"After a few copies of the work had been sent out, the further distribution was suspended until the new species should be illustrated, and Mr. McDonald suggested that special examination should be made to secure satisfactory specimens. When the matter had been fully discussed, Prof. Greene volunteered to give his vacation for the summer to field work in the Sierra Nevada and in the Rocky mountains of Colorado and Montana. Mr. McDonald generously bore all the expenses of the trip, and the result has been the verification of former species and the acquisition of new ones. Prof. Greene has since employed his hours outside of University duties in the description of all these species, and in the direction of the drawing by Mr. George Hansen."

This addition by Prof. Greene makes the history and bibliography of the work complete, and makes it one of the most interesting additions to works heretofore published in relation to forest trees. The engravings are of the finest, and are beautiful representations of the several varieties of the oak thought worthy of illustration.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none out worthy men.

THE PELTON WATER MOTOR

Affords the cheapest and most convenient power for Ranch, Vineyard or Dairy purposes, as well as for running dynamos for electric lights, pumps and every other variety of machinery.

It possesses in the same degree the wonderful energy and power that has made the Pelton Wheel famous in all parts of the world.

These motors are made of varying sizes, with capacities ranging from the fraction of one up to 15 and 20 H. P., enclosed in iron cases, all ready for pipe connections, and are warranted to develop a given amount of power with one-half the water required by any other wheel.

The cost, considering capacity and efficiency, is fully 50 per cent less.

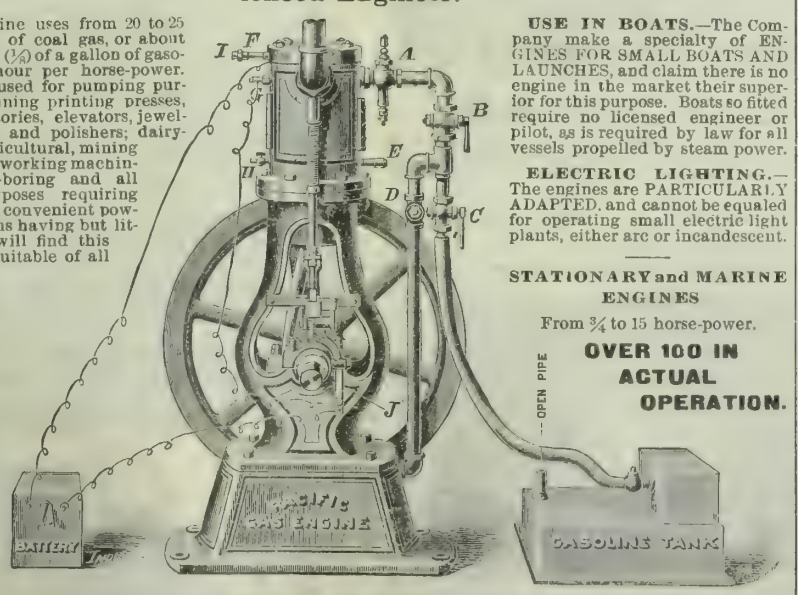
Circular, giving full information, sent on application.

Parties writing for information should give full particulars as to power wanted, source of water, supply, with head or pressure. Address

THE PELTON WATER WHEEL CO.,

121 Main Street, San Francisco, Cal.

THE



PACIFIC GAS OR GASOLINE ENGINE.

PATENTED JUNE 17, 1890—NOS. 430,504, 430,505, 430,506.

Also in Great Britain and other foreign countries.

Starts Instantly Without the Necessity of Boiler, Fire or Experienced Engineer.

The engine uses from 20 to 25 cubic feet of coal gas, or about one-eighth (⅛) of a gallon of gasoline per hour per horse-power. It can be used for pumping purposes, running printing presses, small factories, elevators, jewelers' lathes and polishers; dairymen's, agricultural, mining and wood-working machinery; well-boring and all other purposes requiring cheap and convenient power. Persons having but little space will find this the most suitable of all motors.

USE IN BOATS.—The Company make a specialty of ENGINES FOR SMALL BOATS AND LAUNCHES, and claim there is no engine in the market their superior for this purpose. Boats so fitted require no licensed engineer or pilot, as is required by law for all vessels propelled by steam power.

ELECTRIC LIGHTING.—The engines are PARTICULARLY ADAPTED, and cannot be equaled for operating small electric light plants, either arc or incandescent.

STATIONARY and MARINE ENGINES

From ¾ to 15 horse-power.

OVER 100 IN ACTUAL OPERATION.

READ THESE TESTIMONIALS.

ALAMEDA, April 8, 1890.

PACIFIC GAS ENGINE CO., GENTLEMEN: Permit me to add my testimonial to the many you have received indorsing your engine. As you are aware, mine was a Regan engine which gave me considerable trouble. I had to remove the head and raise the tappet valve every time I wanted to start the engine. I sent you the engine; you removed all the Regan appliance except the cylinder and stand. You put in your appliance, head, sparking device, inlet valve, and, in fact, changed it to the Pacific Gas Engine, which now works splendidly. I have not had to remove the head for any cause since you made the change (over two months). It gives me no trouble; my boy, 14 years old, attends to it.

The change from the Regan to the Pacific is a decided improvement. I can also get a third more power since the change, and I cheerfully recommend your engine as being simple, effective, and cheap. Respectful y yours,

B. S. HILL, S. W. Cor. Encinal Ave. and Morton St.

MAYFIELD, March 26, 1890.

PACIFIC GAS ENGINE CO.—We have given your little 1-H. P. engine a splendid advertisement. A fire broke out at 2:30 o'clock this morning, in a tenement house on my premises. I started the engine, connected the hose, and by its use saved at least $3000 worth of my property. I saved my blacksmith shop, lying 12 feet from the burning building, my barn and my dwelling. Three times the fire started in these buildings, and I extinguished it every time. The engine never faltered, and threw water between 50 and 60 feet high. The whole town was astonished, and they acknowledged that I saved at least $20,000 worth of property.

A fire department is being organized here, and I think they will have one of the engines on a truck for fire purposes *They cannot be beaten.*

Hoping that all of your customers will be as well pleased with the engine as I am, I remain, Yours truly,

JOS. P. PONCE.

The Whole Country Needs Fertilization

ADMONITION TO FARMERS!

GUAYMAS, MEXICO, September 9, 1890.

R. E. CUNNINGHAM, ESQ., Agent Mexican Phosphate and Sulphur Company—DEAR SIR: In answer to your request as to the value of phosphates for worn out lands, I will state that it is my opinion the lands of the older settled portions of California afford a good field for the use of phosphates. These lands have been cropped for years without any restoration of the chemical constituents necessary for an abundant crop. They therefore show plainly that they need assistance artificially to produce crops good in quantity and quality, let the crop be whatever it may.

Take, for instance, San Joaquin and Santa Clara valleys, and what do you see? [illegible] crops that are so imperfect in quantity and quality that the eye at once detects the defect. The [illegible] resorted to must be infused into the soil to replace the chemical properties that have been [illegible] previous crops, and the writer is of the opinion that a liberal supply of phosphates will accomplish this.

Cal State Library JI '90

The attention of the cultivators of the soil is sharply turned to rotation of crops, hoping thereby to get wealth out of their lands without fertilization. Some have turned their attention to beet cultivation in soil worn out by other crops. Beet or other seeds will not grow successfully unless the soil will nourish them.

This summer I saw several crops of beets on excessively cropped lands, the majority of which showed that there was something wanting to complete the plants to ample size and in quantity that should be expected of sugar beets under favorable circumstances. If a good crop is not obtained, there is deficiency in profit. It costs as much to cultivate soil deficient in chemical properties as it does if ample nutrition was in the soil. Under the former condition a deficient crop is certain, while under the latter condition he may reasonably expect an ample crop with profit.

Fields often are allowed to go to weeds, supposing thereby to enrich the soil. This is an uncertain method and not profitable. Your weeds have grown up and seeded; the dead stems can only add a limited addition to fertilize the soil, while the seeds of the same will cause much expense to exterminate them from the future crops. Besides, while thus only weeds as a crop, no profit was realized, while if a supply of phosphates had been applied to the soil, a profitable crop of beets or corn would be had. Besides, the weeds would have been exterminated during the cultivation of the said crop. I am, Sir, your obedient servant,

EDWARD PALMER, M. D.

Autumn Scenes and Songs.

The summer's throbbing chant is done
And mute the choral antiphon;
The birds have left the shivering pines
To flit among the trellised vines,
Or fan the air with scented plumes
Amid the love-sick orange-blooms,
And thou art here alone—alone—
Sing, little bird! the rest have flown.
—*Holmes.*

I love to wander through the woodlands hoary
In the soft light of an autumnal day,
When Summer gathers up her robes of glory
And like a dream of beauty glides away.
—*Whitman.*

The sweet, calm sunshine of October, now
Warms the low spot; upon its grassy mould
The purple oak leaf falls; the birchen bough
Drops its bright spoil like arrow-heads of gold.
—*Bryant.*

Now Autumn's fire burns slowly along the woods,
And day by day the dead leaves fall and melt,
And night by night the monitory blast
Wails in the keyhole, telling how it pass'd
O'er empty fields or upland solitudes,
Or grim wide wave; and now the power is felt
Of melancholy, tenderer in its moods
Than any joy indulgent Summer dealt.
—*Allingham.*

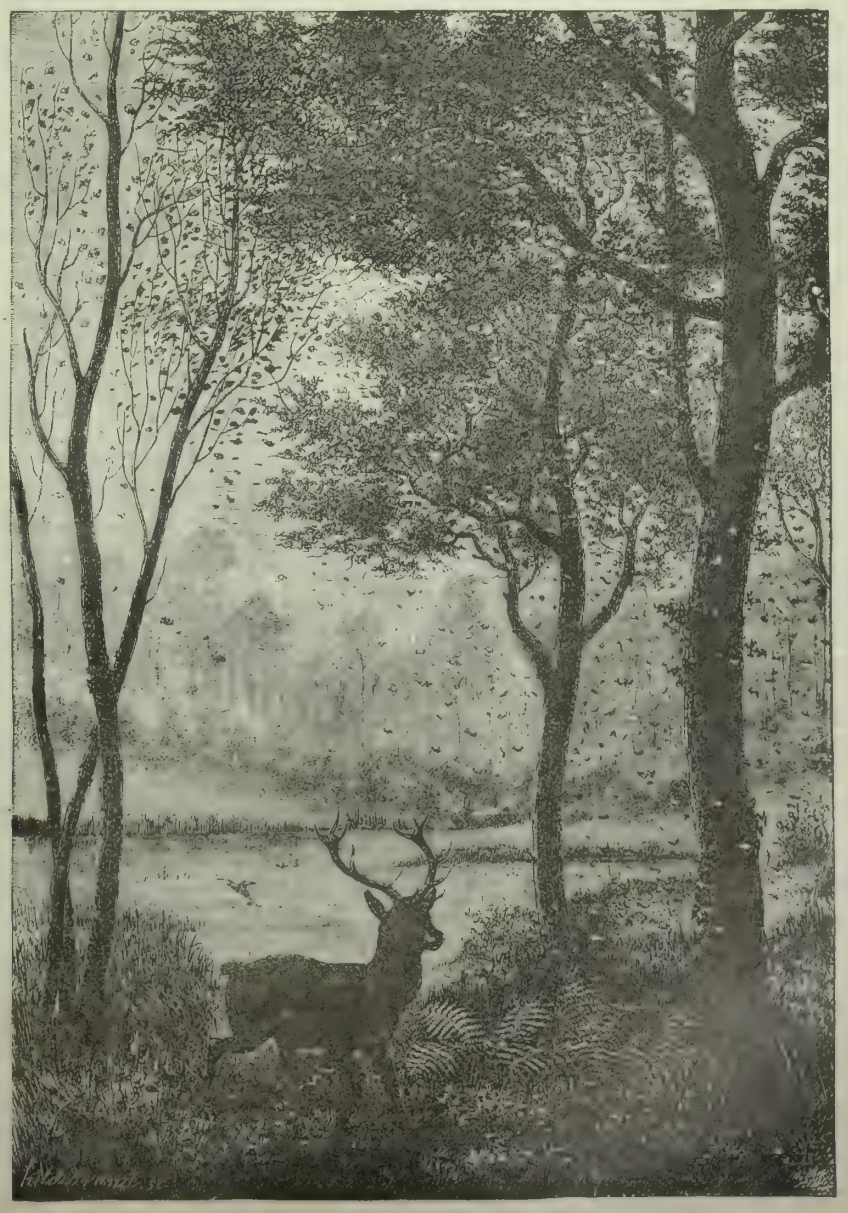
There is a beautiful spirit breathing now
Its mellow richness on the clustered trees;
And, from a beaker full of richest dyes,
Pouring new glory on the autumn woods,
And dripping in warm light the pillared clouds.
—*Longfellow.*

Crown'd with the sickle and the wheaten sheaf,
While Autumn nodding o'er the yellow plain, comes jovial on.
—*Thomson.*

There is a fearful spirit busy now;
Already have the elements unfurled
Their banners; the great sea-wave is up-curled,
The cloud comes; the fierce winds begin to blow
About, and blindly on their errands go,
And quickly will the pale red leaves be hurled
From their dry boughs, and all the forest world,
Stripped of its pride, be like a desert show.
—*Cornwall.*

What visionary tints the year puts on,
When falling leaves falter through motionless air,
Or numbly cling and shiver to be gone!
How shimmer the low flats and pastures bare,
As with her nectar Hebe Autumn fills
The bowl between me and those distant hills,
And smiles and shakes abroad her misty, tremulous hair!
—*Lowell.*

Thy mellow autumn came, and with it came
The promised party to enjoy its sweets.
The corn is cut, the manor full of game;
The pointer ranges and the sportsman beats
In russet jacket; lynx-like is his aim;
Full grows his bag and wonderful his feats.
Ah, nut-brown partridges! ah, brilliant pheasants!
And ah, ye poachers!—'Tis no sport for peasants.
—*Byron.*



It is the season where the light of dreams
Around the year in golden glory lies;
The heavens are full of floating mysteries,
And down the lake the veiled splendor beams!
Like hidden poets lie the hazy streams,
Mantled with mystery of their own romance,
While scarce a breath disturbs their drowsy trance.
—*Reade.*

All-cheering plenty with her flowing horn,
Led yellow Autumn, wreathed with nodding corn.
—*Burns.*

It was autumn, and incessant
Piped the quail from shocks and sheaves,
And like living coals, the apples
Burned among the withering leaves.
—*Longfellow.*

Every season hath its pleasures,
Spring may boast her flowery prime;
Yet the vineyard's ruby treasures
Brighten Autumn's sober time.
—*Moore.*

Sorrow and the scarlet leaf,
Sad thoughts and sunny weather;
Ah me! this glory and this grief
Agree not well together.
—*Parsons.*

CORRESPONDENCE

Correspondents are alone responsible for their opinions.

From Humboldt County.

[illegible].

EDITORS PRESS.—I verily believe that Humboldt county has the most varied resources of any county of like area in this State. It has unexcelled dairy and cattle ranches. Its sheep ranges yield excellent mutton, and the wool commands the highest market price of any wools grown in California. It can produce plenty of fruit of quality equal to the product of any country. Apples, pears, prunes, plums, peaches, nectarines, apricots, cherries, grapes, figs, almonds, etc., grow and yield abundantly. It has farms which produce astonishing crops of alfalfa and excellent grain. Corn does well, and I could relate facts in regard to potato crops which would gain for me the reputation of being the "boss prevaricator." Vegetables of all kinds grow finely and anything grows and yields without irrigation.

Humboldt county has an extensive area of redwood timber lands, and a larger area of fir, madrone, laurel and tanbark. It has gold mines and undeveloped coal and copper mines. It produces petroleum in an insufficient quantity, yet capable of development by intelligent prospecting, and a low grade of silver ore.

Do not believe that this variety and excellence occurs on every 40-acre lot. The climate and soil of the county are as varied as its productions and resources. The coast section, south of Humboldt bay, is devoted mainly to dairying and cattle-raising, while north of the bay the chief interest is lumbering, and in the interior wool-growing is the leading industry. The whole is interspersed with a variety of farming, fruit-growing, etc, in keeping with the nature of the soil, climate, and inclination of the country. The tendency of a large portion of the county to incline occasions a series of multiform landscapes fully in keeping with its variety of healthy and invigorating climate. Near the coast it is not unusual to wear an overcoat on the Fourth of July, while a neighbor a few miles farther east celebrates Independence Day where the thermometer is 100° in the shade. During the Christmas festivities the "coaster" wears the same overcoat while his neighbor shivers before a blazing fire and remarks: "I think it is going to snow," and should he chance to be a resident on one of the higher ranges it is not unlikely that his prediction will be fulfilled to the extent of three or four feet in depth; yet little snow falls upon the larger area of the county, but it rains and rains, until one is weary of being soaked, and crops never fail from lack of moisture, and everywhere one encounters springs, brooks, creeks and rivers of clear, cold, excellent and wholesome water. An abundance of fuel and water, crops never fail from drouth, no cyclones, tornadoes nor blizzards, no malarial fevers, chills nor ague, surely this county is bountifully blessed.

So much for the topography of the county generally, which we conclude by saying that railroad communication with the interior of the State, north, south and east, is the only element lacking to bring Humboldt to the front as one of the most populous and leading counties of the State.

We will review all sections of the county in detail, beginning at Shelter Cove, which is the most southern shipping point and the most convenient outlet for the large quantities of wool and tanbark produced in the southwestern portion of the county.

Shelter Cove

Is an open port, having a fine wharf which extends from the shore outward to a convenient and safe place of anchorage for vessels, and is well sheltered from "nor'westers," which sometimes prevail off the coast; and it is not unusual for northbound vessels to put in here and anchor until the weather becomes calm. During the shipping season, from April to November, the steamer Newport makes regular weekly trips to San Francisco and returns laden with supplies for the merchants, stockmen and woodsmen of Briceland, Garberville, Harris and the intervening country. From December to March, southerly storms prevail and the cove does not afford a safe anchorage for vessels, consequently shipping is abandoned until more favorable weather.

Mr. John Ray is the sole owner and proprietor of the Shelter Cove wharf and warehouse, and connected therewith is the Shelter Cove ranch—a very desirable property, especially adapted to dairying and stock-raising. Although the prevailing fogs do not admit of satisfactory fruit and grain growing, small fruits yield abundantly and calla lilies bloom in the open air all the year round. The scenery is grand and picturesque. The ranch consists of a succession of terraces which terminate in a range of mountains several hundred feet above the seashore, while to the north and south the Pacific beats against precipitous and inaccessible cliffs, surmounted by mountains of evergreen woodland and lofty peaks.

Leaving Shelter Cove by wagon-road, we wend our winding and weary way five miles to the summit of the first range of mountains and reach the coast-route wagon-road, which is a thoroughfare between the coast sections of Humboldt and Mendocino counties. Here we pause for a fine view of the ocean, should it not be foggy, and ask ourselves why it should be quite cool at the cove and very warm at the top of this range overlooking the ocean. Then away we go—down, down, this way and that way, around here and around there, and a few minutes bring us to Frank McKee's in a cosy little vale, shut in on all sides by wooded peaks, and containing groves of laurel from the burls of which Mr. McKee has succeeded in producing incomparable specimens of furniture.

Laurel Burls.

I have never seen anything equal it. It is both rare and beautiful and cannot easily be duplicated. He has also invented a knife which turns out very artistic lumber for wainscoting and finishing purposes. The knife should be patented and introduced throughout the country, as it is now used only in Mr. McKee's mill, which is a small concern for his own use mostly.

Here is another junction of roads: The coast road to Mendocino and another known as the Garberville and Shelter Cove road connects the coast road with the interior, and taps the wool-growing section of country connecting with the South Fork and overland wagon-roads, and connecting the South Fork road with the White Thorn valley road which forms the coast-route mail and stage line, which is beyond a doubt a desirable route for travelers, as it embraces the redwood belt of both Mendocino and Humboldt counties, and connects all places in either or both counties. T. B. L.

Notes from the Antipodes.

EDITORS PRESS:—From the report of the superintendent of the Botanic Gardens of Adelaide, South Australia, for the past year (1889) we learn that the rainfall for that year was the most copious on record, footing up 30 872 inches. This unusual occurrence was accompanied by other marked abnormal atmospheric conditions. The large amount of rain was, however, very favorable to the agricultural interests of the region, which had previously passed through several dry seasons.

Several new plants have been introduced and are being experimented with, among them a new vine from Mexico; the Chinese Artichoke (*Stachys tubirifera*); the Sisal Hemp (*Agave Sisalana*) for fiber; and the *Lathyrus sylvestris* for fodder.

The Lathyrus is said to yield as much as four tons of hay per acre, and this in the poorest soil.

It is found growing wild in some parts of Europe, and the nutritious value of the hay made from it is about twice that of clover hay.

It is so highly prized in Prussia that the Government has issued an order granting a subsidy of about $2.50 per acre to landholders who will cultivate it upon their waste land.

The California coniferous trees, which in their native habitat are found at an altitude of from 500 to 1000 feet, flourish on the plains of South Australia, as do many succulent plants, such as Agaves, Yuccas, Aloes; and species of several genera of cactaceous plants.

In the matter of fruit trees, it is remarked that all the stone fruits attain a large size and are of excellent flavor, but the trees are short lived, in consequence of their quick and luxuriant growth and early and excessive production of fruit. L. G. YATES, F. L. S.

Santa Barbara.

Marginal Notes.

EDITORS PRESS:—On page 226 of the RURAL PRESS of Sept. 13th are two articles on which comment is needed. Concerning the article "Is It Chance?" I have to say that the growing top of a morning glory vine swings around toward the east on the south side of the object which it climbs; a hop-vine twines the other way. A cyclone in the northern hemisphere moves eastward on the south side of its center; south of the equator the motion is the reverse. Possibly trees of the same kind are prone to twist alike, but there are both right and left contortions among the sticks in my wood-pile.

Another article is headed "Wonderful Trees." The traveler who could say of our grandly beautiful sequoias, "They are not beautiful—simply enormous," should consult an oculist. The same language concerning a lily would express the whole artistic appreciation of a mite groveling at its base.

The quivering tree of Georgia, the moving palm of India and the iron plant of Africa may safely be placed in the genus *hoax* along with the snow-flower of Russia, which blooms only on New Year's Day, and the carnivorous tree of Mexico whose tentacular branches clutch birds and suck their blood. The marvels of fiction are not needed to augment the admirable wonders of the vegetable kingdom.

San Jose. VOLNEY RATTAN.

Merced County.

EDITORS PRESS:—About one year ago you published a communication from my pen concerning this locality. Another year's crops have demonstrated the statement I then made that this part of Merced county is especially adapted to the production of peaches, pears and other orchard fruits. Two hundred dollars net per acre have been obtained from young peach orchards here this season. Pears paid nearly as well. A large area was planted to Malaga grapes last spring, but unfortunately cuttings were used instead of rooted vines, and much of the setting will have to be done over. It is hard for some people to see that haste makes waste.

Several carloads of green fruit have been bought of the Buhach Co. here, and shipped to Texas. Our dried fruit is sold in your city.

It seems to me that this is one of the most favorable localities for men of small means to engage in fruit-raising. Good fruit land can be had for $100 per acre, with water right and one dollar per acre annual water rent. We have an abundance of water flowing in our ditches now (Sept. 15th) and will have until it rains. Our sandy soil requires irrigating less frequently than the hard lands. There are vineyards which are never irrigated, that yield good crops. We have the S. P. R. R. through our neighborhood, and the Oakdale extension a few miles east of us where the new Rotterdam is being established. W. T. KIRKMAN.

Atwater.

HORTICULTURE.

Cutting Back Pruning.

EDITORS PRESS:—I have just been reading with much pleasure J. M. Edmiston's article in the RURAL of Sept. 6th, which, by the way, I consider one of the finest issues of your usually fine issues that I have seen, on "Summer Pruning of Deciduous Fruit Trees," wherein he propounds the question, "What, then, is the theory of summer pruning?" and his answers are so rational and agree so nearly with the practice I have so persistently recommended and practiced, that I cannot forbear reiterating that not only the theory but the practice of pruning at any and all seasons of the year should be "to make the branches short and stubby so they can bear a heavy load without breaking down, and to increase the number of fruit-bearing branches and develop the fruit-buds near the trunk of the tree, etc." I am pleased to notice this mode of pruning is being so generally advocated, and it is to be hoped will be universally practiced, for, unquestionably, it is a correct one.

The plan usually practiced of commencing at the lower extremity of the trunk and trimming up, leaving the trunk exposed to the scalding rays of the sun, sending the sap skyward to develop fruit-buds and nourish fruit-growing at the extremity of long, slender branches, should be put a stop to at once, and a new departure be taken, by commencing at the top and pruning downward. Even this should be done when small trees are being set out. Cut off the top of a long, slender tree and a stout, stocky body will grow, needing no staking to keep it in position. J. S. TIBBITS.

Muskegon, Mich.

A Eucalyptus Fruit-Ladder.

EDITORS PRESS:—I saw a description of a fruit-ladder in the RURAL PRESS for Sept. 6th, which seemed to be just the thing to fill a long-felt want, and I cut a eucalyptus pole (every one should have abundance of these growing on his farm for many different purposes besides firewood) three inches through at the butt and 1½ inches at the top when the bark was taken off, 13 feet long; partly sawed and partly split it to within two feet of the top, where I wound around a bale-rope to prevent further splitting, spread the bottom 3½ feet, sawed notches half an inch deep into which I nailed strips of boards for steps, as the pole was too small to bore with an auger, and I had the neatest, lightest, handiest fruit-ladder that ever was! I had several other ladders, including a step-ladder, but this, after I saw the point, was a necessity. It is almost a pleasure now to pick fruit. It is rather small for some of my tallest apple trees; with this exception, it seems about as near perfect as they usually make things in this lower world. The wonder is that such a ladder has not been in use long ago. Moral: Read the PACIFIC RURAL PRESS S. P. SNOW.

Santa Barbara

The French Prune in Ventura.

EDITORS PRESS:—It is a peculiar fact that the culture of the French prune has been heralded by the newspapers of various counties in the State for its adaptability to the soil for their respective localities, and a stranger might infer that it could not be successfully grown in other places. But such is not the case, however. It can be proven that Ventura county is not in arrears by any means. It is grown three miles from the coast, and in the interior valleys it is likewise productive. It is interesting to note the yield of some of the orchards in other counties, and I have yet to learn of any statement being published from Ventura county. I wish to add an appendage to show we can raise prunes here. I have less than 1500 prune trees, six and eight years set, with walnuts placed between, and every alternate tree in the walnut row is a prune. I harvested over 104 tons this season. On less than two acres I have 240 prune trees six years set, put out described as above. From them I harvested 25 tons, 480 pounds, and I sold them for $40 per ton. It is a simple matter to make a calculation of the yield in dollars per acre, and it demonstrates the fact that the production and prices compare well with other localities.

Ventura. N. B. SMITH.

[The French prune is perhaps our best all-around fruit variety. Though, of course, it has preferences, we doubt if any one variety succeeds in so many different localities.—EDS. PRESS.]

A Prune Yield in Tulare.

The following statement is sworn to by several witnesses: My name is C. W. Clarke. I reside in the city of Sacramento, California, and have resided there for the 40 years last past; that on the 1st day of September, 1890, in company with several other gentlemen, I went to the Briggs orchard, situated on Section 9, Township 19 south, Range 25 east, M. D. B. and M., about four miles southeast from Visalia, Tulare county, California; that while there we had gathered the product of one tree of the French prune variety, which said tree is six years old; that from said tree I saw gathered, cleaned and weighed one thousand one hundred and two (1102) pounds of prunes, and I am confident that many other trees in same orchard, of same variety and age, will produce as many, if not more, pounds of prunes than the one whose product I saw gathered and weighed.

Copperas and Pruning.

EDITORS PRESS:—I have read with much interest and profit F. S. C.'s communication in your issue of Aug. 26th. Mr. Bassford's decision on the "Iron" question was something new to me, and feeling assured that he was speaking from personal experience, I would like to know how much copperas he intended would be sufficient for bearing trees of say from six to seven years old.

I also notice that he does not approve of cutting back the long shoots of bearing prune trees. If they are not cut back somewhat, will not there be too much fruit on the extremities of the trees? My prune trees are well topped, and have been bearing for three years. Shall I allow the long, young growth to remain or not? J. M. C. MOORE.

Otay, San Diego Co.

THE VINEYARD

Raisin-Growing in San Diego.

One of the most interesting subjects discussed at the San Diego Horticultural Convention last week was raisin-culture. The subject was brought up in an essay by A. W. Hawley of El Cajon, which was followed by a general talk. The article, as published in the National City *Record*, is given below:

The varieties of grapes used in making raisins are but two—the Muscat of Alexandria and Muscatel Gordo Blanco. Some contend that there is but little or no difference between the two. Gustav Eisen says: "Both varieties are found promiscuous in most raisin vineyards." Most vineyardists in California favor the Gordo Blanco, claiming that it is a better and surer bearer, giving both larger clusters and larger berries.

In regard to planting, I should make but little difference between cuttings and rooted vines. The roots are preferable for a dry year. The first year the rooted vines show a greater growth, but after that there seems to be no perceptible difference. If irrigation is used I would recommend planting from 8 to 10 feet apart; if not, from 10 to 12. The soil should be plowed deep and be thoroughly pulverized before planting. The system of plowing in winter has become almost universal as the mode of cultivation. By plowing both ways, nearly all the ground is stirred to a good depth, and tends to prevent the formation of a hard crust just below the depth to which the cultivator teeth penetrate, and prevents the formation of evaporator tubes, by which the soil is deprived of its moisture. The cultivator should then be used to destroy all weeds and break the crust after each rain.

The most particular part in raisin culture is to get the vine filled to its capacity with large clusters, for upon this depends the final returns for our labor at the end of the year. There are vineyards in the Cajon that are not filled to half the capacity of the vines, and others that are overloaded. There is seldom a good crop set on vines in a shallow soil, but the trouble comes on our rich, moist land or irrigated vines from the disease termed coulure. Wickson in his "California Fruits" says: "A frequent misfortune of the vine, and for which no remedy is yet known, is coulure, a term signifying the failure of the fruit to set or remain on the cluster." It is pretty generally acknowledged to be caused by mildew, and sulphur is the accepted remedy, yet this fails on vines closely pruned, on moist land. I think we have a certain remedy for this in a system of winter pruning, summer pruning and suckering. I have never had a failure in getting a vine well filled with large clusters of first-crop grapes

where the Chaintre system of pruning is pursued, while with the old system the larger portion will be second crop, which are not so valuable to the producer. This method distributes the grapes along the row and not in a cluster about the head, leaving them so the sun and air, which seem to be death to mildew, can get at them. I would recommend this only on such ground as that of which I speak, on shallow soil. I would advocate the spur system of pruning, by leaving five or more arms or branches, three to six buds long. To develop these buds it will require strict attention to remove all suckers as they appear. On next year's pruning, instead of cutting off any of the old wood, you trim the new wood to one bud beside the base bud. This will throw the majority of the bearing canes away from the center, and by removing suckers whenever they appear, will let in the light and air and prevent coulure. Summer pruning or shortening in the growing canes, if done just as the grapes are going out of bloom, has a tendency to prevent coulure. It causes laterals to start which furnish the much-needed shade later, to prevent the grapes from sunburning and from premature ripening. It also, by checking the vine, develops the fruit. Grapes should not be picked before the expressed juice tests 24 degrees by the saccharometer, after which they should be picked as soon as possible, to get them cured before the rains. An unripe grape will not dry as quickly or weigh as much when dry as a ripe one; so too much haste may make waste. The picked grapes should be placed one thickness on trays. After they are about two-thirds dry they are turned. This is done by two men, one at each end of the tray. They place an empty tray on top of the full one and clasping both ends firmly, invert them, using the emptied tray for the next one, and so continue. When most of the grapes are dry they have to be sorted, taking out what will make layers from those that make loose. In regard to the shelling, grading and packing of raisins, that has almost passed out of the producer's hands into that of the packer's, the producer having to deliver them sorted in sweat-boxes to the packing-house.

At the close of Mr. Hawley's article quite a discussion ensued. The principal point in this was the advisability of summer pruning, on which several members spoke, including Frank Kimball, G. C. Swan and Mr. Edmiston. The latter was in favor of summer pruning just as soon as the blossoms begin to open. His theory was that the pruning prevented a rapid evaporation and thus for a time raised the temperature of the vines. This caused the vine to set greater quantities of fruit. Subsequent pruning was considered injurious, and was only resorted to to stop the dropping of the fruit.

A lady inquired about the best time for winter pruning, and Mr. Hawley answered that any time after the leaves had fallen, about December 1st.

The Chaintre, or as Americans call it the Chaine system of pruning, which leaves branches three or four feet long, was also discussed and was favored by J. M. Asher. Mr. Asher's talk drifted to the growing of Zante currants, which he believed were even more profitable than raisins.

Mr. Edmiston was opposed to the Chaine culture system, and favored the spur system, and would leave from 10 to 25 spurs on each vine, the number of the spurs depending upon the vigor of the vine.

Isaac Martin was also opposed to Chaine pruning, and favored spurs on arms.

Mr. Griffin from Chula Vista expressed the opinion that any system that would produce an unusually large amount of grapes one season would be usually followed later by a decreased crop. He appeared to think both grapes and other fruits would find an average.

Mr. Kimball spoke of Thompson's seedling, which is a seedless raisin grape, of a quality which Mr. Kimball recommended.

Production of Brandy.

The Viticultural Commissioners have received from John W. Mason, Commissioner of Internal Revenue, a statement of the production of fruit brandies in California, as shown by the official statistics since 1864. These figures were obtained by Secretary Scott and are the first that have ever been published in California. The figures show the production for the fiscal year ending June 30th:

Year.	Gallons	Year.	Gallons	Year.	Gallons.
1865	20,415	1873	118 605	1881	351,206
1866	74,773	1874	99 680	1882	502,513
1867	47,303	1875	297,147	1883	324,717
1868	152,418	1876	142 799	1884	295,039
1869	286,753	1877	157,159	1885	383,756
1870	169,791	1878	318,071	1886	402,121
1871	157,107	1879	158,393	1887	742,445
1872	211,916	1880	238,928	1888	953,580
				1889	915,573

It is to be regretted that the totals of apple and peach brandy are included in the figures given, but this cannot be avoided from the manner that the records are kept. The total of brandy from these sources in California is very small—so small, in fact, as not to be worth consideration.

LONG DISTANCE POWER.—One of the features of an electrical exhibition at Frankfort, Germany, is to be the transmission of power (500 horse) a distance of 140 miles. It is not pretended that this can be done economically, but the mere doing of it will be one of the wonders of the exhibition.

POULTRY YARD.

The Hatching Season.

EDITORS PRESS:—The time having now arrived, or nearly so, for the fall hatching, perhaps a few words of "experience" and direction may be appropriate and be of assistance to some one. With poultry-raising, as with many other things, there are certain matters which it is necessary to keep in mind in order to insure success, and the only way to do this is to keep in constant practice or to keep well supplied with good practical poultry journals made up of the experience of thorough and successful poultry-raisers who know of what they write and do not give mere theory or hearsay which serves so many times merely to mislead and bring to grief those who adopt it for their guidance. It is always well to experiment wisely, as in this way we possess ourselves of valuable knowledge many times, but if we can, by informing ourselves of the "ways of those who know," arrive at the desired result, it often saves us much time, much useless expense and much worry.

I suppose that poultry literature or stock literature is, equally with other kinds, susceptible of being presented in more attractive and amusing form, and indeed I have read quite an interesting and entertaining novelette having for its subject-matter the doings of the denizens of the poultry yard, and in such a way much information might be pleasantly imparted; but after all, "dry facts" serve the earnest seeker perhaps quite as well, and are easier written or told, so here goes for dry facts.

In my last I talked mostly of incubating, and so long as incubating is followed there will always be something to learn and something necessary to say about it. The conditions of each hatch seem to differ, and sometimes very materially, owing sometimes to difference in the condition of the eggs or to difference in the outside temperature which may be sometimes excessively warm, at other times cool or windy or damp and overcast. All of these different conditions necessitate different treatment of the eggs in process of hatching—a little less or more of heat or moisture or a little more careful closing of the room or house where the incubator is kept.

One great difficulty is to find coal oil of the requisite quality—oil which will not crust the wick or cause the blaze to flicker or rise and fall. I have used all of the finer brands, any of which have done finely until, perhaps, I would get hold of a case which I could not use, as, in spite of all care, it would give off fumes which were not only plainly to be noticed in the room, but in the egg chamber also to the manifest harm of the eggs therein. For this reason I do not think that any particular brand can be recommended as fully reliable. I use now, as I did once before for a long time, "Pratt's Astral," and find it quite as reliable as any and quite a third less expensive. I use it for both incubators and brooders, except when I use hens as brooders, and as a matter of fact I do then, spraying them lightly if there is a suspicion of lice; but if this is done it must be done with great care, as if used at all freely it may cause the loss of sight of the chicks they are brooding. Perhaps the use of insect powder would in many cases be less likely to result in harm to the chicks and the less objectionable.

I have noticed that where women conduct the incubating, they, true to their character as careful managers, invariably have the machine or machines in the house, if not in their sleeping-rooms, where they can watch it closely through the night, getting up at least once to look at the thermometer in the egg chamber, no matter how self-regulating the incubator may be. This is a very safe precaution, for often the regulator itself needs regulating, according as the night turns cool or warm. I have not yet seen an incubator whose inside temperature—that is, of the egg-chamber—was not more or less susceptible to change in the outside temperature, making it necessary to raise or lower the flame of the lamp furnishing the heat as the room got cooler or warmer.

I think that a house intended as an "incubating" house should be built in such a way as to be as independent of changes in temperature on the outside as possible, and be well ventilated, as, for instance, thick walls and floor and well ceiled. Many windows are not needed, and they might be double-glass, with the sash constructed in a way to admit of it, thus having a space between the inside and outside panes as one sees them in incubators where a little "window" is left for the purpose of allowing one to see the thermometer in the egg-chamber and to see the eggs as well; then for ventilation there should be means of slightly warming the air before it enters the room when the outside air has a chill in it, or it would be difficult to maintain an even temperature in the room, and this might be arrived at by means of pipes from the outside at the bottom of the room and continued to the ceiling, thus causing the cool air from the outside to mix with the warm air at the top and become tempered to the right degree.

This I take to be a much better plan than having the incubator in one's bedchamber or even in the house, for although it may not be unhealthy, it certainly has its inconveniences, not the least disagreeable of which may be considered the odor arising from the flame of the lamp and that thrown off by the eggs in process of incubating, and, in very warm weather, the added heat. On the other hand, if one really means to neglect no possible duty to the future chick and among these duties finds that of getting up once at least during the night to see that everything is going on rightly, then having the incubating done in the house might be considered preferable to the necessity of going outside, particularly in bad or cold weather.

The many failures of beginners are, in the majority of instances, to be traced to the lack of careful observance of detail, and seemingly many times they have to learn by dearly-bought experience that if they would be successful they must be careful to leave nothing undone that should be done, no matter how fussy or unimportant it may seem to them. As they become "older hands" at the business, they will find that attention to detail pays in poultry-raising, as in fact it does no doubt in any and all kinds of business, but perhaps more noticeably so in "chicken-raising," and the superiority of women as poultry-raisers is due to the fact of their greater care in attention to small matters.

Chickens are small things, and a little care or a little neglect tells sweepingly for or against their well-doing, and consequently for or against the interest of the would-be poultry-raiser, more particularly now that we have such low prices in poultry to contend with in consequence of the oversupply of cheap Eastern poultry and eggs. Although really choice poultry and eggs bring as yet a fair profit, and while they are becoming perhaps still cheaper, we must learn how to raise them in a less expensive manner and be able to thus put them on the market at competition prices and still realize a living profit.

My former practice was to raise my chicks wholly by artificial brooding and yarding, but I have since somewhat gotten out of the practice and have used more and more the natural brooders—good, motherly, careful old hens—and allowed them to run at large, keeping, however, as I have before said, the hen confined in a coop (if found advisable) which the chicks can run in and out of at will, and if one selects good hens and keeps all free from lice, I think that in the greater number of instances one raises a larger percentage of chicks than by artificial brooding. My method is to set the requisite number of hens some time during the incubating process, say at any time before the last week, and when the chicks come off give them to the hens, who, almost without exception, take them with great satisfaction and go at once to scratching for them.

The fault with the generality of artificial brooders is their lack of the means of furnishing the chicks a proper supply of fresh air and necessary warmth at the same time, and unless this is done the coming off in the morning into the outside air is a time of great danger for them, especially if it should be somewhat cool, as being warm and sweaty from their close, warm quarters they chill and it results in diarrhea and consequent loss of a great part, if not all, of the chicks.

Great care should be observed in the matter of air and warmth for the chicks during the night. Not too warm, or it weakens them and retards their growth, nor too cold, or you chill them, and in either case you have a chick which does not pay you to raise, as it never becomes a good fowl.

I am still incubating and using hens as brooders, and shall continue to do so through the winter, or until I find, as possibly I may, that artificial brooding is more profitable during the wet, cold months when chicks cannot be allowed to run out at all times as they may in the warm, dry months. I intend to test it, and can speak of it by-and-by more understandingly, perhaps. At present I am decidedly in favor of Mrs. Biddy as a brooder, but prefer the incubator as a hatcher because it is always ready for duty, hatches a greater number than a hen or many hens, does not consume as much, and admits of more hens laying eggs, which would be otherwise setting, and is also less trouble to one than the care of setting hens, which one has to feed and water and keep clean and free from vermin.

I have so far found Langshan hens to be the best mothers, and I am almost of the opinion that taking the whole year through, winter and summer, they are the best layers, which I am aware may to some sound like heresy and an unwarrantable attempt to dethrone the Leghorns, who seem to have reigned supreme as the laying fowl, but my Langshans lay when the Leghorns do and they lay when the Leghorns do not, and so far 100 Langshans have given me more eggs than 100 Leghorns. I am inclined to think, however, that the Langshan being a quieter fowl, stands confinement in yards better than the Leghorn, and when allowed free range the Leghorn might be the best.

With the Leghorn we get large white eggs, which seem to be in more demand than dark ones, although the darker ones are much richer and more nutritious, and the old saying, "For eggs to beat into a light, stiff froth, choose white ones, but for frying or kindred purposes choose always dark ones," still holds good.

When the census returns are in and published, if the number of fowls in the State is shown, I think that if means can be found of comparison with past years, we will see that the number is many times multiplied, as each day seems to find some new hand at poultry-raising, and the cry of overproduction begins to be heard, but many years will pass before that result is reached. I don't fear that as much as I do the Eastern evil, and that, as I have already said, can be met, I think, by practicing a greater economy in our conduct of the business, raising our own feedstuff. Young growing fowls can, I find, be fed almost entirely on green stuff chopped, such as carrot-tops, cabbage, green corn, turnip and onion-tops, etc., some of which may, if thought necessary, be wet and sprinkled with middlings.

T. B. GEFFROY.

Lodi, Cal

Poultry Disease.

EDITORS PRESS:—I have had several deaths among my poultry the last few days; perhaps some of your valued poultry correspondents can enlighten me as to the cause and cure. They have been fed as usual, and there have been no deaths previously for some time. They droop for a few days and die, and those attacked ranged from half-grown to two years old. On opening the crop, it was full of stringy, slimy, *watery stuff* mixed with wheat that they evidently could not pass along. There has been no change in their usual food, and they have no access to foul or dirty water; they were not confined, but had the range of some 20 acres. What is the trouble and the cure?

Otay, San Diego Co. J. M. C. MOORE.

FORESTRY.

Acacias for Tanbark.

EDITORS PRESS:—The experiments in the cultivation of various species of acacia (the so-called wattles of Australia) in South Australia and Victoria, for the production of tannin, have proved eminently successful, and is being carried on as a profitable pursuit.

Mr. J. H. Maiden, F. L. S., in his "Wattles and Wattle-barks," gives full and interesting accounts of the various tannin-producing acacias, with tables of their comparative values for that purpose.

Some of the landed proprietors of Southern California are beginning to look into the matter with a view to the extensive planting of trees suitable for furnishing tanbark. This, by the way, is one of the things which should be worked up for the benefit of the State at large.

There are many thousands of acres of land in California which are better adapted to the profitable culture of trees for tanning purposes and plants for fiber than for any other purpose.

The successful introduction of these industries means a large increase in the productive wealth of the State, and they should be experimented upon by our Government Stations as well as by individuals.

The latter, while testing the capabilities and prospects of these industries, may not only demonstrate the possibilities but, at the same time, if only the best trees and plants for the purposes be selected, make for themselves a source from which they may receive profitable and readily available returns for the outlay of time and money involved.

The tannin-producing acacias or wattles are natives of Australia, where they grow in the poorest soil and require but a moderate rainfall. The trees begin to give returns in from five to seven years.

A statement compiled from evidence given before a "Board of Inquiry on Wattle Cultivation in Melbourne," shows that 100 acres of wattles may be made to yield a profit of about $10,000, after paying for the rent of the land and expenses.

The trees are planted 10 feet apart, and at the expiration of five years every third tree is stripped and a new tree planted in its place. This is repeated for the next two years.

After this, two years of waiting for the new growth of trees to come to maturity; so that after the first five years, three years out of five yield bark in large quantities, while the intervening or off years yield something from the trimming of the young trees.

The matured bark of the black wattle (*Acacia decurrens*) yields from 15 to 36 per cent of tannic acid.

The bark of the broad-leaved wattle (*Acacia pycnantha*), as high as 46 per cent of tannic acid, and many other species yield tannin but in less quantities, some as low as 2½ per cent, but these are classed as "worthless."

Hence it is very important that seed of the proper species for planting be obtained.

The writer has just received some fresh seed of two of the most desirable species, for experimental purposes.

LORENZO G. YATES, F. L. S.

Santa Barbara, Sept. 15, 1890

[As we remarked in a recent issue, the black wattle is already widely distributed in this State and is seeding freely. The University has sent it out to correspondents for the last five years. The tree does remarkably well in many parts of the State.—EDS PRESS.]

SHASTA COUNTY FAIR.—We are indebted to the officers of the 27th District Agricultural Association for a "season complimentary" to the annual exhibition to be held at Redding, 23d to 26th instant, inclusive.

PATRONS OF HUSBANDRY.

In our Rural Press Official Grange Edition, issued every week, will be found all items matter from this and other periodicals of special and importance to Patrons. Any subscriber who wishes can change free to that edition.

In a Very Few Days.

Promptly at 10 A. M. Tuesday, Oct. 7th, Worthy Master DAVIS will doubtless call the 18th Annual Session of the State Grange of California to order. It convenes at Watsonville, in the rich, fruitful and healthful Pajaro valley. Within a radius of 30 miles are the flourishing towns of Hollister, Gilroy, Santa Cruz, Castroville and Salinas, and within about 50 miles are San Jose (the Garden City of California) and the historic town of Monterey.

The citizens of Watsonville, inspired by the grand hospitality extended the National Grange by the State Grange of California last November, have outdone all former State Grange occasions in their invitation of welcome and program of choice social, educational and friendly offerings.

Watsonville Patrons and citizens beckon us all with wide-extended arms. Let us not disappoint them in our numbers, but greet them with an overflow of our noble-minded Order.

If any are wavering in their minds as to going to Watsonville, let them give the benefit of the doubt on the safe side for securing recreation and experience that will uplift the better lines of life for all time.

Our Good Waterloo.

EDITORS PRESS:—Last Saturday I had the pleasure of visiting Waterloo Grange, which was a great treat. There were 62 members present (with nothing special to attract), the majority young people, yet enough whose hairs are silver to add dignity to the assembly.

I doubt if there is a Grange in the State whose members take more interest in the Order. That they have been well instructed is evident by the prompt and easy manner in which they dispatch business.

Seven applications for membership were made that evening, which proves that work is being done outside as well as within the gates.

Under the head of "Good of the Order," the Lecturer made some well-timed remarks and tried to impress upon every member that it is far better to see how much each one can do and not how little. Then a very entertaining literary and musical program was rendered by different members. This was followed by lots of good advice and encouragement from Bro. P. M., Overhiser, who also spoke of the RURAL PRESS and secured six new subscribers.

After the Grange had closed, the young people amused themselves for an hour in tripping the light fantastic, while the older members indulged in a social chat.

Long live Waterloo Grange, and may it continue to increase in membership and influence! May Bro. O. be the means of instituting another Waterloo Grange soon! Fraternally,

A VISITOR

Rally at Selma.

To flank the circus, the conference meeting of Patrons, farmers and Alliances at Selma was set for Saturday, September 27th, at 10 A. M. There should be a large gathering to greet the old war-horse and General Deputy, C. J. Cressey. His immense fund of good humor and sensible farm and home talk is worthy of a large audience. No one goes away disappointed wherever the Worthy Treasurer of the State Grange speaks. His words are full of attraction and encouragement for the weary toilers—Husbandmen and Matrons. Do not fail to hear him.

Although no encouragement had been given him up to the close of last week, Bro. Cressey, as General Deputy of the district, determined to visit and interview the members of Lucerne and Hanford Granges some time this week; also to go to Visalia and view the field there as to the feasibility of reorganizing the Grange at the county seat. We wish him success.

A Hearty Invitation

From Generous Watsonville.

In the center of Pajaro valley is the gem city, Watsonville, and many of her citizens are busily planning how best to entertain the State Grange.

Among the proposed features are a free excursion and clam-bake (the genuine quahaugs are found in abundance along the beach), free carriage excursion and barbecue, plenty of music and other entertainments, numerous souvenirs, etc.

They all join in the invitation to all Grangers: "Come and bring your friends with you; make an old-fashioned New England visit and stay a couple of weeks, for you can live here cheaper than many do at home—plenty of the best for all!"

The Master's Desk.

B. W. DAVIS, W. M. S. G. OF CALIFORNIA.

Hoi for the Seaside.

If you belong to the Grange, you are specially invited to join the "crowd" and be at Watsonville Oct. 7, 1890. There will be a great many there, but "the more the merrier," so come along. Bro. Roache is preparing entertainment for all, and for *one more* there will surely be room. Just consider yourself that one, and, before you start from home, go to the garden or granary, go to the library or larder, go to the field or flower-bed, go to the orchard or go to the newspaper—at least go somewhere—and select a few choice thoughts. Don't go to Watsonville empty-handed. Take an offering, and if some one does not give you an idea, I'll be mistaken. At any rate, you will be duly and truly prepared to give them ideas, and we are taught "it is more blessed to give than to receive."

Idle Hours.

Did you ever stop to think how much of your own life has been spent in idleness? It matters not how busy a life you may have led, there has never been one day when there were not idle moments. Idleness is not a companion that will help you to be a bigger man than you would otherwise be. There is no loss of time in taking reasonable rest; but even when one is resting from *physical* exhaustion, there may be some pleasant and profitable *mental* work going on. So, too, when one is mentally tired, then may be found pleasant, light, physical employment. The hours of sleep and perfect rest are not hours of idleness. The hours to which attention is called are not these, but those when one might be doing or saying something useful. If the idle hours of life were but fully utilized, how much good could be done! If the idle hours of the Grange could be utilized (not that they are more plentiful than in other Orders), how the Grange might be benefited! Let us utilize *idle* hours, and see how many new Granges can be organized!

Tariff or Free Trade?

That is the question, but don't let any party, or any unworthy man, put a tariff on your vote or make free trade of your rights. Stand for your country, vote for the best men, and protect your family and property rights. That is what farmers want. That will give all industrial interests Protection and Free Trade at one and the same time, and no one will be sufferer unless it be the ward politician, and his interests the farmer is not bound to protect.

Our Government pensions and assists loyal and disabled soldiers and sailors, and it is proper and right and its *duty* so to do. To do this, laws were passed. Now let Congress pass suitable, reasonable and proper laws to protect and assist that largest class of its citizens who pay so heavily of taxes, viz., the farmers. Don't think the farmers ask for more than a fair share. All they want is an even show. No class legislation—just general, wholesome and equitable laws, that's all. Even the "Old Fellow" is entitled to his due.

This is a period of agitation! No farmer who wants good government, pure homes, intelligent citizens and equal and exact justice for all, can afford to hold aloof from a farmers' organization. His patriotic duty calls him to the front, his manhood is appealed to, and he should unite, with voice, vote and fellowship, to bring about needed reforms. The generous citizen will not fail to do his share in times of public calamity. The faithful farmer has now an important duty to perform. Let him study well the situation; let him inquire into the merits of all the agricultural organizations, and then—he ought to conclude to join the Grange, and with the many other patriotic Patrons battle for the right.

A clear conscience, a duty well performed, a smile, and now a tear, are all good tonics. Try them. They will befriend you when patent medicines fail.

Practical education means honest elevation in the scale of manhood and womanhood.

The fairest of the Native Daughters of the Golden West are to be found in the Grange of California. The young farmer who wants a wife, *provided* he is a No. 1 young man, might do well to happen down Watsonville way early in October next.

"If you are waking, call me early," for I want to be at Watsonville the first Tuesday in October.

"Of all sad words of tongue or pen
The saddest are these, it might have been."

And you'll think so if you miss the good time prepared for you by the members of Watsonville Grange.

"Let us then be up and doing, with a heart for any fate,"
Be sure to be at Watsonville, and *be sure* not to be late.

Brother H. E. Hayes, Worthy Master of the Oregon State Grange, may be expected at Watsonville. He and Sister H. will come via California on their way to Atlanta.

A Delightful Missive from Japan.

EDITORS PRESS:—Regularly the steamships across the Pacific bring the RURAL PRESS, and I assure you its bright pages are welcomed and appreciated in our home in this Grangeless land. We read with great pleasure the inspiring weekly jottings of the State Grange Master, the accounts of Grange meetings and picnics and the well-expressed opinions of thinking Patrons and Matrons on the burning questions of the day.

As we read, the longing comes ofttimes to be back again in the thick of the Grange work and toiling with beloved fellow-Patrons for farm and home and native land. Some of your regular contributors seem already like old friends, their names have become so familiar, and we find ourselves wondering how does this brother or sister look, and have they a good Grange grip for a fellow-member of the Order.

It is pleasant to think that an ocean ride of less than three weeks would at any time take us to the hospitable Golden State, where Patrons are many and warm-hearted and we should feel at home. But our work for a season is here in the north of the "Land of the Rising Sun." There is a great work to be done here "to elevate and dignify our calling," and yet here as elsewhere agriculture is bearing the great burdens, feeding and clothing the people, supporting the Government, furnishing factories and commerce with their materials—all these and more—by a stupendous amount of slow, drudging manual labor, with the aid only of the rudest implements, except where in this new North country foreign implements and machines are gradually coming into use. It is a sad thing to see agriculture so reduced, as it is here in the Orient, to a dull, unthinking plodding in the wake of sleeping centuries. It was time, indeed, that the strong rays of the setting sun, reflected from the "Land of the Occident," roused these people from their long slumber!

We have here at Sapporo an agricultural college which at the start was modeled after the Massachusetts Agricultural College. Some of your readers doubtless remember the mission of President Clark, under the auspices of the Japanese Government in 1876, when he came to establish this college in Yezo. He laid the foundations solidly, and they are lasting and a lasting testimonial to his strong and noble character. The superstructure has been somewhat changed and added to, in order to adapt it to Japanese conditions and time's progress. We have about two hundred students in collegiate preparatory and practical departments. Yezo is, in a certain way, the California of Japan. It is a new country, opened to settlement only about twenty years ago. Here are mountains with, they say, exhaustless beds of coal, and from these mines coal has even been shipped to San Francisco; so you see that, after all your boasting of your big and wonderful State, you are dependent on us to keep you warm on chilly days.

This is a great island of mountains, valleys and plains. Many fine rivers furnish salmon-fishing, which has become an important industry here in its season. Sulphur as well as coal is mined. The valleys and valley plains, though not all adapted to agriculture, yet contain many thousands of acres of fertile land which, had the Japanese been as eager as Americans are to enter and subdue, would long ago have been taken up and developed into a thriving agricultural country. Large areas are splendidly adapted to stock-husbandry, grain-growing and fruit culture. The mountain-sides and much of the lowlands are covered with forests, and timber in considerable quantities is being taken out.

We are sure of several feet of snow throughout the winter, and although that may send the shivers down the spines of your tender Californians, nevertheless it is very enjoyable, for it gives us good sleighing and snowshoeing. Much as some of your roses-all-the-year-round, strawberries-every-month-in-the-year people delight to laud the mildness and salubriousness of the great but gentle Pacific State, I know some of your New-England-born denizens would enjoy a trip, some crisp February morning, up one of these mountains or out over the fields and through the woods on the hard snow crust. There is inspiration in every creak of the frosty crust under the snowshoes for a true New Englander, and it does not in the least lessen his appreciation of the bursting buds and green leaves and pleasant fruits that come later "in their season." If we only had one good, hearty Grange here, our contentment would be very great. It will take some time to prepare the actual agriculturists for the Grange—that is, for realizing the higher objects of the Order. I have faith in the P. of H. and its future, however, and believe it will yet spread world-wide, not doing the same work in all countries, but accomplishing *some* good work in each, according to conditions. I have been greatly interested in the call for the Grange in Australia, and hope to hear soon that the Order has begun its quiet but effective work in that fair land.

May you live, Messrs. Editors, to report in your progressive Grange paper the proceedings of the first and many succeeding meetings of the Granges of the world, where from countries many, faithful and intelligent tillers of the soil shall come to consult and confer together "for the good of our Order, our globe and mankind." Pacifically and fraternally yours,

ARTHUR A. BRIGHAM.

Agricultural College, Sapporo, Japan, Aug. 11 1890.

Achievements of the P. of H.

In addressing the great concourse lately held at Williams' Grove, Hon. Leonard Rhone, W. M. S. G. of Pennsylvania, reverted to O. H. Kelley's tour in the South to inquire into the farmers' condition soon after the close of the Civil War, at which time he complained of "a great lack of interest on the part of farmers—a visible want of energy on their part to favor progressive agriculture." But in August, 1867, he wrote to his friend, Wm. Saunders: "I think we can revolutionize all this, and I suggest the organizing of an Order to embrace in its membership only those persons directly interested in cultivating the soil." After outlining the principles of the proposed Order, he went on to say: "The grand head of the organization will be an auxiliary to the Department of Agriculture, and as soon as this shall become a permanent department, *with its Secretary* in the Cabinet, it seems to me Government can aid materially in advancing the agricultural interests of the entire country."

In summarizing the work accomplished by the Grange in its life of three-and-twenty years, W. M., Rhone mentions the following facts: The Secretary of Agriculture has been seated in the President's Cabinet; railroad rates have been reduced, discriminations prohibited, Commissioners appointed in some States, and laws, State and National, enacted to protect the people from injustice in the matter of transportation, and against the manufacture and sale of oleomargarine and kindred stuffs as butter. In Pennsylvania, at least, they have doubled the appropriation for public schools, and thus relieved the farmers of the State from the payment of $1,000,000 taxes.

"This," he says, "is a record of work accomplished in which any organization might take pride, and it demonstrates that the farmers of this country are as capable of intelligent action, when acting together, as any other class, guild or profession.

"But our work is not done; it is still in progress and but partly finished. There still remains the need of persistent and well-organized effort. The grip of corporative power is by no means relaxed; fertile in resources, fruitful in schemes and determined in action, it has armed itself with all its powers, not only to resist any further demands of the people, but to nullify the work already done.

"How are we to cope with this formidable power? By organization. If the farmers will come into the Grange and stand up manfully for the principles of the Order, which has already done so much for their amelioration, these giants which threaten to devour us can be changed into tractable servants. There is no time to waste! The battle is on, and we must not only align our forces but secure new recruits as well. We need the help of every farmer in this broad land in this struggle for the right, and if the proper effort is made we can have it."

From S. G. Lecturer.

EDITORS PRESS:—The Arroyo Grande Grange held a meeting on Saturday, the 20th, and conferred the third and fourth degrees on a class of seven. There were several others who should have received the degrees but failed to put in an appearance.

After degree work was over we had a Harvest Feast and open meeting. Bro. Webster and other speakers expected all failed to materialize, so we had to depend on local talent. Suffice it to say, we had an enjoyable season, "a feast of reason and a flow of soul," as well as plenty of good things to eat.

We elected as Alternates to State Grange Capt. Marcus Harloe and his good wife. Several of our members contemplate attending State Grange. Unfortunately, the Arroyo Grande Agricultural Fair will be in session at the same time as the State Grange, so a number of our members will be kept at home on that account.

A number of the Arroyo Grande Patrons and Alliance men clubbed and purchased their bean sacks of our local merchants at a reduced rate, thereby making a saving of several hundred dollars. Fraternally, GEO STEELE.

Edna S. L. O. Co., Sept 22, 1890

From Eden Grange.

EDITORS PRESS:—At the last regular meeting o' Eden Grange the communications from the State Secretary's desk were read and duly discussed, also the duplicate from Stockton. An interesting talk on insurance management by Bros. Blackwood and Adams, resulted in Bro. Adams offering the following resolution, which was unanimously adopted by the Grange:

Resolved, That the State Grange pass resolutions instructing the Committee on Legislation to use their best endeavors to have laws passed at the next session of the Legislature under which mutual fire insurance companies may be organized.

Fraternally. JOSIE SHARAI, Secy.

Haywards, Cal., Sept. 21.

Gridley Grange and Harvest Feast.

EDITORS PRESS:—The charming little city of Gridley is situated within a few miles of Butte county's southern border and just over the line, as it were, of the northern border of Sutter county. It stands in the midst of one of the richest and most attractive sections of Butte county, if not of the State, and is owned and cultivated in small subdivisions by as prosperous and enlightened yeomanry as blesses any country under the sun.

The writer was more familiar with the locality when it was a sheep range, 30 years ago, and when the first isolated settler began to encroach upon the usurpations of the sheep and cattle kings, than for the past 15 years or since the country began to be developed. To one so situated the transformation is always more impressive than to those who grow up with the country; hence the displacement of the settler's cabin by the imposing dwellings, the well-cultivated fields, the ever-present groves of fruit, shade and ornamental trees, which in many instances completely embower the cosy residences, aroused in me an admiration never thought possible, according to my earlier recollections. The cereal industry having reached its zenith, the fortunate possessors of the soil are turning their attention to fruit-culture and with marked success; thus the orchard, vineyard and orange groves are rapidly reducing the wheat acreage, so that the wildest fancy cannot picture the situation as it shall appear ten years hence—at least *I* will not attempt it.

Saturday morning, Sept. 20th, wife and I took an early start by team and for 25 miles drove along in Sutter and Butte counties, through the matchless country referred to above but not described, to Gridley—one of the handsomest and most prosperous towns in Northern California. The first glimpse revealed an unusual commotion and the chance acquaintance soon wanted to know "what's up," or whether the wicked Grangers had resolved on taking the town. The rush to and fro was explained thus: The hall where the meetings were being held was found to be inadequate, and the managers had accepted the use of the Masonic hall which has that necessary adjunct, a banquet-room. After many greetings extended to the numerous visitors who hailed from March, North Butte and Yuba City Granges, Worthy Master Biglow placed his gavel in the hands of Bro. B. F. Frisbie, District Deputy, who presided with his customary grace and ability. The third and fourth degrees were conferred on two brothers and two sisters in a successful and impressive manner, after which the fair Matrons took possession of the masculine portion of the audience and marched them about the hall to inspiring music. In due time exits were revealed, and there we stood in the presence of a feast never to be forgotten while mind sits upon her throne. It was the first attempt of Gridley Grange, and her talented sisters are certainly entitled to the belt. Only a few hours previous had I seen the State pavilion at Sacramento, with all her glorious exhibits, and yet this display of the products of the orchard, vineyard and garden was not excelled, if indeed it was equaled. But this so grand in beauty and proportions was only a side-show to the victuals and cookery so richly displayed upon the two long tables. There was chicken, ham and other meats in abundance; there were pies and cakes in endless variety and quantity, with coffee and tea or ice-water to facilitate the operations of the banqueters; best of all, there was a grand supply of old-fashioned, home-made pumpkin pie, the handiwork of Sister May Fagan, a charming youthful member of this young Grange. The pie was as handsome as a picture and even better than it looked, and received universal praise.

The gustatory exercises, interspersed with merry-making and repartee, put every one in the best of humor, which accompanied the audience back to the main hall where the spirit of sociability, fraternity and fun held sway for hours. I think I never saw so much real, hearty enjoyment crowded into a single occasion. Every one appeared to be warmed up and inspired with hilarity. It was the general remark that the absentees missed a rare treat, and all seemed spellbound to the hall, though the sun began to show an inclination to hide behind the Coast Range. At the breaking up of festivities, three hearty cheers and a tiger went up from the visitors for Gridley Grange; the hosts responded in kind, and then this scribe and his better-half departed for their home, where they arrived in good condition at 7:30 P. M., the tiresomeness of their long, dusty ride completely overcome by the enjoyments of the day. Fraternally, GEORGE OHLEYER.

Yuba City, Sept. 22, 1890.

[We can well believe the Gridleyites and their guests had a fine time last Saturday—our Grange folk generally do when they can "rope in" our correspondent, the worthy old hero of the anti-debris cause.—EDS. PRESS.]

BOUND FOR WATSONVILLE.—Besides those mentioned last week as likely to attend State Grange, Bennett Valley expects to send five or six members; San Jose, 10 or 12; American River, 10 or more; Danville, 8; Pescadero, 12; Washington, 6; Kibesillah, 2; Walnut Creek, 5; Paso Robles, 2 or 3; Sebastopol, 3 or more; Selma, 3 or 4; Rosevile, 6.

Pescadero Grange.

EDITORS PRESS:—Pescadero Grange is surely making progress. The third and fourth degrees were conferred on a class of seven, the 6th inst., and on the 20th, at the largest meeting of the season, the first and second degrees were conferred.

The third and fourth degrees are to be conferred on the first Saturday in October, to be concluded with a Harvest Feast.

All Patrons in good standing are cordially invited.

Dormant members are returning to the fold, and the work of the Grange is being more thoroughly appreciated by the people in this vicinity.

Patrons of Husbandry thoroughly imbued with the purposes of our Order know that a true and noble manhood and womanhood are developed by faithful effort to make them practical.

Why should we falter in the effort to do good when happiness results from such effort? Why should one Patron hesitate when others falter? It is the faithful worker who gains strength to overcome difficulties. *Progress* in a high sense *demands devotion to principle.*

I. C. S.

Amendment to the Constitution Adopted.

NATIONAL GRANGE, P. of H.,
Office of the Secretary, 514 F street,
WASHINGTON, D. C., Sept. 17, 1890.

Proclamation.

WHEREAS, I have been officially notified that the following amendment to the Constitution has been adopted by the constitutional majority of State Granges:

Amend Article VII by adding thereto the following:

Provided, That State Granges shall have the power to reduce the fees within their respective jurisdictions to any sum not less than one dollar for men and fifty cents for women;

I therefore promulgate the same, and declare said amendment to be a component part of the Constitution of the National Grange of the Patrons of Husbandry.

In testimony whereof I have hereto subscribed my name and affixed the seal of the National Grange this 17th day of September, 1890. J. H. BRIGHAM,
Master of the National Grange, P. of H.

William A. Armstrong,

The able and accomplished editor of *The Husbandman*, died at his home near Elmira, N.Y., Aug. 21st, after an illness of several months.

He was born in 1827, in the town of Hector, N. Y., where he passed his boyhood. He came to California in 1849, and spent five years in the gold regions. Since 1861 he had resided at Elmira, N. Y.

Mr. Armstrong was a practical farmer and for many years tilled the soil of his West Hill farm with profit, being at the same time a reader and student. He was one of the nine who organized "The Elmira Farmers' Club" 21 years ago, was the Secretary of the club and did a tremendous amount of work. As an outgrowth of the Club came the *Husbandman*, a weekly agricultural paper, started in 1874, with Mr. Armstrong as its editor.

He early identified himself with the Grange movement. For six years he did good service as Secretary of the N. Y. State Grange, and was for ten years its Master. In the Order he was recognized as a leader and his counsel was always regarded. He was a forcible and interesting speaker and his presence at Grange meetings was much sought after.

True and sincere in all things, his integrity could never be doubted. A warm personal friend writes: "His kind words and acts in which he never tired until prostration made him incapable of performing, will forever be indelible upon the hearts of the recipients. True courtesy was extended to friend and foe alike. Perhaps no man could be more missed in the circle in which he moved than he; his character was above reproach both in public and private life; he was generous to a fault and always felt that he had not sufficiently repaid a kindness."

Invite "Little Hero."

Bro. H. E. Hayes and wife may tarry several weeks in California. They are noble, straightforward writers and speakers and should be detained by large district and union meetings in various parts of California. Appoint committees for holding union meetings just after the State Grange and invite them, and you will have a glorious time with the Oregon Master and most magnetic organizer.

LECTURE IN OAKLAND.—Rev. Mr. Goodenough, pastor of Oakland Universalist Church, lectures in Hamilton hall under W. C. T. U. auspices, Saturday of this week, and James G. Clark, the poet-singer of America, will be present to sing some of his original reform songs, such as he is known by all over the land, and has sung at State and National reform conventions throughout the East.

Oregon State Fair.

NUMBER I.

[Written for the PRESS by MRS. I. L. HILLEARY.]

The first day of the fair opened with favorable weather, morning cool and atmosphere hazy with smoke, as it always is at this season of the year.

The crowd was large for the first day and the receipts at the gates over $1400. These two news items soon spread and every one wore a cheerful countenance. The society and the people felt that success would crown the effort of 1890. The camp-grounds were literally packed, and as Sec'y Gregg expressed it, everything was "a howling success." The people of our grand old State came from its every part, bringing with them the products of our rich soil and wondrous beauties—the fruits of man's invention and woman's tireless hands. Even Salem, the sleepiest city of the State, was in holiday attire; flags were swung to the breeze, show-windows were a study, grocerymen's shelves groaned beneath their loads of vegetables and fruits, and the city of schools, churches and piety really did put her best foot forward and prepared to receive the pilgrims, numbered by thousands, who came to tarry for a day at her door.

The State Agricultural Society

Was organized in 1860, and held its first meeting in Clackamas county, near Oregon City, on the farm of P. M., Rhinearson. This was its place of birth, and from the child of thirty years ago it has now grown to man's estate. Those struggling pioneer days were wondrous and full of promise; but as old Father Time garnered the years, trials came, disappointments multiplied, indebtedness piled up, the people lost confidence, and for a time it seemed as if the Agricultural Society as an organization must cease and the Industrial Fair of Portland take its place. But "the mists have rolled away" and the fair is "altogether lovely." The press and the people of Oregon can say, of a truth, the fair of 1890 is a success.

The Pavilion.

E. M. Waite was set as general supervisor over the pavilion, and had it ceiled and painted inside and out. This gave an air of cleanliness and thrift to the whole, which aided greatly in the general effect when the exhibits were placed in position; for it is well known that a work of art loses half its beauty if hung in a barn.

The Merchants of Salem

Showed their public spirit and energy in making several fine exhibits, among which we found creditable and tastily arranged displays from the firms of J. C. Brown, Crawford, W. Brown, Geo. F. Smith, and Krausse.

The Salem Woolen Mills exhibited a very fine lot of blankets, cloths and flannels.

The Salem Flouring Mills had a pyramid of 50-pound sacks of flour.

Singer and Davis sewing machines had each an excellent showing. The work was artistic and beautifully arranged.

The Art Department was never better. Prof. Clyde Cooke of Salem had a quaint, unique and handsome painting—the study a great quiet grove and a young musician listening as the echoes of his flute die away in the depths of the forest. In portraits, that of Mrs. Olive Stanton Eagland, life-size and regal in its bearing, is a central attraction. Next comes a hand-painted mirror, by a Kentucky belle, that elicits much admiration and some comment. But in this department there are altogether too many pieces worthy of mention to attempt anything like a general write-up in an agricultural paper.

The display by the ladies was extensive, and more new and exquisite articles, lovely, rich and artistic in design, were on exhibition than had ever before appeared.

Pomona's Output.

For the first time in the history of our Order in Oregon, Marion County Pomona Grange has lent the helping hand. The exhibit by this Grange, taking all things into consideration, is well worthy of praise, and, like the "potato" show of the Oregon Experiment Station, was a central object of observation from its uniqueness. Here we have the different grains displayed, not in sameness, but in almost wild array. Luxuriant specimens are shown of the growth from one kernel, giving roots and heads, as pulled from the field. Then there are great bunches of native grasses, the tallest on exhibition; timothy heads by the gross, a foot long; clovers, sunflowers, potatoes, squashes, melons, tomatoes, peas, beans, fruits, etc. Mrs. Martha Minto, that true sister of Salem Grange and courageous woman of pioneer days, has her wedding dress of 1845 for the curious to look upon. It is a light calico, with bright sprays of flowers, made with full skirt, hem one inch deep, infant waist and neck of the present day. Draped by its side is an apron 85 years old, of a style no mortal of this present age has ever seen worn. Sister Keene of Turner Grange exhibits a quilt, the neatness and finish of which the lassie of to-day cannot excel. Howell Prairie Grange certainly surpasses in her gifts to Pomona's exhibit those of any other Grange. Salem Grange stands second and Turner Grange third. We won't give away the name of the Grange standing fourth. A more complete report of this exhibit will be furnished, as seen by Hon. John Minto. Finally would say, Pomona's display, though not the best nor yet the most extensive, was a success and added greatly to the general effect of the various agricultural exhibits, and Pomona means to come again next year, her cornucopia overflowing with rich gifts from her fields.

Fruits and Vegetables.

D. D. Prettyman has charge of the State display of fruits, which is almost double that of last season.

John G. Wright furnishes the State display of vegetables, as was done last year, from the gardens of Savage, Whittaker & Chatman. Gardner Wright of Marion county has a splendid exhibit of vegetables, and the only reason why more of these displays are not made is simply because men cannot live on talk. It is too cheap, and it takes money to buy the baby a dress. Men go down into their pockets and pay from $150 down to $75 and $50 for a grain, vegetable or fruit display (county); but our Agricultural Society offers $25! Do any wonder at failures when this paltry sum is offered? Philanthropy is a good plant, but it won't "make the mare go." The Board of Managers should see with clearer eyes, and give with generous hands. From the Portland Board of Managers, an exhibitor of any article receives either a complimentary day ticket or a season ticket, according to worth of display. Even then, in the great city of Portland, the society is not "overrun by worthless entries." Thousands are left to pay toll at the gates. This very act of generosity is one secret of the success of the Portland Fair.

The State Experiment Station

Has the largest and best exhibit yet from its fields. One entire section is covered with potatoes, 425 varieties, clean and of average growth. A second section has 75 varieties of wheat and 25 of oats. A third feature is the lovely exhibit from the greenhouse. These, though not numerous in kind, are yet beautiful to look upon because of their luxuriant growths. A fourth and fifth feature of this exhibit are the grasses and seeds, all from the station and all cared for by the "boys" (?).

The society has on exhibition the usual assortment of grains and grasses from Lane county.

A. F. Miller exhibits for the N. P. R. R. grains, grasses, woods, etc., all looking fine. If this display had the same flourish of carpet and banner, as at Portland last year, it would be more than taking (If any mistakes are made in these rambling remarks please take no offense, but correct the same.)

There are general complaints at the small premiums offered for the products of the farm and the miserable arrangements and requirements of the premium lists. Kind does not compete with kind. For instance, one "peck of white beans," $2 and $1. In this, the little New York pea bean must compete with the marrowfat, the kidney and great Lima bean. Only *one* kind can take the premium. No farmer can enter a potato unless he raises three varieties. But, as our genial president, D. H. Looney, says: "We have outgrown our premium lists, they must be enlarged; we must grow and keep up with the times," so we may expect improvements before another year.

Notes on Fairs.

Bishop—Eastern Slope.

The "Eastern Slope" fair at Bishop was opened Sept. 10th. On that morning, says the *Inyo Independent*, nothing had been taken to the pavilion for exhibit. During the day loads of products and articles of all kinds kept coming in and the ground floor of the schoolhouse was fairly well filled. The fruits and farm products would do credit to any country. Grapes, apples, pears and other fruits of high excellence and beauty were shown, proving that the north end of the valley has a great future as a fruit-producing region. Corn was shown worthy of the virgin prairie soil of Illinois, and all other farm products were of equal excellence. A marked improvement was evident in all kinds of exhibits, live-stock as well as the produce of the orchard, the vineyard and farm, over the exhibits of other years. It is gratifying to every good citizen of the county to see that these fairs are producing their intended effect of stimulating everybody to constant efforts after greater excellence.

Santa Maria Valley.

The Santa Maria *Times* of 13th instant says: Our fourth annual fair, opening on Wednesday, excels all our previous efforts in display of farm products, fruit, flowers, fine arts, etc. The space of the pavilion was greatly enlarged this year, while the department for farm products was more than doubled. The entire space is utilized. The tables in the pavilion are all closely covered with the most magnificent display of fruits—green and dried—ever witnessed in Northern Santa Barbara county. R. D. Cruikshank, superintendent of the Experimental Station at Paso Robles, was on hand with a fine display of grain, consisting of 48 varieties of wheat, 18 of barley, 6 of spelt, 18 of oats and 5 of rye. The races have been quite lively, there being a good crowd present each day. At the pavilion there has been a perfect jam evenings and a fair crowd during the day. The baby show drew a crowded house.

THE National Committee of the World's Fair has selected Washington and Jackson Parks and Midway Plaisance as the site for the exposition.

Whatever Is—Is Best.

I know as my life grows older,
And mine eyes have clearer sight,
That under each rank wrong, somewhere,
There lies the root of right;
That each sorrow has its purpose,
By the sorrowing oft unguessed;
But as sure as the sun brings morning
Whatever is—is best.

I know that each sinful action,
As sure as night brings shade,
Is somewhere, some time punished,
Though the hour be long delayed.
I know that the soul is aided
Sometimes by the heart's unrest,
And to grow means often to suffer,
But whatever is—is best.

I know there is no error
In the great supernal plan,
And all things work together
For the final good of man.
And I know when my soul speeds onward
In its grand, eternal quest,
I shall cry, as I look back earthward,
"Whatever is—is best."

—*Ella Wheeler Wilcox.*

The Bounding Broncho.

There was a young man who came out to the West—
Came out from the East that is shop-worn and busted—
And much there occurred that troubled his rest,
But the chiefest of these was the broncho he trusted!

For that broncho he bucked, and that broncho he tore;
He tipped up behind and he reared up before—
This self-rising broncho, this tip-snorting broncho,
This broncho which made the young man so disgusted!

He mounted the critter to take a short ride,
And tried to start off with a Central Park trot,
But that broncho had cussedness stored in his hide,
And mentally whispered he guessed he would not.

Then he crooked up his back with a terrible hump,
Got up on his hind legs, proceeded to jump—
And the young man shot through the atmosphere—
Away toward the firmament calm and clear,
Far up among the stars so high,
That nightly wheel athwart the sky;
Up from this world of doubt and care;
Up from where bronchos pitch and tear—
This high-flying young man, this sky-scraping young man,
Who mounted the broncho which seemed hung in air.

—*Dakota Bell.*

His Proper Name.

[Written for the RURAL PRESS by MARGARET R. HARVEY.]

Young women—attention!

Oh, yes, I know—you've been lectured often enough and long enough by all sorts of people who seem to think that a joint was loosened in creation when *you* were made, and that it will never be tightened up again till they set *you* straight, just as if you weren't the sweet and sole hope of creation, precisely as you *are* for this world at any rate! What I have to say, however, won't hurt your feelings in the least; it won't make you feel a bit meaner or smaller.

It is this: If you ever marry, call your husband by his proper name—"Mr. Smith," or "Mr. Von Ettinghausen," as the case may be, "before company;" of course it is neither their business nor mine what you say to him in private or in the presence of the family or intimate friends. But before your next-door neighbor, your calling acquaintance, yea, even your pastor, speak of or to your husband precisely as you would speak of or to any other gentleman. Can you not see why? You thereby continually remind him and others that he *is* a gentleman; or, if he is not, you are determined to consider him such.

I know it sounds a little absurd to say "Mr. Morton" to his own relatives. But, even if you are his own wife, remember you cannot afford to give the impression that you are presuming too much; they knew him before you did, and might be the very first ones to resent the familiarity, particularly if they have not yet quite forgiven you for taking him away from them. (Oh, don't shake your head—there is more or less antagonism to every marriage in every family—the bride herself is likely to be the last person to suspect such a thing. At least she can't be too sure of her ground all at once.) If you call your husband "Charlie" before everybody, somebody will be sure to question, inwardly if not outwardly, why you don't say "dearie" or "honey" and be done with it. You can far better afford to call your cousin's husband "Charlie;" if you do, that shows that you have acknowledged him as a relative; it would be so understood.

And, naturally, you don't like to say "Mr. Morton" to young men and women of about his own age and yours, particularly if you were all schoolmates together. It is, perhaps, but a few years back when he was better known as "Bay Mule" or "Pud" or "Lunky." Let no parent suppose that his boy's baptismal name is in general use during the years between twelve and twenty. But suppose the boy has suddenly jumped into a man—the hobble-dehoy or pollywog period is amazingly short—that boy ought to be a man if he has a wife. Now, then, his wife has it in her power to say whether or not he shall be known as "Lunky" all the rest of his life. She can gradually define his position among his former schoolmates; it will not be many months before they will begin to call him "Mr. Morton," too. He need never be moved to write to a popular magazine, as did a gifted scientist a few years ago, that his attainments never won recognition in his native village because there he could never be known as anything but "Sam."

At this writing I recall the case of a worthy young man who declared that his good, old-fashioned name of Henry became particularly odious to him because he never could get beyond the sound and memory of "Hello, Hen!"

Every village, every boy's school, has its "holy terror," its "awful boy," the horror alike of babies, dogs and old people, the last predicting that he will surely come to the gallows (which he never does; he is more likely to reach the White House!). Your husband may have been that very boy. You can live down his past for him better than he can do it himself. Or, he may have been that other ubiquitous boy—the timid, sensitive one whom everybody said was a hopeless dunce, but who is destined to make one of those brilliant discoveries which have rendered American inventive genius respected the world over. You can show that you have faith in him before he takes out his patent. As soon as he has done so, your faith in him will be remembered.

Young women, I meant this for you; but older women may lay it to heart, too. I might quote a dozen examples to impress the lesson. I think of a dozen older women as well as younger ones who learned it in time for their own self-respect and peace of mind.

Does not every community contain a "reduced gentleman," who, left to himself, would soon degenerate into what may be remotely, if somewhat coarsely, described as a "soaker"? Everybody knows what reduced him—except, of course, his wife, whom the world charitably supposes to be quite ignorant of the fact that he *is* reduced. To her he is still the gentleman that he always was. She still calls him "Mr. Wharton," and so speaks of him. If she accidentally overhears some such expression as "Old Wharton was full last night," she innocently supposes that there must be another person of the name in town.

This man, strange to say, always has lovely daughters. These are received in the best society and generally marry well; but when there is a wedding in the family, "Mr. Wharton" is unable to stand up to give his daughter away. Is Mrs. Wharton disturbed? Not in the least, so the guests say. At the hour appointed for the ceremony, Mr. Wharton is safe in bed, with his door locked on the outside. Mrs. Wharton stands up before the assembled company and smilingly makes her graceful little speech:

"Mr. Wharton begs that his friends will kindly excuse him this evening. He is slightly indisposed and feels unable to appear. He has authorized me to take his place, so that I shall have the novel experience of giving away my daughter myself."

Of course, the wedding passes off beautifully and the guests keep their comments to themselves. They are not fools, however, and know ten times as much as they have been told; but they go away well-nigh forgetting all about the man in their admiration for the courage of the woman.

To go a little lower down in the social scale, everybody knows of the man who seems to do nothing thoroughly but drink whisky. He is the "dead beat," the "scalawag," the—anything you please. He is worthless generally, even if he has sufficient decency to keep out of jail. No matter—that man is as likely to have a good wife, yea, a "ladylike" one, as any other kind. To her he is "Mr. Short," and she considers him every bit as good as "Mr. Wharton." When the "smart Aleck" of a grocer's boy calls with a bill far too big (no matter whose fault it is), and airily shouts over the rickety fence, "Where's Jim?" this plucky little woman is ready for him.

"That's not our dog's name!" she declares with quiet dignity. "If you want to see Mr. Short, he's in the house. If you will come to the door properly, I'll ask him if he can see you."

The boy goes away in meditative silence; perhaps he utters a subdued whistle. Whatever he does, of this much he is sure—"Mr. Short's" veneering of respectability is a little thicker than people thought. Nor is this all. Mrs. Short sees that it grows thicker; the chances are that in the end it becomes quite a substantial coat. True, this is not always accomplished until the poor body is laid in the graveyard. No matter; Mrs. Short manages to appear in widow's weeds quite orthodox, which certainly complete the work, if anything can. Nobody thinks a whit the less of her or the departed for showing her crape and bombazine in church the Sunday after the funeral, even if she was never known to enter a church before. Nor does any one dare say she is a hypocrite if she asserts that "she is going to try to live better now so as to be able to meet Mr. Short again." Those who have doubts about Mr. Short's future, seeing that his past amounted to so little, are discreet enough to be silent, knowing very well that whatever they cannot understand, of this much they are sure: Women have unaccountable ways, and while women exist we shall see unaccountable manifestations thereof every day in the year. Like as not some prophetic soul, gifted with spiritual insight, will declare with all the force of conviction, "Mrs. Short is in earnest. She believes that her faith has saved him."

I don't know who may read these words—probably all sorts and conditions of women. Some don't live where "Anglo-mania" and "shoddyism" run riot, but I have lived in just such a place. I have seen so much thereof that I know how disgusting they can become. I honestly believe that they are more dangerous to American sentiments and American institutions than the general public imagines. Now, what am I driving at? Why, this: I believe that the young matrons of our beloved republic can set their faces like flints against these foreign elements and finally grind them out. How? Simply by calling their husbands by their proper names.

I don't like to hear the proprietor of a great building speak of the janitor as "Brown." It sounds too snobbish. The proprietor's father may have been even less respectable than "Brown." At any rate, "Brown" is as much a citizen of the United States as the proprietor of the building is; his vote is worth as much. And I don't like to hear small shopkeepers, mechanics, etc., spoken to in a similar manner. It is to be presumed that they have votes and souls. How much more has the railroad magnate got? When he takes a fellow-creature for a coachman and makes that coachman wear a steel collar to keep his neck straight, I think that the railroad magnate has a very small soul and a very small conception of the dignity of an American citizen. (However, *I* don't believe an American *would* wear a collar like a dog. Don't *you* begin to see why Americans won't perform our ordinary labor, and foreigners must be imported to fill their places? It is because they are robbed of their dignity and addressed as "Brown," if they do. Similarly, American girls don't like to be called "Susie," and told that they are not fit to sit at the same table with respectable people; but this opens another question.)

Now, my dear young friend, if you have a husband and he's nothing but a huckster; if he has nothing in the world but his horse and cart, let people know that to you he is "Mr. Jones," and you wish it understood. He is, or means to be, a gentleman just so far as his limited circumstances will allow. He is at least honest and respectable, he is a good citizen, and, for all anybody knows, he may turn out a successful business man, rich enough to be envied. Don't tolerate any such names as "Oyster Jack," or "Bill, the Cabbage Man." Plant your foot firmly and keep it so. Perhaps I ought to add, insist on being "Mrs. Jones" yourself. If you don't, before you are aware, all the children along Mr. Jones' route will probably know you as "Sally, Oyster Jack's wife."

Perhaps I have said enough. You catch the general drift of my remarks; your pride, your dignity, your delicate instincts will do the rest. Trust women to see the clearest, shortest way home!

A BUSY MANUFACTURING TOWN.—Mrs. Flora M. Kimball, writing in *The Great Southwest* of her late Eastern travels, says: South Bend, Indiana, was a most delightful resting-place. The amount of manufacturing done there is simply enormous. The famous Studebaker wagon and carriage manufactory gives employment to 1400 workmen, and turns out a wagon every six minutes of working-time during the year. The proprietors are making an addition to their buildings, giving 10 acres extra floor room. Oliver's Chilled Plow Works employ nearly a thousand hands, mostly Polanders. One shirt factory has 400 girl operatives; another 200. There are here also woolen-mills, paper-mills, and many similar industries that give life to the town, employment to a large population and a large amount of freight to the railroads. I found at South Bend a former *protege*, a pepper tree, that a lady took from my National home 20 years ago. It has had excellent care, spending its winters in the cellar and its summers in the owner's beautiful grounds, and has attained the hight of three feet!

A SMALL BOY, descended from a celebrated general of the Revolution, visited Independence Hall in Philadelphia with his mother. Wishing to impress upon him the good blood from which he had sprung, she pointed to an oil portrait and said: "See! there is a picture of your great-great-grandfather, hung by Gen. Washington." The child apparently took no notice of what she said at the time, being interested in the liberty bell and other curious things. But some months afterward, when distinguished guests were dining at his father's table, he broke an interval of silence by asking: "Mamma, what did you tell me in Philadelphia about my great-great-grandfather being hung?"

A NEW game among amateur photographers is called "the guessing bee." The photographers take a lot of pictures, and he who succeeds in guessing what they are supposed to represent is rewarded by not having any of them presented to him.—*Philadelphia Times.*

Domestic Economy in the Oregon Agricultural College.

In our issue of September 13th we gave views at the Agricultural College at Corvallis, Oregon, one of which was a group of pretty girls with white caps busily engaged in kitchen chemistry. At a farmers' institute at Grant's Pass last month, an essay was read by May Warren which gives further information in the same line as follows:

There is no department more in harmony with an agricultural college than is this chair of Domestic Economy; for the object of an agricultural college is to teach the boys practical knowledge concerning farm work and those studies that will make the farmer's labor an intelligent art, so that instead of the ignorant farmer who knows nothing about the composition of the soil, the conditions necessary for the development of the seed, we may have farmers who watch the germination of the seed with delight and take pleasure in the later growth and ripening of the grain and fruit, simply because they understand the conditions necessary for these changes. As this is the object aimed at in the education of the boys at the agricultural college, what could be more in keeping with this than to teach the girls the arts of cooking and sewing, which are fully as essential to a girl's education as the farm work is to the boys.

While in some countries the farmer and farm work are looked down upon and thought to be of a degrading nature, so also is the closely allied art of cooking; yet we know that in reality there is no work that may be of a more elevating nature than these. What could be more ennobling than continual companionship with nature, which shows forth the power and excellence of God? So let these occupations which are necessary to maintain existence be raised, by education, to the elevated position they deserve.

In the agricultural college the boys are taught the art of producing good fruits and vegetables and the girls the art of cooking them.

While the boys, after a three years' course upon satisfactory examinations, receive the degree of Bachelor of Agriculture, the girls, who take cooking and sewing along with the other studies required in the course after the same length of time, receive the degree of Bachelor of Economy.

During this three years' course the girls must become thoroughly acquainted with all the implements used in the kitchen, particular attention being given to the stove, which really bears the same relation to the art of cooking that the heart does to the circulatory system. A history of all the articles of food used is given, thus making cooking an intelligent art and adding a charm to the work, for if a woman knows that the tea she is using comes from Japan, the coffee from Mocha, and so on through the long list of articles used, food for intelligent thought is thus furnished and the work does not seem a drudgery, but intelligent and interesting.

The chemistry of food is also taken up, giving a knowledge of their chemical composition and the chemical changes which take place in cooking them. Now the object of cooking our food is to make it palatable and digestible. Physiologists tell us that there is nothing more injurious to our indigestion than poorly cooked food, and we know by the sympathy which exists between all the organs of the body that when one is diseased the workings of all are impaired, so for the sake of the general health and welfare and comfort of mankind every girl ought to learn the art of cooking.

Marketing is another very important branch taught; a knowledge of what to buy and how to buy is obtained, and how to distinguish fresh vegetables, meats, etc., from stale ones. Among the many other useful things taught, dairying and gardening are not omitted.

Not only the theory of cooking is given, but actual practice. The cooking of plain food is first taken up, how to set the table artistically. What could be more desired than a knowledge by which we may prepare the repast, however scant, so that it will be appetizing?

Later on in the course, instruction in cake-making and fine cooking is given, so by the time that the three years have expired each girl becomes a thorough master of the art of cooking. In addition to this, fully as thorough instruction is given in the art of sewing, a very important factor in a girl's education. Plain sewing, hemming, darning, patching, buttonholes, and lastly knitting and fitting is taught.

It is admitted by all that there is nothing so desirable as a pleasant home, but in order that the fireside may be a happy one, many duties are devolved upon the keeper of a home. The prosperity and pleasure of the entire household depend largely on the way in which these duties are performed; if they are done orderly and at the right time, everything will go pleasantly and smoothly, but if not the opposite is the result.

The poet has said, "Be it ever so humble, there is no place like home." Now this is true if construed in two ways; on the one hand there is no place so pleasant as a bright, orderly home, while on the other hand there is no place so loathsome as a disorderly home.

Since so much of the happiness of the present and future generations depends upon the girls of the present and future, should we not look well to

their education and teach them the real, practical lessons of life as well as the theoretical? Teach them cooking and sewing as well as German and Latin, for these are sciences as well as they, although they are not often looked upon as such.

To be able to make good bread, cake and pies at all times and know that if your ingredients are good you will never have a failure, requires more science than to give a geometrical solution of the right triangle.

The well-known adage that "a stitch in time saves nine" verily speaks the truth, and all housekeepers will vouch for its truthfulness; but if one does not know how to patch and darn nicely, she is apt to put this work off till the morrow; this does not make the doing of it easier, for each day brings its own duties. Thus one's work accumulates day after day, and it is never done up and in order. The condition of a woman's work has a marked effect upon her mind and temper, and she will gradually and unsuspectingly grow cross and irritable, till the house is anything but pleasant. While on the other hand, the skillful woman always does her work at the right time, has a nicely cooked meal when the men come from work, the house orderly, and a happy, pleasant face; all are in a large measure due to the faculty of knowing how.

Nothing has been said about the important feature of economy, however; this is aimed at in all of the instructions. The saying that "a woman can throw out more with her teaspoon than a man can bring in with a shovel," is very true.

So while we educate the lads of our land that they may be better farmers, let us educate the lassies that they may be better wives for the farmers.

Chaff.

VANITY is the besetting sin of women. Some women are as vain as men.

BECAUSE a man has climbed the ladder of fortune from its lowest rung is no reason why his praises should be rung in on us continually. —*Siftings.*

INTENDING PURCHASER: Is this an old horse? Horse Trader: I should say not. Who did you think was running this stable, anyway—George Washington?—*Drake's Magazine.*

AN ocean greyhound should be bark-rigged.

AN old and popular design in paper-cutters is the exchange editor.—*Binghamton Republican.*

NO mouse has ever caught a woman yet. Why all this trepidation?—*Dallas News.*

CUMSO: Jaysmith is penurious, isn't he? Fangle: I should say he was. He won't even laugh at a joke unless it's at some one's else expense.—*Epoch.*

THE difference between men's and women's ways is nowhere shown so plainly as in trouble. Where woman gives way to a flood of tears, man proceeds to put up a few strong dams.—*Terre Haute Express.*

COUNTRY SWAIN (timidly): Would you be mad if I asked you to be my wife? City Girl (briskly): Not at all; but I'd be mad if I said "yes."

"IT'S hotter than—" began the deacon, when the minister interrupted him with: "S h-h." But the deacon wouldn't be bluffed. "Than it was yesterday," he added.—*Pittsburg Commercial Gazette.*

CANVASSER: I have here a work— Master of the House: I can't read. Canvasser: But your children— Master of the House: I have no children (triumphantly). Nothing but a cat. Canvasser: Well, you want something to throw at the cat. (He took it.)—*Life.*

CAN a man be said to be unsexed when he is cowed?

"SCHOOLMASTERS were the original switchmen," remarked the horse editor. "Yes," replied the snake editor, "and they struck frequently, too."—*Pittsburg Chronicle-Telegraph.*

WHAT strange survivals of old forms of speech we constantly meet with! It is said, for instance, that there are still some old settlers in Chicago who refer to the Chicago river as "the drink."

"YOU haven't a pension?" queried the astonished Fenderson of the legless veteran who was scrubbing the marble floor of the corridor of the Bangup Building. "No, I hain't got no pension, and I don't expect to get none, neither," answered the veteran as he bent to his work. "How can you expect a man with no legs and one of his eyes most gone to hustle round with healthy men to get a pension? I tell you a man who is going to get a pension in the rush has got to be in first-class health and strong as an ox."—*Boston Transcript.*

THE ENGLISH LANGUAGE FAST BECOMING UNIVERSAL.—*Kuhlow's German Trade Review*, a leading German periodical, but which is largely read by business and literary men throughout the world, and which is published at Berlin, the capital of the German Empire, is printed in English. A late number of that journal, after referring to the great number of persons who speak various languages in Europe, sums up by saying: "The English language is now used by nearly twice as many people as any of the others, and this relative growth is almost sure to continue. This is the reason of *Kuhlow's* appearing in the language of the trans-Atlantic world—English." Forty or fifty years ago we heard it prophesied that the universal language of the world would eventually be the Anglo-Saxon, and we now believe it more firmly than ever.

YOUNG FOLKS' COLUMN.

One Afternoon.

Papa and mamma went out to row,
And left us alone at home, you know,
Roderick, James, and me.
"Now, dears," they said, "just play with your toys,
Like dear little, good little, sweet little boys,
And we will come home to tea."

We played with our toys the *longest* while!
We built up our blocks for nearly a mile,
Roderick, James, and I.
But, when they came tumbling down, alas!
They fell right against the looking-glass.
Oh, *how* the pieces did fly!

Then we found a pillow that had a rip,
And all the feathers we out did slip,
Roderick, James, and I.
And we made a snow-storm, a glorious one,
All over the room. Oh, wasn't it fun,
As the feathery flakes did fly?

But, just as the storm was raging around,
Papa and mamma came in and found
Roderick, James, and me.
Oh! terrible, terrible things they said,
And they put us all three right straight to bed,
With the empty pillow-case under my head,
And none of us had any tea.

—*St. Nicholas.*

Threshing-Machine Day.

"Here comes the 'Thrash-machine!' Hooray! Now we'll have some fun!" And Billy and Tommy and Ben and Sukey Mixer tumbled over each other out of the carriage-house where they were industriously cutting apples—and their thumbs likewise—to see the big green threshing-machine come lumbering into the yard drawn by Farmer Bean's yoke of oxen.

Threshing-machine day was a day always looked forward to with delightful anticipations by the little Mixers. The great fly-wheel going around faster and faster, the horses gathering to the work and plodding hopefully on, always up hill and never getting anywhere, the cruel, many-toothed beater devouring like some great hungry animal huge piles of wheat and oats, with a *whish* and a crunch, almost faster than the stout "thrasher" with a sponge over his nose could feed it, the clank and clatter and rumble of whirling cogs and wheels, making such a din that everybody had to shout at the very top of his voice to be heard at all, the dust that filled every cranny of the big barn like a dense brown fog, out of which grimy men would rush now and then, and in a moment be swallowed up in the thick stifling clouds—how delightful it all was!

The task of "doing apples" was mercifully suspended *this* day, so that the little Mixers might hang over the "lean-to" railing and take it all in with eager eyes. After a time they were promoted to "tramperr," and the whole troop bounced and tumbled and danced over the great bin of golden straw, every now and then, to get breath, sticking their little noses into the wide cracks of the barn, through which the bright sun streamed, turning the stifling dust to grains of gold.

But best of all was the long nooning when the tired men had all gone to the house up on the hill to dinner. Then they got up into "lag lane," as the children called the place where the horses walked, and digging their toes between the "lags" slowly turned the "power."

Just as they had got it well to going, "Squealy-ow," a big, long legged hog that was always jumping out of his pasture to nose about the granary, appeared at the barn door.

"Let's make him help us!" shouted Ben

"The old greedy!" cried Billy! "He's been at our dry apples! There's a string hanging out of his mouth!"

Away went all the little Mixers.

"Squealy-ow's" yoke stuck in the fence and in a trice, with the help of a rope, a stout switch and an apple, he was led up into "lag lane" and hitched to the bar.

"Now let's get 'Wall-eye' and have a span!" cried Tom.

"Wall-eye" was a huge, big-horned sheep that was hitched to a sweep out by the orchard. The next minute "Wall-eye" was dragged and pushed along up beside "Squealy-ow," with much angry stamping and many small nibblings from an ear of corn Sukey carried before him, and hitched by one horn.

The children rolled on the grass and laughed till they cried at sight of the odd pair.

"Wall-eye" didn't like "Squealy-ow," and every time he grunted he stamped his foot, and nodded his great horns threateningly at him if he but turned his long snout his way. At last he hit it such a thump that "Squealy-ow" broke out into loud lament, at which the children all scrambled for more apples to stop his mouth. Then they got in behind and set the "power" going. The "span" couldn't understand it and were balky.

Switch! Switch!

"Get up there!"

But "Wall eye" wouldn't "get up," neither would "Squealy-ow"—he shrieked at the top of his voice. In his present temper "Wall-eye" couldn't endure such a noise and began butting him in a great rage—*bump, bump!* at length tumbling him out of "lag lane," where he hung by his halter, his hind legs just reaching the ground.

The children now set up such a terrified scream that "Wall-eye" jumped after "Squealy-ow."

Crack went a horn, then "Wall-eye" got up and ran off, shaking his head and "grumbling" to himself,

Hearing the din, the men all ran to the rescue. "Squealy-ow" was cut down and he dashed off and hid himself under the cart-body. "Wall-eye's" horn, or the end of it, lay there with the rope hitched to it; but "Wall-eye" himself had fled to the great pasture where the sheep were, and the little Mixers had a time of it catching him again.—*Portland Transcript.*

P. T. Barnum's Advice to Young Men.

To young men who would "get on" in this world and reach the age of fourscore years, with happiness and prosperity, there is little more to be said; but I will refer them to a study of my own rules of action:

Briefly, I would say: Be honest; do not spend as much as you make; don't smoke or drink; depend upon your own personal exertions, and do not leave important affairs to a third person; don't have too many irons in the fire; do not get above your own business; and above all, be systematic. Advertise your business on all possible occasions, but attend to it, too, and see that your claims and promises made to the public are fulfilled. It does not pay to have a single customer go away dissatisfied, nor does it pay to take money for services for which you do not render an equivalent.

The best working years of a man's life are usually between 26 and 60; but much good work is possible long after the threescore-year mark has been passed. I can say, for myself, that every moment of my time is put to some definite purpose, and though I have numberless calls and demands, I enjoy a reasonable recreation each day. Both work and rest, and joy also, should make up the sum of a busy life.—*P. T. Barnum in Ladies' Home Journal.*

GOOD HEALTH

Health of the State.

By the report of the State Board of Health for August it appears that reports were received from 96 localities with an estimated population of 806,360, among which were 1065 deaths, an annual average of 15 84 per thousand, somewhat less than the report for the preceding month.

Among the principal causes of death, the greatest number, 157, were from consumption, an increase from last report.

Cholera infantum is reported to have been the cause of 76 deaths; this large percentage has been due to the average high temperature during the month.

Heart disease appears to be increasing; 63 deaths are attributed to this cause.

Pneumonia has claimed 41 deaths; a decrease of 10 since last month.

Bronchitis is credited with 29 deaths, 20 of which were in this city, over two-thirds of the whole number, although its population is but a small fraction short of one-third of the whole population reported upon.

A Fatal Neglect.

Under the head of diphtheria, a circumstance is recorded to which general attention should be called as a warning against similar neglect in the future, and as an evidence of the manner in which that dreadful scourge (diphtheria) is sometimes induced. We copy as follows from the report: From the latter city (Alameda) Dr. J. T. McLean reports 18 cases of diphtheria, nearly all of whom were attending one of the public schools. He says: "An old cement sewer laid 12 years ago in the block on which this public school is situated, wore out and caved in, thus stopping the flow of sewage from the residences and school in this block. The old sewer was taken up and replaced by a new ironstone one. The process of change from the old to the new sewer occupied a fortnight. During this time, sewer gas and disease germs escaped and contaminated the atmosphere in the neighborhood. The school children were more or less exposed, especially those whose curiosity drew them frequently and for a length of time to the vicinity of the sewer. The disease developed in these children, and it is believed this broken sewer, with its escaping gas and disease germs, was the exciting cause of this sickness. In one family, where three children had diphtheria, one of them dying, the plumbing and sewage were defective, the filth that should go into the sewer escaping into the cellar and contaminating the atmosphere of the house, from which the sickness and death in this family resulted. Other cases of the disease are of a mild type."

MILK INSTEAD OF MEDICINE.—Leading physicians are becoming bolder. Many have courage now to prescribe a certain diet instead of drugs. Is not the food an important factor in determining the character of our future lives? The infant whose mother drinks alcoholic stimulants while nursing it, will, three chances out of five, be addicted to the use of such stimulants when grown. A weary business man comes home from his office at night nervous and out of temper. A glass of milk heated to about 90 degrees, sipped a little at a time, and no food taken with it, or at most only a little bread and butter, will do more toward restoring him to a happy mind and good physical condition than all the tempting viands that can be placed before him. A lady in Platte county, Mo., was pronounced incurable. A well-known physician in Kansas City advised her to give up all medicine, and, in order to prolong her life, prescribed three ounces a day of a mixture of sweet cream and sponge cake. Inside of four months she was well.—*Ex.*

REMEDY FOR CHOLERA.—It is said that a remedy for cholera has been discovered by a Frenchman from Cette. People either attacked by or in fear of the disease must sit for some hours in a garment soaked in paraffine, which irritates the skin, producing a healthy reaction, and kills the cholera microbe. How can such a remedy act upon the cholera microbe securely ensconced within the most interior portion of the human system?

DOMESTIC ECONOMY

OATMEAL GEMS.—Two cups of the finest oatmeal, two cups milk, two eggs, one tablespoonful butter, one tablespoonful sugar, one saltspoonful salt.

JELLY TOAST.—Cut stale bread into neat rounds or squares; fry each slice in boiling deep fat; spread it thickly with some fruit jelly nd serve very hot.

STRAWBERRY AND BLACKBERRY PRESERVES. Pick and prepare the berries, put a pound of sugar to a pound of fruit. Sprinkle the sugar over and let stand several hours. Boil slowly half an hour.

TURKEY HASH.—Remove the meat from the bones of a turkey and cut it into neat bits; stir two cups of this into two cups of white sauce; season to taste. Make the stuffing of the turkey into neat cakes, fry them, and arrange them on the dish around the hash.

NURSERY MUFFINS.—Two cups milk, two cups fine bread-crumbs, one cup flour, saltspoonful salt, one egg, one tablespoonful butter, three teaspoonfuls baking powder. Beat the egg light, stir in the butter, the bread soaked in the milk, and the flour and baking powder. Bake in a steady oven, greasing the muffin tins well, so that the batter may not stick to them.

PICKLED BEANS.—String a quarter of a peck of tender green beans, throw them into a kettle of boiling water, add a teaspoonful of salt and boil 25 minutes. When done, drain in a colander, let stand until cold; then put into glass or stone jars, sprinkle lightly with cayenne, add a tablespoonful of whole mustard, a tablespoonful of chopped horseradish, and cover the whole with good, strong cider vinegar.

STUFFED EGGS.—These will be found very good for picnic or traveling lunch. Remove the shells from eggs that have been boiled hard, cut them lengthwise, take out the yolks, rub them fine with a little dry mustard, pepper and salt, and add a few drops of melted butter for each egg. Then put the stuffing back in the white of the eggs and put the halves together. The yolks should be removed very carefully, so that the traces will not be left on the white part.

CHOCOLATE-COCOANUT CAKE.—For the cake, one cup of sugar, one tablespoonful of butter, one-half cup of milk, two eggs, 1½ cups flour, one teaspoonful of baking powder. Bake in jelly tins. This will make two thick layers. For the filling, melt one-third of a cake of chocolate, add half a cup of sugar, three tablespoonfuls of milk and a half-teaspoonful of vanilla. Mix these ingredients until smooth, then add one-half a grated cocoanut to the chocolate and spread between the layers and on top.

TAPIOCA PUDDING.—Soak one-half cupful of tapioca for three or four hours in just enough water to cover it, then stir the tapioca in a pint of boiling milk. Beat the yolks of three eggs with two-thirds of a cupful of sugar and a bit of salt, then add this to the milk and tapioca. Take from the fire, and beat in gradually—a spoonful at a time—the whites of the eggs beaten very light, and set to cool; or the whites may be spread on top, and the pudding set in the oven till of a light, delicate brown.

SUMMER PUDDING.—Butter a plain charlotte mold and line it with neat slices of bread; then fill it up with any kind of stewed fruit (currants and raspberries, plums and apples, or apples and blackberries, etc.). Lay a piece of crumb of bread on the top, cutting it to fit exactly (all crust must be removed from the bread used for this pudding), and stand the mold in a cool place till next day; then turn it out, and serve with custard or cream poured over it. Choose juicy, well-colored fruit, so as to completely saturate and color the bread.

LITTLE SPONGE CAKES.—Break into separate bowls the whites and yolks of six eggs. Add six ounces of sugar to the yolks of the eggs and the juice of one lemon. Beat the yolks, sugar and lemon juice together till the mass breaks into bubbles; then add the whites of the eggs, which have been beaten to a stiff froth. The whites of the eggs must be stirred in carefully, so as not to break the mass down, and six ounces of flour must be added. The moment the sponge cake is mixed it must be poured into the small forms intended for it, which should be well greased, and just before they are set in the oven dredged with powdered sugar. Bake sponge cake in a steady but moderately heated oven.
